The committee also concluded that for handling mass transportation the electric railway is the most reliable and economical method now known, but that on account of the availability of buses for the special conditions above stated, the electric railways should be alive to the possibilities of bus operation—both in order to handle all the transportation needs of their community and by so doing to prevent wasteful competition by others entering the field due to the electric railways failing to utilize buses where the need for them exists.

Experience has shown that the motor bus amalgamates well with street railway transportation. It decidedly helps in providing a unified service in which the various companies are trying to provide street transportation. The menace of the jitney, although still present, has grown less. Particularly has it become apparent during the past year that after the street railway has installed motor bus operation the public has come to realize how much more satisfactory is the service than that previously rendered by various irre-

sponsible, poorly organized jitney companies.

This has been largely due to the adoption by the street railways of the best constructed and designed buses to be found on the market. They have been well maintained, cleaned, painted and run on schedules of frequent and evenly spaced headway from early in the morning until late at night. All this has been a welcome change in many communities.

The automotive industry has progressed in the past few years and is now developing passenger carrying vehicles of improved design. We are advised that the larger manufacturers of buses have appropriated large sums for the further improvement of bus design for passenger transportation service. There is a field in transportation in which these vehicles can furnish satisfactory service and traction officials should not allow an antagonism, aroused by jitney competition, to cause them to lose sight of the fact that it is their duty to supply transportation in the territory in which they are operating, and if extensions are required or present high costs of reconstruction necessitate the abandonment of any track, they should be quick to consider trackless transportation. The electric railways must keep pace with the development in the transportation field if they expect to continue to be the recognized distributing agency of the transportation commodity in their territory.

Failure on the part of traction companies to recognize and meet the above described situation will result as it has in the past in encouraging independent operators to enter the field and meet these service requirements. It is better for the traction companies and the public to realize fully that duplication of service is detrimental in that it results in a higher cost for transportation, making it desirable that the traction companies shall remain the transportation agency of the community, giving the public what it wants if the request is reasonable and the need apparent. Duplication of service is always ultimately paid for by the passenger and under proper regulation it is to the interest of the passengers that highway transportation shall be conducted as a unified whole.

From the results of experience in operating trackless transportation so far it must be appreciated that higher operating costs per seat-mile with buses justify a higher rate of fare in proportion, in compensation for any expedited service which may be possible by their operation.

Transportation is lacking in some places where lines have been abandoned on account of high costs of operation or of track reconstruction. The public formerly served by these lines feels that an injustice has been done the communities. Not only where lines have been abandoned but also in many local and country sections where highway transportation has never existed there is a growing demand for some service, and this demand is constantly increas-

ing where communities are stretching out into new territory and going through a process of natural growth. As the recognized distributors of transportation, the traction companies should be prepared to supply this lack. It must be realized, however, that it is incumbent upon sparsely settled districts to assist by caring for deficits until the service becomes self-supporting. Never again must the transportation companies and the riding public, who eventually pay the bill, be imposed upon for the purpose of land development exploitation.

The committee has five members who have served at least two years and whose companies are in the business of operating motor buses. In fact, of the thirteen members, ten represent organizations that have inaugurated motor bus operation.

The members of the committee are convinced that the motor bus has come to stay. It is a business proposition, not a theory. In fact, the use of buses where feasible is an established policy with most of the members of this committee. Committee reports have been made in many associations of street railway men and in the automotive industry. Technical journals have compiled statistics of every description. Two conclusions seem to be reached by reading these data and these reports, and from the committee's experience:

1. The electric car running on rails is still the most essential, reliable and economical method of urban, suburban and interurban travel, considering the transportation problem as a whole and especially for mass transportation. This condition arises largely from the fact that the operation costs per passenger are higher for bus operation than with electric cars, and from the further fact that it is not possible to handle mass transportation with buses.

2. The motor bus is needed to feed and supplement our car lines, to open up new territory; in fact, to complete, round out and make whole passenger transportation on the highway.

As stated by this committee in the past, it is our duty, as public servants charged with the responsibility for conducting the highway transportation in our respective communities, to adopt every feasible unit or method for furnishing this service.

The report was signed by J. H. Alexander, R. E. Danforth, B. J. Fallon, George Keegan, T. J. McGill, H. A. Mullett, D. W. Pontius, G. T. Seely, Claus Spreckels, R. A. West, H. B. Potter, vice-chairman; C. W. Kellogg, vice-chairman, and H. B. Flowers, chairman.

Uniform Motor Vehicle Regulatory Laws

During the winter just past there have been in session forty-five State Legislatures, and legislation affecting the operation of motor vehicles for the transportation of passengers and freight on the public highways has been passed in twenty-two states, which is of varying degrees of importance. Some of the states, such as Iowa and

Oklahoma, have passed general, full and complete regulatory laws affecting motor vehicle common carriers. Other states have merely amended certain sections of their present laws. In seventeen states a gasoline tax has been imposed upon all motor vehicles whether common carriers or not, making a total of thirty-six states now having such a tax. Ten states have increased their gasoline tax, the amount of the increase varying from 1 cent to 2 cents per gallon. The gasoline tax runs from 1 cent to 3 cents per gallon, the lower figure being the rate of taxation in the states of Arizona, Connecticut, Kentucky, Louisiana, Maine, Mississippi, New Mexico, North Dakota, Texas and Vermont and the higher figure the rate in Florida, Georgia, Oregon, South Carolina and Virginia. In seven states there was no attempt made to pass legislation affecting motor carriers. In six states legislation was attempted but failed. In the state of Wisconsin a bill has been drawn and reported favorably by the committee, which remains for the action of the Legislature.

There remain almost as many plans of taxation of motor vehicles and motor vehicle common carriers as there are state-taxing bodies. The complete plan of taxation per ton-mile of travel over and along public highways, as suggested by this committee in its report at the last annual meeting, was adopted in one state (Iowa), with the exception that the rate of taxation suggested was changed from 1 cent and $1\frac{1}{2}$ cents to $\frac{1}{2}$ cent and $\frac{3}{4}$ cent respectively. In one state (West Virginia) the taxation of motor vehicle common carriers is based on a prescribed sum per passenger seat-mile for passenger-carrying vehicles, such prescribed rate being higher for heavier motor vehicle units and lower for lighter units.

PLANS OF TAXATION CHAOTIC

In general, however, the plans of taxation remain chaotic, unscientific and unremunerative. As a rule the taxes in all states are much lower probably than the cost of maintaining highways damaged by motor vehicle common carriers. Until this situation has been corrected the public will be subsidizing the operation of these new transportation units.

In all legislation of a general character passed during the last winter, the requirement of a certificate of convenience and necessity before a motor vehicle common carrier can operate has been enacted into the laws. It is manifestly conceded by all parties concerned that such requirement is fundamentally sound. Also, in all states passing general motor vehicle legislation within the past year, liability insurance bonds to protect the public against injuries and damages have been required. This insurance feature, therefore, in addition to the certificate of convenience and necessity feature has apparently been accepted as basically necessary in any effective motor vehicle regulatory law. There has been some

divergence of ideas in the application of these two fundamentals, the insurance required in some states being somewhat less than in others and the character of the insurance being somewhat different. Certificates of convenience and necessity, while required in all new general laws, are issued under very stringent conditions and regulations in some states, and under less close requirements in other states.

There are a few fundamental ideas that must be secured in any new laws in order that regulation may be effective. First, certificates of convenience and necessity, making it unlawful for any motor vehicle common carrier to operate or commence operation until some state authority has consented to the operation of a common carrier by motor vehicle. Second, sufficient power lodged in some department of the state to supervise and regulate the rates, service, accounts, and safety of operations of every motor vehicle common carrier. Third, adequate insurance to protect passengers and public from injuries and damages caused by the operation of motor carriers. Fourth, a compensatory tax which will produce such an amount as will repair the damage done to highways by motor vehicle common carriers. Until a better plan has been devised, it is the opinion of this committee that there should be urged upon the public the necessity of taxing motor vehicle common carriers on the basis of the amount of use of the highways. To secure complete compensation for the use of highways by motor vehicle common carriers, every state should be urged to study this question on the basis of reducing the information to the point of how much damage a ton mile of travel does in cents and fractions thereof to each type of highway commonly in use. When that has been determined by investigation, the rate of taxation per ton-mile of travel can be accurately fixed. Until it has been determined the principle involved in the application of the ton-mile tax should be urged and the rate set at a tentative figure that will be certain to be sufficient. This may be done without particular detriment, because such rate may be changed from time to time as the studies advance without it affecting the sound principle of the ton mile tax. It is vital to all concerned that the present public subsidy in the shape of uncompensated use of roads be withdrawn from motor vehicle common carriers. Every taxpayer is interested in this and every other form of transportation is also interested in it. When such public subsidy has been withdrawn the rates charged on this new form of transportation must necessarily be fixed at such a point as will compensate their use of highways, and when this is done the present unfair and indiscriminate competition will be substantially curtailed.

It is gratifying to note that the draft of uniform motor vehicle law as proposed by the committee at the last annual meeting has been more or less

used in many states in framing new motor vehicle common carrier legislation. Many parts of such laws have been written quite largely from the tentative draft adopted by this association at its last annual meeting.

The report was signed by A. W. Brady, Ralph R. Bradley, David Daly, D. W. Pontius, B. E. Tilton, H. E. Chubbuck and C. D. Cass, chairman.

Construction and Maintenance of Highways for Motor Vehicles

The committee on cost of construction and maintenance of highways for motor vehicles was appointed in the year 1922, and sent to the electric railway company in each state located in or near the capital a questionnaire requesting certain data. The replies were not received in time for the committee to report at the 1922 convention; therefore, the committee was continued for the year 1923.

Replies to the questionnaire indicated that many states have not kept authentic records of the cost of construction or maintenance of their improved state highways and there was practically no record of costs in connection with county highways. The committee's information also indicated that many state highway departments which have not kept detailed cost records are starting to keep construction and maintenance costs which should be available in the future. Data on county highways probably will not be available for some years to come.

An examination of the tabulated data received by the committee shows that, with few exceptions, the costs of highway construction and maintenance have increased steadily from 1917 to 1921, due to the construction of concrete, stone-block or brick pavement types of road instead of macadam and to the recognized increase in cost of labor and materials of all kinds. Obviously, costs of highway construction and maintenance will vary widely in different states due to the differing climatic conditions and soils, types and widths of highways, varying costs of labor and materials and density and character of traffic.

In order to determine the annual cost to any state of its improved highways it is, of course, necessary to know the total amount of money invested in highways from which the interest, depreciation and other fixed charges thereon can be obtained. These charges, to which should be added the annual maintenance costs, will represent the total annual highway expense. The determination of the depreciation charges requires knowledge of the estimated life of each type of highway for the character and density of the vehicular traffic accommodated by it. Information of this character is not now available, although elaborate tests are being made by the U. S. Bureau of Public Roads, various state highway departments and educational institutions.

The committee presents in tabulated form the data received showing partial

figures of the construction and maintenance costs per mile for twenty-seven states, together with the mileage for the years 1917-1921 inclusive. The report says that it is realized that this information is not complete and in some instances may be inaccurate, but it gives a fair idea of average construction and maintenance costs for the years indicated. Figures as to motor vehicle registration and revenues collected by the U. S. Bureau of Public Roads are also included.

The conclusions of the committee are: That there now is a noticeable absence of accurate data on highway costs; that there is need of definite action on the part of the several states to obtain accurate cost data on the various types of road in use, in order that an equitable plan of taxation may be devised to meet the expense incurred through the increasing use of highways by motor vehicles.

The report was signed by J. S. Bleecker, C. M. Cheney, W. F. Graves,

Samuel W. Greenland, E. C. Johnson, E. P. Roundey, J. N. Shannahan, H. M. Steward, and W. J. Harvie, chairman.

CO-ORDINATION OF ELECTRIC RAILWAY AND BUS TRANSPORTATION

President Emmons then announced that the rest of the session was to be devoted to a consideration of the subject of co-ordination of electric railway and bus transportation. Papers were read by Alfred Reeves, general manager Automobile Chamber of Commerce; L. S. Storrs, president Connecticut Company, New Haven, Conn., and D. W. Pontius, vice-president Pacific Electric Railway, Los Angeles, Cal. These addresses will be found elsewhere in this issue. The meeting then adjourned, after Secretary Welsh had announced that the association had received from the United States Department of Commerce copies of its recent "Survey of Business." Copies of this survey were available to the delegates at the convention.

Wednesday's Session, A. E. R. A.

PRESIDENT EMMONS called the second session of the American Association to order promptly at ten o'clock Wednesday morning. The first order of business was the report of committee on nominations, which was presented by J. H. Pardee, chairman. The association acted on the report, electing the following officers for the ensuing year.

President, Britton I. Budd, president Chicago, North Shore & Milwaukee Railroad and Chicago Elevated Railroads.

First vice-president, J. N. Shannahan, president Newport News & Hampton Railway, Gas & Electric Company, Hampton, Va.

Second vice-president, F. R. Coates, president Toledo, Ottawa Beach & Northern Railway, Toledo, Ohio.

Third vice-president, W. H. Sawyer, president East St. Louis & Suburban Railway, East St. Louis, Ill.

Fourth vice-president, R. P. Stevens, president Republic Railway & Light Company, New York.

Treasurer, Barron Collier, president Barron G. Collier, Inc., New York.

The new members of the executive committee are: J. H. Hanna, vice-president Capitol Traction Company, Washington, D. C., and H. B. Flowers, president New Orleans Public Service, Inc., representing railways, and E. F. Wickwire, secretary Ohio Brass Company, Mansfield, Ohio, and Cornell S. Hawley, Consolidated Car Heating Company, Albany, New York, representing manufacturers.

J. P. Barnes, as chairman, presented the report of the committee on valuation. In view of the great importance of this report, it will be published in full in the JOURNAL next week.

The valuation report was discussed by H. M. Brinckerhoff, Prof. A. S. Richey and J. A. Emery. Mr. Brincker-

hoff called attention especially to the reference of the committee report to the yardstick method of making valuations. He stated that the form of valuation report and the method of proof are of great importance. We have reached the point where valuation engineers have had sufficient experience so that they ought to have somewhat standardized methods. However, he stated, there is very great diversity of methods, both with engineers and with commissions. It should be possible to state the physical facts so that these would not have to be brought out in testimony in hearings.

With the knowledge we now have of costs, it ought to be possible quickly to prepare a rough estimate of value with sufficient degree of exactness to make it acceptable in formal proceedings. As bearing on this contention, he cited the fact that a building contractor will figure the exact cost of a few of the major items and estimate the rest on the basis of cubical content, and he succeeds in doing business on this basis. There is no need to go into such great detail with utility valuation work. He stated we ought to be able to get engineers to agree on many factors and thus make it possible to get an estimate easily, which would be near enough for practical purposes. This ought to be driven home to both engineers and lawyers.

Mr. Emery called attention to the fact that the committee's report was unanimously agreed to by all of the members and commented that at the beginning of their work this was hardly thought to be possible. The principal controversy nowadays is between the reproduction and the prudent investment methods of valuation. Since the opinion of Justice Brandeis in the Southwestern Bell Telephone decision of the United States Supreme Court, a

good deal has been made of the investment method. Mr. Emery pointed out that this would mean that if a company had invested \$3,000,000 before the war in a piece of property and \$7,000,000 since then, it would have a total valuation of \$10,000,000. But he pointed out that this could obviously not be taken as a measure of the valuation, for the amounts of labor and material involved in the \$3,000,000 piece of work might be greater than that in the \$10,000,000 piece. His point was that the \$3,000,000 and the \$7,000,000 items are altogether different and cannot be added. If an effort is made to translate the present and pre-war values of the dollar to equivalent basis, then one is back practically to the problem of determining reproduction costs.

On the matter of depreciation charge, Mr. Emery stated that there has been a tendency in late years to assume that this was for the purpose of wiping out investment. He stated that this was entirely at variance with recent opinion of the United States Supreme Court. If a piece of property wears out the company is entitled to get that back in terms of present-day value. He acknowledged that there were serious accounting difficulties in this.

On motion, the convention adopted the report of the valuation committee.

W. R. Maltbie presented the report of the committee on special taxes by making a very able review of it. The report follows in abstract:

Special Taxes

In view of the fact that so many burdens carried by public utilities, and particularly by the electric railways, have been disguised under other names, it is necessary for any intelligent discussion of the subject that we have a definition of "tax." For the purposes of the present report we are regarding as a tax any charge imposed or service exacted which operates to the benefit of the community as a whole or to any part thereof, excepting such charges or services as react to the benefit of the users of the street railways in the ratio of their respective use.

With this definition of taxation in mind the committee prepared a questionnaire, and forwarded it to all of the member companies with the hope of determining definitely the full variety of tax burdens, and to some extent the total tax burden, carried by the industry. Replies were received from 113 companies and the following tabulation made.

Excess Profits Taxes—Excess profits taxes are, of course, no longer imposed, but the fact that in a number of cases the excess profits taxes imposed for the year 1917 and subsequent years have not yet been adjusted, and the further fact that the government still has a considerable period of time within which to review the returns for the later years of the operation of the excess profits tax law, fully justify, your committee believes, a discussion of the question at this time.

The street railway industry passed, in many if not most of our larger cities, through a period of consolidation. At that period security issues were not under the control of public service commissions, and accounting standards for the industry had not yet been unified and were to some extent undeveloped.

The minor companies owned in many cases valuable intangible rights and these, together with the anticipated increased revenue resulting from the economy and efficiency of consolidated operation, were capitalized by the promoters of the consolidation, in accordance with the then current business practice.

But an internal revenue department field agent, examining in 1920 or 1922 an income tax return for the year 1917, 1918, or 1919, can find nothing in his rules and instructions to cover such a situation and therefore is apt to slash millions of dollars out of the invested capital claimed by the company, change its surplus into a deficit, and finally present it with a bill for taxes on excess income.

Some of the cases have been adjusted and the companies relieved by the presentation of evidence establishing the value of intangibles and thus restoring to invested capital all or a part

of the amount wiped out by the field agents of the internal revenue department. In other cases the companies have decreased or set aside the levy for excess profits tax by showing that they were entitled to increase for the years in question the modest provisions made for depreciation, although the result (since under commission regulation comparatively few companies carry any appreciable surplus over from year to year) must necessarily be to seriously reduce the surplus or even to create, at least for income tax purposes, a deficit.

It has been suggested by some of the companies that it might be possible to handle this situation on the basis set down by Sec. 210 of the act of Oct. 3, 1917, whereby the deduction to be made can be determined by a comparison with standard concerns in the same line of business. Some work was done by our predecessor committee with the idea of assisting in such a movement, but the difficulty of finding representative companies whose returns had been already examined and pronounced satisfactory by the government, coupled with the difficulty of applying such a standard on account of the unstandardized character of operating conditions, led the committee to abandon this mode

SUMMARY OF TAXES PAID BY 104 ELECTRIC RAILWAYS		IMPOSTS	
DIRECT TAXES		Paving construction and paving repair and maintenance:	
Federal corporate stock tax (seventy-five companies reported).....	\$274,820	Paving construction (sixty companies).....	\$2,372,143
Federal income tax and state income tax:		Paving repair and maintenance (sixty-four companies).....	2,466,045

Real and personal property and franchise taxes (three companies).....	330,752	Bridge construction (ten companies).....	262,009
Gross receipts tax (fifty-one companies).....	\$3,101,276	Bridge repair and maintenance (thirty-four companies).....	216,692
Franchise tax and gross receipts (three companies).....	87,318	Traffic policemen (six companies).....	115,937
Total (fifty-four companies reported).....	3,188,594	Support of public service commission or other body or officer (twenty-five companies).....	172,291
Net receipts tax (two companies).....	1,796,568	Street lighting (thirteen companies).....	47,286
Licenses:		Free transportation of police, firemen, mail carriers and municipal employees:	
Car licenses (twenty-six companies).....	\$431,032	Police (seventeen companies).....	\$523,866
Pole licenses (nine companies).....	3,365	Firemen (thirteen companies).....	242,313
Wire licenses (two companies).....	2,260	Police and firemen (thirteen companies).....	472,119
Track licenses (seven companies).....	7,213	Mail carriers (two companies).....	473,306
Car and pole licenses (one company).....	717	Municipal employees (five companies).....	62,272
Car, pole and wire licenses (two companies).....	11,143	Total (thirty-one companies reported).....	\$1,773,876
Pole and wire licenses (one company).....	1,033	In addition to the above, forty-seven companies reported that they give free transportation to police, firemen, mail carriers or municipal employees but no record of the amount is available.	
Car advertising licenses (one company).....	125	Miscellaneous imposts (six companies).....	\$289,744
Total (thirty-five companies reported).....	456,888	Total imposts.....	9,394,258
Miscellaneous taxes (forty-six companies).....	826,128	Total taxes.....	34,304,554
Total direct taxes.....	\$24,910,296	Total operating revenues.....	358,530,280
		Direct taxes as percentage of operating revenue, 6.9 per cent.	
		Total taxes as percentage of operating revenue, 9.6 per cent.	

of attack; and, so far as we know, it has not been satisfactorily followed by any company in the industry.

DEPRECIATION

The difficulties which the companies are finding today since the repeal of the excess profits tax, arise chiefly out of a ruling of the department on the question of depreciation.

The government has always been willing in the administration of the income tax to allow as a deduction from income a reasonable sum based upon the estimated life of the unit of property in question. In the case of a corporation the department is disposed to insist that this depreciation cannot be allowed unless it is charged off against capital or set up upon the books as a reserve.

The rulings of the income tax division and the income tax law itself have been changed in this regard a number of times.

The present situation may be summarized as follows:

1. The present law and the act of 1918 make no requirement that the depreciation claimed shall be charged off.
2. The treasury regulations require that all depreciation claimed should be charged off, but that where it has not been charged off the books may be reopened and the proper allowance claimed.

3. Where on account of the payment of dividends in previous years there is no available surplus against which the proper credit to a depreciation reserve can be debited the allowance can still be claimed by writing it off against principal or capital. In such case the ordinary dividends in the years when proper depreciation was not claimed would seem to become a liquidation dividend in whole or in part and therefore under the revised ruling (Regulations 62, 1922 edition, Paragraph 1546) not to be subject to tax in the hands of the stockholders.

4. Banks, as a special class of corporations subject to federal or state control in their accounting, may carry supplemental books of account showing depreciation charged off without entering this charge upon the books required by state and federal authorities.

Conflict Between State and Federal Depreciation Regulation—In this matter of depreciation the electric railway industry, in common with other public utilities, finds itself in a situation somewhat similar to that of the banks. For income tax purposes the federal government allows a certain deduction of depreciation as an operating expense, the particular rates being subject to the approval of the treasury department. These rates are fixed or are supposed to be fixed on a straight line basis adjusted so as to accumulate by the end of the useful life of the various classes of apparatus the total difference between original cost and scrap value. A private corporation consequently, without fear of criticism, public or private, may adjust its rates so as to earn the full amount of this deprecia-

tion plus a reasonable return, distribute the reasonable return to its stockholders, and hold the full amount of the depreciation, without payment of any income tax thereon, as a reserve to be invested in expansion of the plant or elsewhere to benefit the stockholders.

The public utility, on the other hand, usually finds its appropriations to a depreciation reserve limited by action of the public service commission under which it operates and further finds its earnings limited to a fair return over and above the commission-fixed allowance for depreciation. If by chance the depreciation allowed by the commission is equal to that allowed by the income tax department of the federal government, the dual control introduces no difficulty, but if, as sometimes happens, the depreciation allowance set up by the commission is less than that allowed by the federal government, the utility must either accept the depreciation allowance as limited by the commission and therefore pay to the federal government an income tax upon earnings which would be tax free with a private corporation, or else make up the difference between the commission depreciation and the income tax department depreciation out of its net earnings applicable to fair return, and in the latter event either decrease the return to its stockholders below the fair return allowed by the commission or else treat a part of this fair return as a liquidating dividend resulting in depletion of capital and impairment of credit. It would seem desirable, therefore, that the industry should attempt to secure a special ruling similar to the bank ruling above noted.

INCOME TAX BUREAU'S ATTITUDE

The situation outlined above, common to all public utilities, is further complicated in the case of the electric railways by the attitude of the income tax department toward depreciation of way and structures. If a company has been in existence for a number of years and has a large quantity of diversified trackage, it is probable that the lapse of time has brought about such an equalization of replacement charges that the tracks and right-of-way structures are maintained in status quo by a practically uniform annual expenditure on maintenance and replacements. It is therefore unimportant from the accounting and financial point of view whether (1) a part of this necessary annual sum is appropriated first to a depreciation reserve and then charged out of the depreciation reserve for major replacements, or (2) the entire sum is charged directly to maintenance without the intervention of a depreciation reserve account.

The Interstate Commerce Commission therefore in making up a standard system of accounts for electric railways (which system has been adopted by many if not most of the state commissions) has left it optional with the companies whether they will carry a depreciation reserve for way and structures or will maintain them in full

operating efficiency by direct charges to maintenance for such replacements as may be necessary.

In the steam road case arising under the act of 1909 the court ruled that the depreciation of the roadbed and of the structures connected therewith must be treated as a whole. The jury under these instructions found no depreciation, and the decision thus reached by the lower court was upheld by the Court of Appeals. The expense of keeping the road in repair and of making replacements had, of course, been claimed and allowed as maintenance.

Basing its action apparently upon this decision, the income tax department is refusing to allow to electric railways any depreciation on way and structures, thus practically forcing the industry to adopt the second of the alternatives allowed it by the Interstate Commerce Commission.

In all cases where the diversity of the items which enter into the account, the magnitude of the plant, and its age have in combination produced an equalization of renewal charges from year to year this ruling works no hardship, but in all other cases it is apt to result in a distinct financial injury to the utility.

It is the feeling of the committee, therefore, that the association should attempt to secure a revision of the ruling of the income tax division so as to leave to individual electric railway companies the option allowed them by the Interstate Commerce Commission.

STATE AND LOCAL TAXATION

Besides federal taxation as discussed above the street railway industry makes contributions to the state, to the county, in the case of interurban or suburban lines, and to the local municipality or other taxing district. The burdens imposed under this head may be divided into three broad classes:

1. The usual tax on real estate and personal property, paid in common with all other citizens of the state, whether individuals or corporations. In this class would also be included state income taxes. This first class represents the same type of burden as that imposed upon general corporations or individuals.

2. Special types of taxes not applied to the general corporation but either to utilities as a class or to the street railway as a special type of utility. In this class may be included taxes upon so-called intangibles, and upon franchises or easements.

3. A long list of special burdens imposed upon the transportation industry and not imposed either upon private citizens, general corporations or other utilities. These special burdens for the most part consist in the requirement that the utility shall render free service either to certain groups of citizens or employees or shall perform individually at its own expense certain pieces of public work. They are taxes in that they are expenditures which would otherwise be paid for out of the public purse and are therefore,

to the extent of their cost, just as distinctly a tax burden as a definite rate imposed upon real estate.

No special consideration need be directed to taxes of the first class.

It is hard to lay down any general theory of taxation based upon equitable considerations which will justify taxes of the second class. There is certainly no basis for imposing upon the public utility a greater tax burden than is borne by the average normal corporation. The second class of taxes, therefore, must be justified, if at all, upon either practical considerations or as a historical survival from times when they had a practical economic basis.

But it should be noted that in cases where some such historical or practical justification may be adduced it is the justification of a gross receipts tax as a substitute for the flat property tax to which an ordinary corporation is subjected, and in no sense a justification of a gross receipts tax super-added to a flat property tax, except possibly in those cases where the gross receipts tax is contractual in its character and partakes of the nature of a payment for the franchise.

The justification of franchise or easement taxes demands also the assumption of conditions which existed at one time in the history of the industry but exist no longer. Given a street railway, for example, which enjoyed a legal monopoly of mass transportation at a fixed rate under which it was able to make large profits upon its invested capital, it was not illogical for the public to reason that these large profits were possible only because of certain exclusive rights in the public street, that these exclusive rights, protected by law, became valuable property which was in itself profit-producing to the owners of the utility, and that therefore it was not inequitable that they should pay a tax thereon.

But, given a complete change of the theory of operation by which the profit-producing character of the exclusive right is destroyed and the profit limited to only a fair return upon the property owned exclusive of the franchise rights, the justification for the franchise tax is destroyed and instead of being a levy upon the stockholders in proportion to the value of property owned by them it becomes merely an indirect burden placed upon the users of the utility for the advantage of the general public.

BURDENS IMPOSED BY PUBLIC

Taxation of the third class, consisting of various service burdens laid upon the utilities for the benefit of the general public, sub-divides at once into two sub-classes according as the tax in question was or was not justified.

The nature of this classification will be perhaps clearer if we will consider first the distinction between a true operating or construction charge and a public burden. If, for example, it is desired to extend a street railway system over a street already improved with a high-grade, modern pavement, the cost of cutting through this pave-

ment and restoring the street to its original condition is a construction cost properly chargeable against the users of the street car service. Moreover, if from time to time it becomes necessary to open the pavement at certain points, the cost of such opening, together with the cost of restoring the pavement to its original condition, is a true operating charge made solely as an incident of operation and properly chargeable to the users of the utility.

If, however, on the other hand, the street car line precedes the pavement, operating over an ordinary road which the municipality decides to improve with a modern pavement; or if the pavement finally wears out under ordinary traffic conditions and it becomes necessary to repave, such repavement or such new pavement cannot properly be charged as either a construction or an operation expense. If the presence of the track increases the construction or maintenance cost of the pavement, the excess may properly be charged to the railway. If more than this is charged, it becomes merely a burden upon the users of the utility service for the benefit of the general community.

Returning to our two sub-classes of the third type of public burden we would note that the first and most important item in the first sub-class, namely, the class of those which were historically justified at the time of their first imposition, is the matter of paving construction and repair. In the horse car days the transportation companies found paving essential and were, in turn, one of the heaviest users or consumers of paving surface. It was therefore, to this extent at least, logical to require the companies to construct and to maintain the paving within the track space.

But even in these early days the other side of the situation seems to have been entirely overlooked. While it was true that the street railway traffic did wear out pavement and should therefore be charged with renewal costs as an operating expense, it is also true that other vehicular traffic, attracted to the rail as an iron tramway, assisted in the wearing out of the railway rail, acted as an interference with railway traffic, and contributed perhaps even more than the railways themselves to the wear of the pavement within the track space. It would seem therefore logical that the street railways should have claimed out of the general tax levy a credit for public service rendered as an offset against the admittedly logical charge for pavement outworn.

Today there is no longer any logical basis for any pavement cost whatever, except that purely incidental to and resulting from the operation of the cars over the tracks. The street car rider is paying a portion of the expense of providing a smooth pathway for the pleasure rider, the commercial truck, and even the jitney competitor.

The second sub-class consists of those public burdens which were never logically justified by any relation to

operating cost. There is no logical reason, for instance, why the users of the street car system should pay for the transportation of the public police.

All of the public burdens of this second sub-class originally found their justification, so far as they could be justified, in purely practical considerations. The railways were operating under fixed rates of fare determined by charter or by act of the legislature. They were believed by the public to be extremely profitable businesses, and any additional burdens which could be loaded upon them, either with or without their consent, represented a transfer from the pockets of the stockholders to the public coffers and by so much decreased the general tax rate and the burden upon the general public. In other words, these burdens were a tribute paid by the operators of the transportation system as the price of non-interference by the public with a situation or business which it was believed would, even then, remain profitable.

REGULATION HAS CHANGED SITUATION

With the development of commission regulation, however, the entire situation changed. The business no longer operated upon a fixed charter or legislative rate but under a rate subject to constant modification by a commission operating on the theory of allowing only a fair return on fair value and allowing this fair return in addition to all operating costs, including both direct and indirect taxes.

In consequence of this changed theory of operation there was an immediate transfer of the public burden from the shoulders of the stockholders of the property to the shoulders of the users of the utility service. The more perfect and automatic commission regulation becomes, and the more frequent the rate adjustments, the more complete the transfer of the burden, until today in many states the street railway, instead of being a genuine taxpayer, has become merely an instrument by which a considerable percentage of the burden of public administration and public protection is, under the disguise of a charge for service, collected for the benefit of the people as a whole from the users of utility service, and even from them not in proportion to their need for public administration and public protection but in proportion to their use of the facilities furnished.

The inequity of this condition which, be it noted, does not operate to the injury of the street railway stockholder, has been still further heightened by the development of transportation other than the electric railway.

It is the opinion of your committee, therefore, that all taxation or public burden in addition to the taxes imposed upon other corporations, imposed upon a transportation system under public utility regulation, is inequitable to the users of the service; and that it is also injurious to the street railway system in that it introduces an unnecessary cost into the operation of the road and by so much increases the difficulty of

developing proper public relations. We recommend, therefore, that our member companies give full publicity to the existing situation with regard to public burdens and co-operate with the users of their service in an attempt to have the public burden properly distributed over the general public.

Public utilities as a class should be able to make out a strong case for preferential treatment at the hands of the taxing authorities. Commission regulation sets a maximum rate of return slightly above the legal rate of interest. Practical economic considerations at the present time are holding the net return of many of the street railway companies at an even lower figure. The riding public, therefore, who are the real users of the street car investment, would seem entitled to claim the same low tax rate as, for example, the security holders or the bankers.

On the other hand, public utilities as a class and the street railways in particular play an absolutely essential part in the development of community wealth. They would seem, therefore, entitled to claim as favorable treatment as a manufacturer or merchant, particularly in view of the fact that the merchant or manufacturer, taxed upon his invested capital and turning over his invested capital from three to five times per year, is compelled to increase his sales price by only one-fifth to one-third of the tax percentage, while the utility, requiring by the nature of its business from three to five years to make a single turnover of its invested capital, must increase its sales price to its ultimate consumer by from three to five times the tax percentage.

Sooner or later the public itself will object to public utility taxation in excess of that imposed upon other corporations of no greater importance to community growth. If public utility regulation by commissions becomes thoroughly effective; if the owners of the property represented by the stock and bondholders, are limited to a fair return as compensation for the accumulated wealth devoted to the public service; and if the tax imposed has no effect whatever upon reducing or increasing the income which these owners receive; the next step in logical development is for the users of the service to refuse to bear an excess share of the public burden because the nature of their business or their habits of life compel them to make use of the utility.

There is another reason for the discussion of this problem, apart from the interests of the street car companies and the interests of its patrons. One of the most serious problems of the day is that of municipal, state, and federal extravagance. The check upon public extravagance is to be found only in a demand on the part of the public for economy, and one of the first and most important steps in the development of this public demand is the elimination of indirect taxation. The tabulation shown in this report indi-

cates that approximately 10 per cent of the gross receipts of the street car companies of the United States is devoted to some form of public burden. The average fare at the present time is 6.92 cents or, in other words, an average of nearly two-thirds of a cent out of every street car fare collected in the United States is an indirect tax upon the street car users for the benefit of the general public.

The average workman riding to and from his work three hundred days in the year pays in this one item an indirect tax of approximately \$4. If this indirect tax and other numerous indirect taxes which he pays could be bundled together with the relatively small direct tax which he is called upon to meet, labeled, and known to him as a tax, we would find a pressure for public economy making itself evident at the polls in unmistakable fashion.

While no such radical action on public utility taxation is to be immediately anticipated, your committee is convinced that the present nation-wide study of the whole tax problem must lead to important changes, and that our member companies should adopt a uniform attitude and aid in the early development and adoption of an equitable and intelligent scheme of public utility taxation.

The report was signed by Edwin Gruhl, A. G. Neal, A. M. Robertson, H. B. Sawyer, Paul Shoup, and W. H. Maltbie, chairman.

President Emmons gave credit to Mr. Maltbie for having secured the return of several hundred thousand dollars paid in taxes by the Baltimore company, and stated that railway companies in trouble should know that there is a way to get relief.

F. W. Doolittle presented a very able paper on "Essential Operating Costs." This appears elsewhere in this issue.

MR. DALRYMPLE GIVES TALK

James Dalrymple, manager Glasgow Corporation Tramways, who attended the convention all the week, gave a brief talk before the American Association Wednesday morning. He was reminded, he said, that when he first visited the United States some twenty years ago, he was looked upon with suspicion because of the municipal operation of the Glasgow Tramways. He added that the question of municipalization was then very much to the front in this country.

It is now thirty years since Glasgow began the operation of its railways. The occasion for that was the expiration of the company's franchise. The city tried over a long period of time, he said, to come to some reasonable arrangement with the company, but the company then operating was so short-sighted and so arrogant that the citizens finally gave up hope of reaching any reasonable settlement and had to take the property over and operate it. If the street railway in Glasgow had been operated then as the railways of this country are now being operated, he said, he doubted if it would have been

taken over by the city, at least at that time.

The operation in Glasgow was successful almost from the start, and it was this that gave great impetus to the spread of municipal ownership in Great Britain, where about 100 railways are now municipally operated.

Mr. Dalrymple said that municipally operated companies there had had their ups and downs and had had to fight for their existence. He said that we are discussing the same subjects here as they are in Glasgow, both as to revenue and operating expenses. The railways there had to increase their fares in practically every instance. The statutes formerly limited most of the railways to a 2-cent a mile maximum rate. Many of them which were operating for less money have had to raise to the maximum and many others which were operating at the maximum had to go as much as 100 per cent over the 2-cent rate. Very few fares have been reduced. There has been a large increase in the cost of wages and materials. Materials are two to three times above the pre-war cost there, and wages are about 100 per cent higher.

Mr. Dalrymple commented that since he was here last, ten years ago, he has noted a remarkable improvement in all of the companies visited on his present trip. He said that the railways were in very much better condition than ten years ago. He observed that the railways here are considering their obligations to the citizens in the United States more than ever before.

As to the principle of municipal ownership, he said that they had a feeling in Great Britain that if the citizens of a city say they want to run the street railways themselves, they ought to be allowed to do so. If any city decides that this is the right principle to follow, then it must pay to the company, of course, full value for what is taken over.

Charles E. Elmquist, formerly chairman of the Federal Electric Railways Commission, presented a paper in which he reviewed some aspects of the commission's work in the light of the experience of the last four years and made some suggestions for the benefit of the railway industry. Mr. Elmquist's paper appears elsewhere in this issue. His paper was prefaced by some most interesting discussion of the political situation in Minnesota, as a result of which he left his audience with the feeling that in spite of recent elections, the integrity of the people of Minnesota is not in danger and that conditions there are fundamentally sound.

A COMMISSIONER'S FORUM

Following the address by Mr. Elmquist, the convention had the pleasure of listening to addresses by five public utility commissioners: Dwight N. Lewis, member Iowa Board of Railroad Commissioners and president of the National Association of Railway and Utilities Commissioners; Henry C. Attwill, chairman Massachusetts Department of Public Utilities; Charles C. Marshall, member the Public Utilities Commission of

Ohio; Lewis E. Gettle, chairman Wisconsin Railroad Commission, and William Milnes Maloy, chairman Public Service Commission of Maryland. These men discussed both the specific

situations in regulation in their several states as well as general regulation problems. Abstracts of their remarks are presented in a symposium elsewhere in this issue.

Thursday's Sessions, A.E.R.A.

THE final session of the American Association was called to order by President Emmons on Thursday morning. C. L. Henry, Indianapolis, presented a proposed revision to the constitution and by-laws, providing as follows:

Proposed Addition to Article VI (d) to follow at the close of this Article.

If a meeting is held without a quorum present, the action taken at such meeting will be deemed legal and binding, the same as if a quorum were present, if the minutes of such a meeting are approved at the next subsequent meeting at which a quorum is present.

On motion the meeting adopted the amendment.

F. R. Coates presented the report of the committee on publicity, an abstract of which follows.

Committee on Publicity

A report of your committee on publicity of necessity must overlap somewhat on the work of the special manufacturers' committee on co-operation, the committee of one hundred and the accident prevention committee. This is because the work of all of these committees and that of the advertising section, through which all our publicity and advertising work clears, are very closely co-ordinated.

Epitomized, the work of the advertising section touches the advertising and publicity fields of electric railway and manufacturer companies, all daily and weekly newspapers in the United States, and the state committees on public utility information. All told, the section is co-operating with about 1,000 publicity and advertising men throughout the country who aid in the gathering and dissemination of good-will material.

One of the most important functions of the advertising section is to make available to newspapers, magazines and other publications facts about the electric railway industry. The committee's efforts have been to render a genuine news service to the newspapers and magazines, and proof that it has accomplished this endeavor is found in the fact that all statements and stories that it has released have been used generously by the large press associations serving the daily newspapers, the weekly newspapers and magazines. It never has offered for release a single statement which has been refused publication on the ground that it was colored or biased, or rejected on the charge that it was for propaganda.

News material has been released very

largely during the last year through two main channels, the national press associations for the daily newspapers, and the state committees on public utility information for the weekly newspapers. Direct mailing to newspapers, except when news material of only local significance has been offered, is not followed for the dual reason that if a statement has news merit, it will be handed to the larger papers by the national press associations, and the state committees will take care of the smaller papers. Editors are overburdened with news releases and the committee seeks to aid them by avoiding direct mailing.

Special emphasis is laid by the committee on the fact that electric railways have two things of interest to newspapers—news material which has facts of general interest to the public, and advertising material, which may have news interest, but primarily belongs in the paid space sections of the papers. There is no reason in your committee's opinion why any newspaper should publish material belonging in paid space in its news columns, and the committee not only exercises great care to keep such material out of its news releases, but also urges individual companies to follow the same course.

At different times during the year larger newspapers of the country have carried news releases supplied by your committee dealing with: Growth of the electric railway industry in the last thirty years. Financial problems of electric railways. Public relations. Reviews of all major phases of the 1922 electric railway situation by the president of the association. The industry's need for more men. Electric railway financing. Trackless transportation. Need for uniform motor vehicle laws. Maintenance and construction of highways. Interest of the car rider in electric railways. Failure of the 5-cent fare in Seattle and of buses in Saginaw, the weaknesses of municipal operation and various other news stories. Your committee believes that all of the news statements previously mentioned were of a constructive character, calculated to aid in maintaining good local transportation for the benefit of the public generally.

The committee wishes to say that one of the first things that every state committee should do—and most of them do—is to urge paid advertising upon utility managements. Advertising does pay, and utilities should pay for everything that is properly classed as advertising. If you think you can go into a state committee and get free

advertising into the newspapers which should go in as display, you had better stay out. It can't be done, and no fair-minded utility man should ask it—unless, of course, he is willing to give free street car service, electric lights, heat, water and telephone to papers just as he asks them to give away their space for something which is not news.

The advertising section has co-operated with the special committee on manufacturers' co-operation to a greater extent during the last year than ever before. Under the general direction of Chairman Wickwire the section has not only supplied material to the manufacturers for use in their good-will work, but also has helped conduct an intensive organization campaign for them. At the beginning of the present fiscal year only a few manufacturers were doing any good-will work for electric railways or had gone on record as being willing to do it but now approximately one hundred companies are enlisted in the cause.

Under a special working agreement between the Association and the committee of one hundred, part of the time of Fred C. J. Dell, director of exhibits, is allotted to this work.

The committee on publicity can think of no effort that would be more helpful to its endeavors as a continuation of the work of the manufacturers' committee as it has been carried on during the past year.

BULLETINS AND POSTERS

Once a month the advertising section, under the direction of your committee, issues a bulletin called *Truth*, which contains current information regarding movements in the electric railway field, consisting of brief news stories, editorial comments, etc.

This bulletin, which is prepared by the director, in a non-technical style, is particularly valuable to state committees on public utility information and electric railway companies and manufacturer companies having house organs.

In fact, much of the electric railway material, not of a strictly local character, which is found in clip sheets of the state committees on public utility information and the forty or more electric railway company publications which are printed in the United States is taken from *Truth*.

Truth not only circulates among these committees and companies, but also is sent to various organizations which use it as a reference or place it on their bulletin boards to be read by employees and others. The total monthly circulation of this bulletin is about 3,000.

At the suggestion of the committee on publicity, the director of the advertising section has been co-operating with the accident prevention committee in the preparation of poster and advertising material designed to decrease accidents.

The services of the advertising section to electric railway companies fall into two general divisions. The first

is rendering a regular bulletin poster and suggested advertising material service to companies as a part of the routine and the other is to render special advisory service in local situations.

The committee has been pleased to note during the last year a growing tendency on the part of companies to avail themselves of this special advisory service. Scores of special requests have been made to the director of the advertising section for his advice and suggestion, and many companies, particularly, the holding companies, have sent their publicity men to New York to confer with the director on special problems, such as motor competition, paving taxes and merchandising transportation. Various companies, contemplating the organization of publicity departments, also have conferred with the director for the purpose of ascertaining the requirements of such a department in the way of personnel, finances, and so forth.

By virtue of being in close contact with all the publicity departments of the electric railways of the country, the director is in a position to give suggestions on almost any phase of a publicity or advertising problem. He can and will quickly give information as to what are the best methods of organization and of conducting a public relations department.

The services of the director also are available for companies having big problems of sufficient importance to warrant the director making a trip to the property. Whenever possible his personal services on the ground will be made available for limited periods.

The report includes a list of companies which are using company publications in their publicity work.

RECOMMENDATIONS

The committee believes that its activities should be continued along the general lines heretofore followed and every executive in the industry should lend his hearty support to the section's work, not only by having his advertising men co-operate with the section, but by following its work himself and offering suggestions and advice. The committee believes that the greatest weakness in the public relations machinery of the electric railway industry today is the failure of executives to present their stories personally to the public. There should be more speaking done at state and national gatherings by men who are familiar with electric railway problems. The committee strongly urges that particular attention be paid to developing this feature of its work during the coming year.

The committee has under way the development of increased service, in the way of posters, suggested newspaper ads and articles for interurban roads, and it strongly urges that this work take precedence over everything else at the beginning of the new year. The committee believes that the taxation problem particularly on city lines is one of the biggest before electric rail-

ways, and it suggests that the efforts of the advertising section early in the year be directed toward the preparation of posters and other material designed to place the outstanding tax burden facts before the public. The industry is suffering greatly from pleasure cars giving lifts to prospective customers of electric lines and some advertising material dealing with this situation might well be prepared.

The committee strongly recommends closer co-ordination between the members of the manufacturers' committee and the committee on publicity of the association. If they will strike at the same phases of our problems simultaneously, much lost motion will be done away with and better results obtained.

The report was signed by P. S. Arkwright, J. F. Collins, P. H. Gadsden, L. E. Gould, F. T. Griffith, A. A. Hale, G. A. Richardson, L. S. Storrs, Elton S. Wilde, F. R. Coates, chairman, and Barron Collier, vice-chairman.

John T. Staub, Baltimore, presented the report of the committee on insurance, which follows in abstract.

Insurance

This committee has had several meetings during the course of the year and is compiling data from a questionnaire sent out on the subject of fire insurance. At this writing the data are not available for this report. The committee therefor has deferred any recommendations on this subject until it has obtained from member companies a full and complete report on which to base its conclusions. It has thought best, however, to suggest in this report certain recommendations which will ultimately assist in securing both a better rate and greater fire protection, as follows.

Fire Insurance—1. Inspection System—A system of inspection to be established and maintained, covering all locations and property of the company. This system of inspection to include the following:

(a) Regular monthly reports from the chief employee at each location.

(b) Inspections by a competent man from the head office to check the reports of local chief employees, report any additional information of value in fire prevention or rate reduction and review the fire-fighting organizations.

(c) Inspections and reports by insurance inspectors furnished by the insurance brokers or by insurance bureaus with the object of checking the work under (a) and (b), keeping standards up to the times and giving the insured the benefit of advice as to the latest practices.

2. Fire-Fighting Equipment—With any needful advice from insurance experts each location to be provided with the proper fire-fighting equipment.

3. Fire-Fighting Organization—At each location where practicable, fire-fighting brigade to be formed, instructed and drilled under competent advice.

4. Signaling System—Also, under competent advice, suitable local or central station signaling system, or both, to be installed at proper locations.

5. Analysis of Insurance Cost—For each location, that is, for each risk having its separate insurance rate make-up, a sheet to be made up showing make-up of insurance rate, annual insurance cost and estimated cost of elementary certain charges, and a book of such sheets, covering all the locations of the insured, to be submitted to the management of the determination of the practicability of removing or reducing the various hazards and charges.

6. Adoption and Enforcement of Rule as to Building Changes and Construction—The rule to be adopted and enforced that any plans for changes in buildings or for new building construction are to be submitted to proper experts on rates and risks.

7. Blanket Insurance—As a general rule blanket insurance to be obtained where available.

8. Valuations—That complete detailed valuations be made of property at each location, based upon carefully determined unit values, and upon carefully determined depreciation rates for the various items of property.

The following recommendations have also been made:

If pits are not standard, particular stress should be made on keeping them clean.

If stairs are incombustible, they should be properly cut off.

Tracks should run clear from building without break or transfer table, and should have bumpers so that there would be a clear space of not less than three feet between bumpers and wall of building, and not less than five feet between tracks and side walls.

All rails should be bonded.

Cut-off and trolley switches should be installed covering each section with a circuit breaker.

Proper attention should be given as to leaving trolleys in contact when cars are not in service, while stored in barn.

Metal lockers should be installed.

Hose should always be attached to standpipes and be tested out every thirty days.

The committee believes that the property adopting the recommendations and fully complying with them will secure greater protection and ultimately obtain a better rate.

Fidelity Insurance—Replies have been received from nineteen member companies to a communication sent to a selected list, requesting information over a period of ten years relative to the amount of such insurance carried, premiums paid, losses and number of employees. From a compilation of the information contained it will be noted that over the ten-year period the average ratio of losses to premium is only 18.1 per cent. It will also be noted that of the nineteen companies reporting only seven of them bond platform men. The lowest rate obtained for fidelity insur-

ance by the companies reporting is 15 cents per \$100 obtained by the Springfield Street Railway, Massachusetts. All the other companies are paying a rate of 20 cents or higher. While these figures would seem to indicate that even a rate of 20 cents is too high for the risk involved, the costs of carrying the insurance are also exceedingly high. It is felt, however, that the committee should point out that the rate of 20 cents per \$100 is standard for this class of insurance and that they should be able to obtain such rate.

The following is a summary of information compiled from answers:

Number of companies replying.....	19
Period.....	1913-1922
Aggregate platform men.....	\$18,958,400
Aggregate other employees.....	\$36,396,890
Total.....	\$55,355,290
Total premium.....	\$140,119.65
Total losses.....	\$25,391.69
Average cost per \$100.....	\$0.253
Ratio losses to premium, per cent.....	18.1

The sub-committee is inclined to recommend that the practice of bonding platform men be discontinued owing to the difficulty in proving claims, and for the further reason that the experience of the companies seems to be that it would pay them to be self-insurers.

Standardization of Insurance Forms

The attention of the insurance committee has been directed to the liability on the part of a traction line receiving merchandise to be forwarded, which merchandise before it reaches its destination passes over the tracks of other companies; also liability in the case of shipments of merchandise that may be interstate. As the matter stands at present many interurban companies might suffer a severe loss, believing that they are fully protected.

The insurance committee has, therefore, thought it advisable to suggest that the member companies doing business in the Middle West states, as well as those engaged in interstate business, examine their policies and if there is any uncertainty as to the liability thereunder, they amend their forms by adding to the rolling stock item the following words:

"... all while in the barns or yards or on the tracks of the assured or of others, wherever they may be in the United States and/or Canada."

Should the traction company be carrying common carrier liability insurance, the wording on its form should be made to read as follows:

"\$.... on contents of cars for which the assured have assumed liability under bills of lading or shipping receipts or other agreements wherever the car or cars may be in the United States and/or Canada."

The report was signed by Williston Fish, H. A. Nicholl, Edward M. Wilson, Granville H. Bourne, N. H. Daniels, John H. Moran, Paul E. Wilson, Charles B. Scott, C. E. Morgan and John T. Staub, chairman.

C. E. Morgan, Brooklyn, presented the report of the committee on organization of community sections. This follows in abstract.

Organization of Community Sections

The general plan suggested to the committee was to the effect that a community section would consist of individual members of the association living in the same community or within a certain radius, who would affiliate for a mutual study of their local problems and would hold periodic and frequent meetings for this purpose. Special attention to be given to avoid any possible conflict with existing company section membership or other state associations.

The proposed membership would be much broader than any existing company section of the A. E. R. A., providing for not only electric railway employees but also for others interested in the industry, such as engineers connected with commissions, manufacturers supply dealers, students, college professors, consulting engineers, etc.

The committee feels that much good can be accomplished by the formation of such community sections, furnishing, as it does, an opportunity for those interested in the industry to get together at frequent intervals to discuss their common problems. It would give an excellent opportunity to bring together engineers and operating officials as well as the members of regulatory bodies, manufacturers, supply dealers, and in fact all those interested, from whatever angle, in the electric railway transportation field.

After careful study the committee is of the unanimous opinion that such community sections would be extremely beneficial in many ways to the industry and that the association would materially profit by the added membership.

The committee reported its findings with recommendations to the executive committee of the A. E. R. A., along with the proposed changes in the constitution and by-laws. The general plan of establishing such community sections was approved.

The necessary changes to the constitution and by-laws of the American Electric Railway Association are appended to the report.

The report was signed by James P. Barnes, F. R. Coates, C. R. Ellicott, W. H. Sawyer, Martin Schreiber and C. E. Morgan, chairman.

Company Section and Individual Membership

Martin Schreiber, Camden, N. J., reported for the committee on company section and individual members which appears below in abstract. Mr. Schreiber expressed his indorsement of the idea of having community sections and stated that it opened an opportunity to increase the individual membership to 25,000 or more, which was the goal originally in mind when individual memberships were first established.

During the year one large company section has been added to the list of

company sections, and none has dropped out.

The new section, No. 14, was organized by employees of the Chicago, North Shore & Milwaukee Railroad. At the time this report was written, the membership was 173.

The company section group comprises the largest group of members in the American Electric Railway Association. As this report is written, the membership of the combined company sections is approximately 1,800. They comprise the cream of the operating forces of the member companies that have established company sections. From these men the companies draw their future supervisory employees. In the opinion of the committee, all companies should assist in the organization of company sections, not only for the good of the men, but also for the good of the company.

The company section meetings afford an opportunity for the exchange of ideas, the development of social contact that makes for good feeling and greater efficiency and provide the men with information about their company that always is immensely valuable when the men are called on to meet criticism or complaints about service.

Year after year the committee on company sections has urged members of this association to organize sections, and believes that executives should take this advice to heart.

Reports from several of the sections, showing the scope of their activities, were appended. Work of two of the sections has been disrupted of late, so reports were not received from them.

The report was signed by C. P. Billings, F. G. Buffe, F. R. Coates, W. J. Flickinger, J. H. Mallon, W. G. Murrin, A. T. Perkins, Harry Reid and Martin Schreiber, chairman.

L. H. Palmer, Baltimore, presented the report of the committee on mail pay, which follows in abstract.

Mail Pay

The committee has carried on the work of preparing the presentation of the case for increased mail revenue before the Interstate Commerce Commission, and the hearing is set for Oct. 15. The reports that were requested of member companies in April, 1922, have been received in part up to August, 1923. On account of this long time the Post Office Department has requested a short delay in order to include these with the tabulation to be referred to before the commission.

The Post Office Department has co-operated in working out the details, and a large portion of the data will be in the form of an agreed joint exhibit, the facts of which are accepted by both sides. This co-operation of the Post Office Department has much simplified the case, and the committee can see no reason why an opinion should not be handed down by the commission at a relatively early date.

The committee regrets the delay in bringing this case to a hearing before

the Interstate Commerce Commission. It is due almost entirely to the failure of member companies to furnish promptly the information called for. A number of companies, including several which had authorized the committee to represent them, failed to furnish any information whatever, and after waiting for a long time the Post Office Department finally consented to a hearing with the partial information that was on hand.

The committee states in conclusion that the calculations to date indicate that it can prove that the industry is entitled to a substantial increase in mail pay rates.

The committee report was signed by C. L. S. Tingley, G. K. Jeffries, Samuel Riddle, W. S. Rodger, R. A. Leussler, Gordon Campbell, H. B. Weatherwax, R. P. Stevens and L. H. Palmer, chairman.

W. H. Sawyer, East St. Louis, presented the report of the committee on memberships, company and associate, which follows in abstract.

Company and Associate Membership

Since Oct. 31, 1922, the following gain in membership of the association has been made.

	Oct. 31, 1922	Oct. 8, 1923	Gain
Company Railways	348	339	9*
Associates	15	18	3
Manufacturers	244	289	45
Total	607	646	39
*Loss.			

As the total company membership of the association on Oct. 31, 1922, was 607, we show a gain in new companies of approximately 10 per cent.

During the year certain companies resigned their membership or were dropped from the rolls in accordance with the provisions of the constitution, these numbering altogether forty companies, so there has been a net gain during the year of twenty-one companies.

An appendix attached to the report shows a tabular comparison of the membership this year and last year, also a list of the new company members.

PERMANENT CAMPAIGN

It is the recommendation of the committee that the permanent campaign for new members inaugurated last year be continued in the future, and the committee is convinced that much work lies ahead of the new committee in extending the work. The service of the association has become a real necessity to the industry, is essential to its welfare and progress as well as to that of every electric railway company in the country, all of which should be members and support the organization which is the national representative of industry. It is believed that if these facts can be brought home in a definite way to non-member companies they will readily affiliate with the association.

The report was signed by H. H. Adams, W. R. Alberger, A. C. Blinn, Luke C. Bradley, F. D. Burpee, T. C.

Cherry, Jilson J. Coleman, L. E. Gould, Edward M. Graham, A. L. Kempster, George R. Lyman, W. J. Lynch, J. C. McQuiston, H. H. Norris, R. T. Sullivan, E. M. Walker, E. P. Walker, E. A. West, E. F. Wickwire, J. H. Wilson and W. H. Sawyer, chairman.

After briefly reviewing this report, Mr. Sawyer addressed the meeting as follows:

Revisions of the printed report to bring it up to date show that we now have 339 railway member companies, eighteen associate companies and 289 manufacturing companies, or a total of 646 companies, which is thirty-nine companies more than we had a year ago.

In this campaign I have personally written practically every non-member railway company in the United States, and my own conclusion from the replies received is that a great number of the non-member companies are simply plain slackers, and if you don't like the word "slackers" I might compromise and call them "spongers." They know that the American Electric Railway Association saved this industry and is making this industry better and bigger every day and that their company is profiting thereby. They know that the American Electric Railway Association spends time and money collecting data which are of vital interest to every electric railway in the country—that is, most of them do, for out of all the replies received there were only two companies which even by inference implied that the association was not doing good, efficient, constructive work.

Some of the companies are small companies who feel that they cannot afford even \$50 dues per year. Some of the companies are in receivers' hands, and feel that they must husband all their resources. Some of the companies are affiliated with other companies in such a way that all data and many other benefits of the association are accessible to them. Some companies do not even have a plausible excuse for being non-members.

There are, of course, non-member companies which we all agree have good reasons for not joining at the present time, but far too many of them put up a straw man excuse when the real reason is that they think they are saving money by not joining, and figure that although a national association is necessary and our association is doing good work, we will continue to do what should be done nationally and that they locally can wiggle along some way and pull through without the data, assistance and inspiration which come from efficient systematic co-operation. I have a feeling both of shame and of sorrow that there are still executives in the electric railway industry who do not realize that every one of us needs all the help and inspiration we can get—and there is no better, no more economical or efficient way to receive that needed help and inspiration than to join the American Electric Railway Association.

There is no possible question in my

mind but that the individual companies of this association receive direct and measurable benefits worth far more than their dues. My hope is that the committee this year has stirred up this situation enough, so that next year's committee may be able to benefit by the work which has been done this year, and which, I am frank to say, is not reflected in an increase of only thirty-nine members.

So far as the railway members are concerned, I have in my letters said little about their duty to the industry, but have dwelt upon the fact that sticks out to me so pertinently, that no railway company can in the final analysis really afford not to receive the benefits of this Association.

ATTITUDE OF THE MANUFACTURERS

Now, as to the manufacturing companies, my feeling is just this—we need their support and they need us. You can call it by any name you wish, but so far as I am concerned—and I am speaking only for myself and not the committee—a manufacturer has no right to expect to make money by selling his product to electric railway companies unless he as a manufacturer will do his fair share toward supporting the industry and this association which makes possible his sales to electric railway companies and makes possible his profits. Other things being equal, I have no desire to see business over which I have control go to a manufacturing company which is not doing its share to support our industry. So far as I am concerned, it is poor business for us to give business, other things being equal, to non-member manufacturing companies. From my standpoint, it is not fair or just when a member company pays dues to our association, comes here with its exhibits, shows and explain to us what the situation is in regard to its product, for us then to go back home and buy from a competitor who cares not for anything except the profit he may receive from the order—from a competitor who does not desire to co-operate or assist or help, but simply wants to take, and take all without giving.

We here believe in the American Electric Railway Association, and further I believe it is the duty of practically every railway company, and every manufacturing company which profits from the electric railway industry, to join the association, a duty not alone to the industry but a duty to itself.

Next year's membership committee will work hard; it will not be derelict—such committees have not been and will not be derelict—but the new members that are added to this association must come from the inspiration given by the present member companies to those now outside of the fold. Each and every member of this association should, out of a desire to help himself and to help his fellow man, consider himself as a committee of one to see that all the interests of the American electric railway industry co-operate and achieve success together.

W. H. Sawyer was again called to the platform, this time to give the report of the committee on co-operation with state and sectional associations. An abstract of Mr. Sawyer's remarks follows:

State and Sectional Associations

The first state committee on public utility information was organized in Illinois about five years ago, and it is due to the wonderful success achieved by this Illinois committee and the co-operation to others given by this committee that there are today more than a score of different committees operating in thirty-seven different states.

Primarily, the purpose of the committee is to give the facts about public utilities to the public through every available legitimate source. They disseminate information through newspapers, state public utility commissions, banking houses, public schools, and colleges, chambers of commerce, boards of trade, Kiwanis and Rotary Clubs, and similar organizations; all of them render on request special information service to individuals or societies.

Some of the committees have speakers' bureaus, and supply speakers for meetings, and all of the directors of committees maintain close personal relations with the leading editors of their respective territory. The contact between these committees and the advertising section of our own association is very close, and is within reason properly co-ordinated so that there is little or no overlapping in the efforts of the two organizations.

Practically every state committee on public utility information is healthy, functioning within reason properly, and without question doing a world of good. There are only some few of these committees which are not fully taking advantage of their opportunity, and are therefore not accomplishing the good which it would be so easy for them to do if they were given proper support by the public utility executives of their state.

My own personal experience has been that for every minute I have given to the Illinois committee on Public Utility Information, for every dollar which our company has contributed, I personally have been repaid many fold by the inspiration given me.

These committees have accomplished wonderful results, but it is not so wonderful after all when we stop and appreciate what a virgin field they had to operate in. We public utility men have been going along for a generation or so efficiently conducting our business but not taking the public into our confidence—not telling them what we had done, what we were doing, or what we were trying to do, and these committees started out to do just what some one should have been doing all the time. Better public relations is the most important question with which the public utility executive of today has to deal—the most important, barring none, for

better public relations are necessary to any satisfactory solution of our problems.

Some of you have not been doing your full duty to yourself, to your company or to your industry, but in spite of that these committees have done most excellent work. The results are outstanding; we need no statistics to prove conclusively that these committees on public utility information are doing wonderful work; but they have yet an enormous task before them. We have only scratched the virgin soil and are in a position where we cannot now for one moment afford to lessen our efforts.

These committees have set a precedent and it is going to require greater effort to live up to the precedent already set and to continue the march of progress. To falter now would be disastrous, far better to have never started. Therefore, I beg of you, do not get the idea that just because these committees have done such good and wonderful work that any of us can afford to allow a slackening up. We must all put our shoulders to the wheel and give them more support than we ever gave them.

Edwin C. Faber, in the absence of the chairman, L. S. Storrs, presented the report of the committee on publications, which was most complimentary of the great improvement made in the magazine *Aera* during the past year.

E. F. Wickwire, secretary Ohio Brass Company, Mansfield Ohio, reported in his inimitable and humorous way on the work of the committee on co-operation of manufacturers. This follows in abstract.

Co-operation of Manufacturers

An article in *Aera* for August described the work of the committee up to the middle of July, so it will be necessary only to mention the high points of things done this year and to say a few words about developments since the article referred to has been printed.

We have continued the publication of *Truth*, which contains items about electric railways suitable for posting on bulletin boards, or to be used in house organs and local newspapers. We have issued a little sticker which goes on the letterheads and order blanks used by the purchasing departments of our manufacturing members. It is just an entering wedge, but we are going to evolve further means of enlisting the interest and support of the many concerns who furnish raw materials and supplies to our member companies. The sticker reads:

"You have a dollars and cents interest in the welfare of the electric railways because a large share of the material we buy from you becomes a part of products which are sold to traction companies. Therefore, help them to get fair fares—reasonable regulation—an even chance for success."

It will reach many thousands of companies which have not realized their "dollars and cents" interest in the electric railway industry, and it is bound

to create a favorable impression in a field that we have scarcely touched heretofore. This is just another application of the good old motto that "the constant dripping of water wears away the hardest stone."

In August *Aera* an honor roll was printed which carried the names of about seventy manufacturers who were participating in the work. Following an intensive mail canvass of manufacturers, there are now more than a hundred co-operating companies on the roster. The same article outlined an idea for a poster campaign. This campaign has now been launched and shows signs of being the best result getter which this committee has been able to devise.

The opening broadside was fired on Sept. 20, when Poster No. 1 appeared all over the country in street cars, in waiting rooms and on factory bulletin boards. Never has such a response come in for any material which has been offered by the association. The original printing order was increased again and again, and many companies pledged their whole-hearted support. Not a dissenting note in any of them.

This poster was followed Oct. 1 by Poster No. 2, which depicted "600 pounds of conductors," and these men, multiplied several thousand times, threw their weight into the fight for the industry on that date. This poster idea is a practicable and forcible way of reaching the people, although to some it may seem almost too simple. But we must remember that we are trying to appeal to the intelligence of the masses. The good old adage about "aiming high" is all right, but in this case we had better "aim lower" if we want to hit the mark that we're trying for.

The committee feels that the overwhelming response to the poster series is a good indication that the psychology of the plan is sound and that it will go far toward accomplishing our purpose, if it is supported throughout the land—and it's up to every one of us to see that this is done.

This is a method of reasoning with the public, instead of arguing with them. We in the manufacturing business realize that usually if we win an argument with a railway man we lose the order. Let's profit by that little trait of human nature in the matter of our industry's relations with the public and not try to win our case by arguing.

We know that the electric railway has been hampered by adverse public opinion. Many men will actually inconvenience themselves if they think it will injure the electric railway. Some politicians and newspapers have been radical in their attitude toward the electric railway industry, and against everything that the industry has tried to do. Isn't this antagonistic attitude on the part of so many people largely due to a misunderstanding of our industry?

We have evidence which indicates

that the average man carries around a mental picture of Mr. Electric Railway which inspires anything but friendliness. We asked an artist to paint his conception of Mr. Electric Railway. He produced a portrait of a pudgy individual with a fat tummy, a silk hat and dollar signs all over his anatomy. Do you wonder that people are unfriendly if they are carrying around some such mental picture as that of Mr. Electric Railway?

Contrast that conception with the same artist's idea of Mr. Bus Man. This time he sees a friendly, sociable fellow, who may live next door or upstairs or around the block, and a man who has overdue bills and troubles and babies, just like he has himself.

Why doesn't the public recognize that our industry is essentially an industry in overalls? Why don't the people realize that the group of men which receives the largest slice of the money collected by traction companies is made up of the armies of workmen, who build and maintain the track, rolling stock and lines, who make the juice and run the cars—plus the legion of factory employees who make materials for the electric railway industry. Let's get the picture of the friendly man with overalls into the minds of the people and we will find a much different feeling on the streets and at the polls. We believe that it is possible to get that idea across if we combine our efforts in this movement and make them continuous. The public is busy these days and it's hard to make a lasting impression.

It is the nation-wide scope of this campaign that is going to get the results we are after—the adoption of the same tactics that are successfully used to sell tires, chewing gum and cigarettes. Your committee wants to emphasize the idea that the use of these posters must not only be widespread, but it must be sustained.

Favorable statistics will follow favorable public opinion as surely as the tail pursues the dog. The experiences of such cities as Des Moines, Iowa, and Saginaw, Mich., are convincing people that the electric car is an essential form of transportation in a wideawake city and that buses may have their place, but it is not in the place of the trolley car. Improved facilities of the interurbans, particularly in the direction of increased speed, safety and comfort, will not only enable them successfully to compete with the steam roads but gradually to eliminate inferior bus competition. There is more ahead of the electric car today than a safety fender.

Enough progress has been made by the committee to show that the work is valuable and that it warrants a place as a definite part of association activities and a larger organization to carry on the movement. In fact, the surface has scarcely been scratched. Just imagine the results which can be obtained when the full strength of the industry is mobilized and subject to call for instant action. Think of the

effect of having the ranks of the railways and the manufacturers organized into a legion which would present a solid front, lined up to fight against unfavorable legislation. The committee hopes to accomplish these things. We have been organized less than two years now, but feel that a real start has been made toward our objective.

The report was signed by R. E. Adreon, George O. A. Barnes, W. D. Blatz, C. R. Ellicott, E. C. Faber, J. C. McQuiston, E. B. Meissner, George R. Rowland, P. L. Thompson, E. P. Waller and E. F. Wickwire, chairman.

Edward Dana, Boston, briefly abstracted the report of the committee on education as follows:

Education

The outstanding feature of the year's work of the committee on education, as covered in its report, was the securing of definite co-operation on the part of a large number of member companies. This took the form of the appointment by seventy-six companies of representatives charged with the responsibility for studying local educational needs, co-operating with the committee on education and putting into operation such plans as prove practical. It was decided early in the year to confine attention to the following five lines of effort: (1) An explanation to executives of member companies of just what the committee aimed to do. (2) An appeal for the appointment of an official or a committee to take up local work earnestly in co-operation with the committee on education. (3) Provision for the delivery of the message of the committee on education to various sections of the association. (4) Getting into direct contact with the educational work being carried on in the industry now. (5) Consideration of the advisability of the association delegating one man to supervise and correlate the educational work of the committee.

For the convenience of member companies, the committee divided the educational problem into the following three component parts: (1) Educating present non-technically trained employees for supervisory positions. (2) Training trade apprentices. (3) Co-operating with technical schools to assure a supply of technically trained recruits.

As to practical things which can be done the following were listed: (a) Participation in co-operative courses with the universities and colleges. (b) Co-operation with high schools and trade schools in either day or night courses. (c) Co-operation between electric railways and large manufacturing industries, including exchange of employees. (d) Conducting classes on the university extension plan. (e) Arranging for periodic staff meetings and series of lectures and instructions on local properties. (f) Providing company section and other educational lectures and discussions on company properties. (g) Provision of shop and departmental apprentice courses. (h)

Distribution of company and association literature of an educational nature. (i) Americanization work for the benefit of foreign-born employees. Substantial progress, the committee stated, is being made along these lines in several states.

The committee interested itself in securing the publication of articles relating to employee training and appended a bibliography to its report. Attention was also drawn to a suggested outline of two courses which have been prepared as a result of a conference held at the eighth annual engineering extension convention of the Pennsylvania State College during May, 1923, on the subject of educational courses for public utility employees. In view of the fact that there is an association of the institutions conducting extension courses, it should be possible for such courses as are now being tentatively developed at the Pennsylvania State College to be made available for railway employees in practically any state in the Union. The courses referred to comprise a general one, intended to teach employees the economic conditions under which their companies operate, and a trainmen's course, dealing with shop practice, maintenance, apparatus, testing, supervision, etc.

The committee expressed itself as optimistic over the progress which has been made to date and confident that the importance of educational work has now become appreciated, so that permanent results must come, slowly, to be sure, but in a substantial manner. All member companies, large and small, were urged to appoint representatives to work up educational programs, to analyze last year's report and actively to become associated through the educational committee with the carrying on of this work.

The report was signed by E. J. Blair, Thomas Conway, Jr., C. B. Fairchild, M. B. Lambert, M. McCants, H. H. Norris, A. F. Perkins, F. R. Phillips, T. P. Pulliam, J. V. Sullivan, W. Von Phul, H. E. Weeks, T. S. Wheelwright and Edward Dana, chairman.

Henry C. Spurr, editor *Public Utility Reports*, addressed the association on various aspects of the utility situation. An abstract of his paper appears elsewhere in this issue.

President Emmons, as chairman of the Charles A. Coffin Prize Committee, then read the committee's report announcing the award of the prize. The report, comments of the President and the response of the recipients appears in the front part of this issue.

RELATION OF MANAGEMENT TO EMPLOYEES

The last feature of the program of the American Association consisted of two addresses on the subject "Relation of Management to Employees." The first of these was by Dr. C. A. Lippincott of the Studebaker Corporation, South Bend, Ind., who has devoted a great deal of attention to employee re-

lations and has shown real accomplishment in that respect with the 200,000 Studebaker employees. An abstract of his address is presented elsewhere in this issue. The second address was by Elisha Lee, vice-president Pennsylvania Railroad System. Mr. Lee gave a pointed discussion on the principles of management-employee relations on the Pennsylvania System and told of the progress there. His address is also presented in abstract elsewhere in this issue.

The committee on resolutions submitted a report expressing the thanks of the association to the public utility commissioners and other speakers, referring particularly to its pleasure "at the cordial support and co-operation expressed in the addresses by the representatives of the automotive interests" and hoping that this "is indicative of even closer relations in the future"; to the convention committees which prepared reports for the convention; to the committees in charge of the convention itself, including the exhibit director; to the exhibitors themselves for their wonderful record-breaking display; to the pier contractors and others in Atlantic City who had been especially helpful, and to the president and other officers of the association for their services during the year to the association "and through it to the entire railway industry." The report was signed by J. G. Barry, H. W. Blake and A. W. Brady, chairman.

A committee consisting of General George H. Harries, chairman; Charles L. Henry and Robert I. Todd then escorted the new president and four vice-presidents to the platform, where they were presented to the association by the retiring president, C. D. Emmons. In accepting the gavel symbolic of his presidency President Budd said he did so with a full sense of the responsibility and at the same time with full hopes of seeing the association and the industry continue in improvement of service and success. With the record of courage and accomplishment, in the face of almost every imaginable difficulty, which the railways showed during the war, with the stable position they have now regained in spite of many handicaps, the industry may be sure, said President Budd, that there can be no future difficulty it will not conquer. The four vice-presidents also made short talks, pledging their best efforts to make the coming administration a success.

The convention then adjourned *sine die*.

Exhibits More Numerous than Ever Before

NOT only in quantity but also in quality the manufacturers' exhibits excelled those of previous years. There were 167 individual exhibits, occupying 75,556 sq. ft. of space on the Pier and 374 sq. ft. outside. An interesting feature was the amount of space occupied by various motor bus manufacturers. A touch of humor was added by

the presence of original Toonerville Trolley, used in the making of moving pictures of the well-known cartoons of Fontaine Fox. In that connection it was noticeable that a number of exhibitors, who were prevented by the nature of their products from displaying them on the Pier, used moving pictures to show those interested the working of the apparatus. The manufacturers showed much originality in their displays and arranged the equipment in a very attractive manner. There was also a pleasing harmony in the decorations.

Committee on Welded Rail Joints Meets

THE morning of Wednesday, Oct. 10, was occupied by the committee on welded rail joints with a meeting held on the convention pier at Atlantic City. Fifty or more engineers were in attendance and the meeting was characterized by a spirit of practical earnestness. Dr. G. K. Burgess, director of the United States Bureau of Standards, presided, and W. W. Spraragen, secretary of the committee, assisted him.

After the reading of the minutes of the last meeting, Dr. Burgess called for reports of progress being made in the laboratories where joint tests are already under way. Encouraging reports were made on the tensile, bend, drop and impact tests. A number of joints have already been tested and an exhibit of several broken joints was made during the Atlantic City meeting.

Members of the committee were then called upon to report the results of their analyses of test data for different types of joints and valuable information was

given on the following: Carbon arc, electric seam; metallic arc, electric seam; thermit; cast weld; electric bar and electric butt. This work is not far enough along as yet to warrant publication of details.

Dr. Burgess then addressed the meeting on a program of future research work. He showed that great results are expected from the committee's activities, in which the Bureau of Standards is actively co-operating.

A report on the impact testing machine was presented. This machine is now due at the United States Bureau of Standards, where a small building has been erected to accommodate it. Prof. H. L. Whittemore exhibited a proposed design for the foundation of this machine, which was approved. It consists of a massive block of cast iron mounted on coiled steel springs. The joint to be tested will rest on pillow blocks, to which they will be attached by some method not yet determined. The top of the machine is curved to the radius of a car wheel and the machine is designed to duplicate as far as possible the conditions of service. At the same time all uncontrollable variables have been removed.

W. W. Wysor reported on the rotary service testing machine, the design for which is now practically complete. Details of the foundation for this machine were discussed. Estimates have been received of the cost of constructing the machine, and presumably the work will go forward promptly.

The secretary explained to the committee the financial situation, mentioning the expenditures to date and the new appropriations which have been made. He touched upon the work of his office and also some details of the several tests.

Manufacturers Move to Participate in Association's Advertising Campaign

THE manufacturer members of the American Electric Railway Association held a short meeting at 2:30 p.m. on Thursday. There were twenty-four present. E. F. Wickwire explained the ideas behind the movement of the manufacturers to participate in the association's advertising campaign to sell the electric railways to the public, so to speak. He explained that the whole idea was to drive home the thought that the man on the street and the electric railway operator, whether he be the trainman, a man in the shop or an official, were brothers.

In displaying some of the association's posters Mr. Wickwire explained the thought behind them. The campaign was a straight bid for support. There was no propaganda behind it. Mr. Average Man should be educated to a frame of mind where he will be reasonable in his attitude.

The public often had little grievances. These should be offset by popular publicity.

Mr. Wickwire said that so far as the

co-operating manufacturers were concerned it did not make any difference to the association who handled the matter, but that it was difficult to separate sales and publicity. In some cases the publicity man was in closer touch with the problem than was the salesman, while in other cases the reverse of this was true.

Mr. Wickwire further said that the new officers of the association would probably arrange to have a program for the manufacturers embodied in next year's meeting. These sessions would be open, with free discussion. The manufacturers have been away from the association idea for a long time now, but Mr. Wickwire did not think that it would be difficult for them to get back quickly to closer association among themselves. In the case of a campaign for publicity such as he had been discussing Mr. Wickwire said it would then be possible for the manufacturers who attend the meeting to carry back the message to their own publicity, advertising or sales forces.

T. & T. Association Proceedings

Traffic Regulation, Merchandising Transportation, One-Man Cars and Bus Operation Are Among the Leading Topics—Accident Prevention Was the Topic of a Joint Session with the Claims Association

THE first session of the Transportation & Traffic Association was opened by the address of the president, Garrett T. Seely.

President Seely's Address

Careful study of what constitute the most pertinent transportation and traffic problems of the industry was given by your executive and subjects committees with the result that the subjects assigned to this year's committees are all of vital importance.

Traffic congestion in the business streets of all cities is becoming increasingly serious each year. The solution of the problem can be worked out only through the co-operation of state and city authorities with civic organizations and transportation agencies. The importance of relief from existing conditions, as well as the prevention of still more serious congestion, made manifest in the committee report that will come before you, warrants more detailed study of remedial measures by a committee in the coming year.

The problem of making the services of the street and interurban railways more attractive to our customers will be presented forcefully in the report of the committee on merchandising transportation. This report will contain much of interest to all of us, the committee developing its study along five main lines of thought.

The use of the weekly pass, or the form of quantity-ride selling, has been extended during the year in an effort by various companies to increase riding through a change from the old stereotyped cash and ticket fare. The importance of the committee's study of this phase of the problem of merchandising is reflected in the fact that where only one company used such a method in 1919, there are in 1923 thirty-five companies which either have it now in effect or have had it in effect.

An especially interesting phase of this same report is the chapter devoted to car design from the standpoint of merchandising transportation. The tendency in the design of cars, as gathered from replies to a questionnaire sent out by the committee, is toward more comfort for passengers, easier entrance and egress, more comfortable seating, better lighting and the like, lower floors with fewer steps, more attractive cars, both as to exteriors and interiors, and the elimination of signs, even sometimes of advertising.

Merchandising by advertising, utilizing employees for selling and other phases of the development of passenger,

Garrett T. Seely
Retiring President

freight and express business are ably considered. The value of the committee studies in the last several years of this phase of the transportation business is apparent, and this subject is one which may well warrant still further attention in the year that lies before us.

The use of the one-man car in city operation has become standardized. Its advantages are thoroughly recognized. There are many suburban and interurban routes as well that are adapted to one-man operation, and the field for this method is extending from year to year. Through scientific car design a type of car is developing which fulfills service requirements, is comfortable and attractive, and, through its light weight, lower platform expense and reduced power and maintenance costs, brings the total costs of furnishing attractive and adequate service down to, or within striking distance of, the irreducible minimum.

The past year has seen sufficient development of the use of buses by electric railway companies as auxiliary

J. K. Punderford
President-Elect

to their car service to yield for the first time for the study of your committee definite facts of costs and operating conditions. The report of this committee will merit your closest attention, developing carefully and concisely as it does the study of the classes of bus service operated, the reasons for the inauguration of the bus service, the type of equipment used, operating and maintenance methods, rates, transfer arrangements and accounting methods, as well as the operating results and the effect of operation on public relations.

This phase of transportation has attracted such wide attention from the public that it is one which must command the careful consideration of every transportation man in the coming year, undoubtedly being a subject that will well repay further earnest study by a committee of this association.

Finally, we have the ever-important subject of accident prevention, which will be presented in a report resulting from a joint study of the causes of accidents by committees of the Claims Association and this association. This study brings consideration of this all-important topic to a still higher plane in the continuation of the excellent committee work of former years.

Every one of these reports should be fully discussed from the floor of this convention. The committee work is the mainspring of association progress. Ours has been a rapidly developing industry and it is chiefly through the work of the committees that this development has been guided. It is highly desirable therefore that any of us who may be able from our experience to add to the sum of information brought out in these reports should do so. I sincerely hope that none will hesitate, or await urging, to "speak out in meeting" and make the discussion of these vital matters complete and instructive.

Ours is the essential business of furnishing urban and interurban transportation. This association represents the phase of that business that has for its particular field the rendering of service and the selling of service to the people of our various communities. We must sell that service to a sufficient number and in such manner as to fulfill our quasi-public nature and at the same time to make our service remunerative as a business.

Report of Secretary

Because it consisted only in an abstract of the minutes of its meetings the report of the executive committee was not read. In the report of the

secretary, Mr. Welsh called attention to the fact that the committee personnel is widely distributed geographically, making each committee fairly representative of the industry. Although it is not possible on this account for some of the more distantly located members to attend meetings regularly, their assistance and co-operation was obtained through correspondence. He emphasized also the difficulty of obtaining answers from questionnaires, and asked for increased co-operation to get results by this means. The number of answers received during the past year was discouragingly small in proportion to the number of questionnaires sent out. A statement was made also of the gains and losses in the number of members of the association during the year and the need of building up the membership was emphasized.

On the committee on resolutions, the president appointed J. E. Wayne, vice-president and assistant general manager York Railways, York, Pa.; M. McCants, assistant general manager Market Street Railway, San Francisco; C. L. Van Auken, editor *Electric Traction*. The committee on nominations was composed of C. E. Morgan, vice-president and general manager Brooklyn City Railroad; L. H. Palmer, general manager United Railways & Electric Company, Baltimore, and James P. Barnes, president Louisville Railway, Louisville.

The report of the committee on traffic regulations was read by H. B. Flowers, president New Orleans Public Service.

Traffic Regulations

The committee on traffic regulations, at the one meeting held during the year, decided that the committee should reinvestigate traffic conditions throughout the country. The effect of parking especially should be noted, as well as steps taken by various municipalities to cope with it.

As the result of this study it has been found that congestion of traffic has increased everywhere. There is scarcely an incorporated village or hamlet that has not its traffic problem the same as the cities of the first class. In each case it is strictly a local problem, but the statement for each is the same, "How may we best utilize our streets, roads and highways to handle the constantly growing traffic which must use them?"

Street cars carry the bulk of passenger traffic. In fact, the average surface car line more than carries the population of the community which it serves daily. That fact should be recognized in all regulations affecting traffic in which street cars are a part.

We have passed through the time of the making of traffic regulations. Many of the rules necessary to the rapid and safe movement of traffic are now almost as universally applied, understood and obeyed as the rule of keeping to the right.

The many remedies for eliminating congestion have been or shortly

will be of like universal application. Semaphores, safety zones, abolition of left-hand turns, loading platforms, traffic lanes, each and every traffic-handling device, together with the making uniform of rules in connection with their use, have helped eliminate accidents, insure a more rapid transportation and a greater public convenience, but neither singly nor together have they been able to prevent traffic congestion.

The communities served by the electric car are not fully served if the traffic congestion in these communities makes impossible the safe operation of a rapid service, and while it may be sufficient answer to criticisms of the service to say that it is the best possible under traffic conditions, the committee feels that the industry might well aid in the elimination of that congestion.

It might well have its part in the education of the public. It might place its facilities as a national industry for the gathering of technical advice and practical experience at the disposal of the various communities which its members serve.

As individuals and good citizens the operators of this utility avail themselves of their membership in the association to place at the disposal of their communities such information as the association might have bearing on that particular community's problem.

As an example of the necessity for keeping in contact with traffic conditions throughout the country, the committee cited two experiments now under way in Detroit which, if successful, will be of great interest to the industry and especially to transportation men.

In Detroit an ordinance has been enacted compelling a full or boulevard stop by all vehicles before entering or crossing some fifteen main thoroughfares. The second experiment is the making of scheduled stops in blocks of three, which is perhaps the largest elimination of stops on purely local service heretofore attempted.

The reporting to the industry of the conditions which led to these two experiments in terms of traffic and the results obtained might, in the opinion of the committee, be of the same value to the operators of street cars as the fixing of a new standard in something purely mechanical.

The report was signed by Paul E. Wilson, H. O. Butler, W. H. Maltbie, F. R. Cogswell, Frank P. Edinger and H. B. Flowers, chairman.

Following the presentation of this report, George B. Anderson, manager of transportation Los Angeles Railway, spoke of the importance of educating the public along the lines mentioned in the report of the committee. The two chief objects of traffic regulation should be to safeguard life and to expedite movement, and all provisions in traffic ordinances which aim at objects other than these must be regarded as useless encumbrances.

Mr. Anderson emphasized the point that the great mass of street car riders

are unorganized and are therefore handicapped and at a disadvantage in securing the passage of such ordinances as are for their own interests. On the other hand, merchants, automobilists, and so forth are united in organizations of various sorts which are able to influence the passage of such ordinances as they desire. Railways should therefore pay particular attention to the education of the public to the end that they shall see that their own best interests are served by the inauguration of such traffic regulations as will benefit the railway.

Additional discussion of this subject was contributed by J. R. Bibbins, consulting engineer, Washington, D. C. He spoke of the rapid increase of population in our urban centers, and the even more rapid increase in the riding habit. Properly to handle the transportation problem in the face of these circumstances will require the most expert attention to traffic regulation.

Both Mr. Anderson and Mr. Bibbins brought out the point that the removal of street railway tracks is often advocated as one cure for the transportation situation. Mr. Anderson particularly emphasized the falsity of this idea by figures, which showed in Los Angeles that the automobile traffic on streets without railway tracks was only about 40 per cent greater than on those streets where tracks existed. The ultimate result that could be hoped for by the removal of the tracks, therefore, would be to increase the capacity somewhat less than 50 per cent. This would fall far short of being a real solution. Mr. Bibbins, too, said that this was not the answer, and suggested that the T. & T. Association was the logical means of bringing home to the public attention the falsity of such reasoning. With the facts before them people would be less ready to listen with any degree of patience to the appeal of the demagogue.

The report of the committee on merchandising transportation was presented by Samuel Riddle, vice-president Louisville Railway.

Merchandising Transportation

The report of the committee on merchandising transportation is divided into five general subjects: (1) Weekly passes, monthly nickel permits, commutation tickets; (2) merchandising by advertising; (3) utilizing employees for selling; (4) car development for merchandising; (5) developing passenger, freight and express business.

No space was used in the report to urge member companies to continue their efforts to merchandise transportation, as it was considered superfluous. The committee contented itself with studying what companies have actually tried out, and a summary of these studies was presented.

Weekly Passes, Monthly Permits, Commutation Tickets—The use of the weekly pass and the monthly permit was greatly extended during the year. Where one company tried these meth-

ods in 1919, one in 1920 and four in 1921, more than a score put the pass or permit into use during 1922, and in the first four months of 1923 six other companies had inaugurated the use of one or the other. On May 7, 1923, according to a compilation made by the American Electric Railway Association, there were thirty-five companies which were then using, or had used, the weekly pass.

A table presented in the report shows that the introduction of the weekly pass, with but three exceptions among the companies furnishing information, has been followed by a reduction in the average fare per passenger. A point upon which the committee endeavored to obtain information was whether or not the use of the pass or permit had increased riding and the effect it had had on revenue. Exact figures were impossible to obtain, but the general experience seemed to be that it had stimulated riding to some extent. With one exception, all the companies had used newspaper advertising extensively at the time the concession was made, and most of them continued this form of advertising intermittently. The favorite method of distributing the pass is to have it sold by the conductors on the cars. Approximately half of the companies also sell the passes and permits at their offices.

EXPERIENCE WITH WEEKLY PASS

Another pre-eminent advantage is that the pass and permit everywhere seem to have created a better sentiment toward the company making the experiment. In corroboration of this statement the following expressions of opinion received from member companies are quoted:

"The weekly pass speeds up operation, avoids arguments over fares, stimulates riding in non-rush hours, reduces work for trainmen and creates a friendlier feeling."

"The weekly pass has eliminated jitney competition and made the company more popular."

"The advantages for us have been good will and no request for a lower fare."

"We think we have received the good will and co-operation of the public by the reduction in fare made possible."

"The advantages are an increase in non-rush hour riding, an increase in the riding habit, and the fact that it does not necessitate additional service, creates good will and gets a dollar from a man who otherwise would pay less."

"In times past the persons who used our cars most frequently had the most complaints to make about our service, such patrons seeming to feel that their heavy outlay for fare gave them a better right to kick. The weekly pass has made this class of patrons our firm friends, and even a hostile mayor is not able to get a rise from the public in response to his denunciation of us."

Merchandising by Advertising—Merchandising transportation by the printed word is growing very rapidly in the electric railway industry. The number of companies advertising, in one form or other, is now, according to

the report of the committee, approximately 300, whereas three years ago not one-tenth of this number were using advertising. More, however, should be advertising.

In studying the advertising that electric railway companies are now doing, it was found that there are four mediums being utilized to varying degrees. These are newspapers, display cards inside the cars and car-window posters, display cards or dash signs outside the cars, and weekly, semi-monthly or monthly publications in pamphlet form, to be placed in racks or holders inside the cars.

The use of display signs inside the cars has been found very effective in bringing to the attention of passengers matters of policy, measures of safety and details of operation practices. All this tends to create a psychological reaction in favor of the railway.

Many companies utilize window signs for good will advertising. This space is the most preferred of all positions, because it is possible, by printing the signs on both sides, to reach not only the car rider but persons outside the car who are walking or riding in other vehicles. This space is always available to companies, without cost, for it is never included in contracts with car-advertising companies.

The committee expressed the belief that no more valuable means of stimulating travel exists than by the use of properly worded and attractive dash signs. These may be utilized to give publicity to every legitimate form of amusement, public and church gatherings and special events.

Many electric railway companies are now providing weekly publications for car riders in "Take One" boxes. It is advisable for such publications to be in small pamphlet form, and they should carry an amusement directory of the theater attractions of the city. Experience indicates that they should not be filled with company propaganda.

Utilizing Employees for Selling—

"The handling of the car by the motorman and the treatment of the passengers by the conductor play a most important part in so satisfying patrons as to develop future business." The truth of the foregoing statement is so well established that it requires no further exposition. The real crux of the problem, however, is the manner in which motormen and conductors can be trained to be efficient, courteous, neat and generally pleasing to the patrons with whom they have to deal. The biggest obstacle to be overcome is the fact that the ordinary platform worker does not himself know what his company's problems are. One southern railway has done much to gain the good will of its public by means of the appointment of a committee of nine trainmen to study the merchandising of service. The committee suggests that many members of the association, by following in the footsteps of this southern railway, may improve the manner in which they are utilizing their employees for selling.

Considered purely from the angle of the effect that the platform man has on selling transportation, however, the

committee believes that there are four qualities every good conductor should possess, and that there are three that every good motorman should have. These, it is believed, railways have a right to demand of their employees, and, what is more important, a chance of obtaining to varying degrees. These qualities for a conductor are good nature, personal neatness, general knowledge of the streets and buildings in his city and intensive knowledge of the part of the city through which his own line operates, and a good voice. For the motorman, the first two qualities are the same and the third is ability to start, operate and stop his car smoothly and easily.

The committee believes that the knowledge of what to do is not sufficient without the desire to do it, nor is the desire sufficient without the knowledge of what to do. The report outlines a list of eighteen possible cases where friction was likely to occur between the trainmen and the public, and suggests, in a general way, the best method of handling each case. Platform men should be impressed with the fact that the passenger is always right. Controversies arise in actual practice more frequently over transfers than over any other one thing. If the conductor and the passenger both are persistent, one of two things happens. The passenger either pays another fare or is put off the car. In either case, the company has not only made an enemy of the person affected but, because of some peculiarity in human nature, is certain to have alienated the sympathy of the majority of those who heard the controversy. It is better for the conductor to listen to the passenger courteously and then, even though the passenger is wrong, politely to drop the argument.

Car Design from the Standpoint of Merchandising Transportation—The report describes several pronounced tendencies in the design of new cars. There is a tendency to greater comfort, with easier entrance and egress, more comfortable seats of greater length and width, with a better type of upholstering, greater distance between seats, armrests, better lighting, low floor levels requiring few steps to the car floor, ramps rather than steps between platforms, better windows, with plate glass in some cases, and a free, open outlook from all sides, more pleasing interiors and exteriors, and the elimination of signs, often the elimination of advertising as well.

Another general tendency is toward lighter weight for economy. This, fortunately, fits in well with the tendency for comfort, as a low-level floor allows of a lighter truck and less swaying from side to side. The lighter truck also allows the use of lighter motors and simpler control. This all, in turn, makes possible faster acceleration and braking, which then makes possible the maintenance of scheduled speeds with lower, free-running speeds, a desirable situation from many standpoints.

Features of the most recent cars of a number of railways are described in some detail. The results of a number

of questions sent out to member companies are also presented. One of the most interesting is the indication that the standard Birney safety car does not meet with great favor, unless modified in certain respects. The principal feature is that double doors are required and the cars should be made more substantial.

There is a tendency to eliminate mandatory or "rule" signs altogether. In such cases the personal conduct of the passengers is left up to their inherent decency. Smoking in the rear of the car during the part of the year when the windows are all open may take place in such instances.

Another point made is that center lighting is very satisfactory when shades of the proper design are provided. The glare is less and the reflection on the motorman's window is less on open vestibule cars.

Developing Passenger, Freight and Express Business—In general, the answers to the committee's questionnaire on this subject were not satisfactory. No attempt was made to set forth the methods used on urban railways to stimulate passenger business. Only the methods of the interurban line are mentioned. The replies indicate that time-table folders are considered the best form of publicity. Other forms used are descriptive and lithographic circulars, newspapers, car cards, billboards and posters.

The main features in building up passenger traffic are fast, reliable service, good, well-painted cars kept clean and sanitary, a good roadbed, courteous crews on trains and agents that can give reliable information and prompt service.

The report was signed by H. H. Brown, G. Sabin Brush, Frank L. Butler, R. F. Carbutt, John F. Collins, John A. Dewhurst, Samuel W. Greenland, M. McCants, A. W. McLimont, Richard Meriwether, E. B. Moore, F. D. Norviel, O. A. Smith, T. H. Tutwiler, C. L. Van Auken and Samuel Riddle, chairman.

Discussion

S. W. Greenland, vice-president and general manager Indiana Service Corporation, outlined the study which was made of the weekly pass. Walter W. Jackson, consulting engineer, and W. H. Boyce, general manager Beaver Valley Traction Company, discussed this phase of the report. Mr. Jackson analyzed some of the reasons why the weekly pass after being installed has been retained on some properties and discarded on others. Several fundamental requirements were listed as being necessary to a successful pass installation. The community must be of a size to allow the encouragement of non-necessity riding; a sufficiently frequent service must be provided to build up more general short riding; the program for the installation of weekly passes should also include an improvement in the service; the pass must not be too high in price and it must be effectively and continuously advertised.

Several examples were given of instances where the pass was installed

and then abandoned, either because the property was so small or was in such condition that the pass could not save the situation. Failure to apply the proper kind of pass to meet a specific combination of conditions was also pointed out as a cause for the discontinuance of the weekly pass scheme on some properties.

Mr. Boyce discussed the results obtained with the pass on the Beaver Valley property and described the zone system in use. A progressive scheme of monthly "bargain" sales, in which the three-zone or "system" pass is sold at reduced rates, illustrates in a striking manner the application of general merchandising principles to the sale of transportation. A reduction in the price of the system pass from \$2 to \$1.50 doubled the sales of this pass in a very short time.

The work of the committee on merchandising by advertising was put before the association by Frank L. Butler, general operating manager, Georgia Railway & Power Company. The discussion of this phase of the subject emphasized the necessity for intelligently planned advertising. Contact with the public by frequent insertions was held to be important. The practice of having advertising copy prepared by the same department which handles complaints was recommended as a proper means of getting the correct viewpoint into the advertising copy. It was also held that copy written with a view to developing human interest stories maintains a proper contact with the public and gives the desired results. This same idea was brought out further in the discussion by the use of the expression, "The advertising should personalize the service."

In addition to reading excerpts from the portion of the report dealing with the utilization of employees for selling, M. McCants, general manager Market Street Railway, San Francisco, discussed the report. Mr. McCants took exception to the unequal use of the slogan, "The Passenger Is Always Right." He maintained that this policy may frequently lead to the adoption of the easiest way out of a controversy rather than the best way from the standpoint of dividends, as well as good will. Standardization of verbal expressions to be used by platform men in avoiding passenger disputes was held by Mr. McCants to be of considerable help in connection with this difficult matter. He emphasized the fact that the interest of the men must be aroused.

The difficulty in detecting the personal characteristics of new employees in the employment office was mentioned, and it was explained that proper training and management, by helping to keep satisfied employees, go a long way toward maintaining the good natured contact with the public which is so essential to proper merchandising.

In connection with the report of the subcommittee on development of car design for proper merchandising, John W. Dewhurst, railway engineer of the public utilities management department, Day & Zimmerman, Inc., gave a

brief abstract and added several comments on additional phases of the subject. He emphasized the importance of the elimination of noise in making the car ride more comfortable. H. H. Adams, superintendent of shop and equipment Chicago Surface Lines, stated that car design for proper merchandising involves an extremely broad and interesting subject. He discussed the importance of low steps and liberal platforms in facilitating passenger movement, and also described briefly the new automatic door which has been applied to one-man cars in Chicago. L. H. Palmer, general manager United Railways & Electric Company, Baltimore concurred in Mr. Adams' remarks and also indicated that proper lighting and heating are essential to the maintenance of passenger comfort.

W. G. Stuck, superintendent of equipment Kentucky Traction & Terminal Company, read a discussion on this phase of the report and also emphasized the importance of proper heating and lighting in making satisfied passengers. Comfortable seats, pleasing paint and finish, and proper arrangement for the movement of passengers, were additional factors that were discussed.

Many comments were made on the subject of building up freight and express business which was abstracted briefly by F. D. Norviel, general passenger and freight agent United Traction Company of Indiana. Mr. Norviel said that the key to building up freight business is proper service, and that although solicitation and advertising are necessary to accomplish this purpose, they must be backed up by real service to the shipper.

SCHEDULE SHOULD FIT TRAFFIC

E. H. Maggard, vice-president and general manager Petaluma & Santa Rosa Railroad, read a prepared discussion of this subject. He felt that service, personal solicitation and a good local agent are the three most important factors to be considered. In addition, the freight schedule must fit the different classes of merchandise offered for shipment. The adoption of appropriate slogans in advertising both through paid mediums and by signs on the cars and buildings of the property were held to be of considerable help in building up business. Proper terminals and facilities for handling bulky freight must be provided. Six years of experience in the application of these principles was given as the reason for the growth in freight business from 60,000 tons annually to 210,000 tons annually on the property.

This subject was further discussed by Victor S. Curtis, secretary and general traffic agent the Connecticut Company, and C. H. Hardesty, general traffic agent Monongahela Power & Railway Company, who described various practices which had been used on their respective properties for building up both passenger and freight business. Mr. Hardesty reported favorable results from the sale of party tickets at reduced rates for groups of ten or more passengers. T. J. Jay, freight traffic

manager Pacific Electric Railway, described the results obtained from the establishment of joint freight rates with connecting steam lines. A growth in freight business from \$1,000,000 an-

nually in 1913 to \$6,000,000 in 1923 was attributed largely to the effect of this arrangement in inducing industries to locate upon the line of the electric railway property.

Tuesday's Sessions T. & T.

The Tuesday afternoon session of the committee on transportation and traffic commenced with the report of the nominating committee, in which the following names were proposed:

President, J. K. Punderford, vice-president the Connecticut Company.

First vice-president, T. C. Cherry, president Auburn & Syracuse Electric Railroad.

Second vice-president, G. H. Clifford, vice-president Northern Texas Traction Company.

Third vice-president, J. V. Sullivan, assistant to the president Chicago Surface Lines.

Executive committee, Edward Dana, general superintendent Boston Elevated Railway; W. H. Boyce, general manager Beaver Valley Traction Company; E. M. Walker, president Schenectady Railway, and Samuel Riddle, vice-president Louisville Railway.

The nominations were then closed and the secretary cast a unanimous ballot for those named.

The report of the committee on one-man car operation was presented by J. P. Pope, general manager Kentucky Traction & Terminal Company.

One-Man Car Operation

In its report the committee states that its scope, as originally drafted, was to apply to suburban and interurban transportation only, but that since city and suburban transportation are so closely allied, wider latitude should be given to cover all branches of the railway industry.

The committee states that, on the whole, the operation of one-man cars differs but little from that of two-man cars. But few minor changes in the rules are necessary, most of which are necessitated by local conditions. The one-man operator has to do his own switching, has to collect and register the fares and has to handle train orders by himself.

For speeding up transportation on interurban systems, the committee states that fare register registration is the quickest and most feasible method of operation; in city transportation automatic transfer machines should be considered carefully.

As to the economics of the one-man car, the committee states that the savings may be considered under four heads—platform expenses, track costs and maintenance, power costs and accident costs.

The saving in platform expense is evident, even allowing for increased compensation.

Track costs depend on the use of light-weight cars. No attempt has been

made to compile information on track savings, as but few companies are operating such light-weight equipment in interurban service, and the operation has not been sufficiently extended to arrive at an analysis of the savings. Tie spacing can be increased materially. The light-cars will not crush the ties, thus increasing the life of the track structure. Less maintenance of the track will be needed, and the decrease in cost of this item should be very large if light-weight equipment is used exclusively.

Rebuilding of heavy two-man cars for one-man operation will result in no saving of power consumption, while with modern light-weight cars the saving will be very marked.

It is the opinion of the committee that the accidents occasioned with one-man cars are not in excess of, and probably are less than, those with two-man cars for the same mileage.

The committee states that the advantages of the one-man car are: Frequent service, maintaining reasonable rate of fare and safety. With regard to danger of railroad crossings, the belief is that greater safety results from having the responsibility of flagging railroad crossings placed upon the one-man operator, rather than having it divided.

It is recommended by the committee that a joint committee of the Transportation and Traffic and Engineering Associations be appointed to make a number of designs of a standard one-man car.

The report was signed by J. E. Duffy, W. E. Wood, A. Swartz, L. G. Van Ness, A. L. Reynolds, H. C. DeCamp, K. A. Simmon, N. W. Bolen, G. H. Clifford, T. C. Cherry and J. P. Pope, chairman.

In discussing this report, C. E. Morgan, vice-president and general manager Brooklyn City Railroad, spoke of the success of one-man operation in that city. It was found that the average trainman preferred to operate a car alone rather than to have an additional man to collect fares during the rush hour. On thirty-eight lines in Brooklyn where one-man cars are operated there has been necessary an addition to the running time in only two cases, although during the same period every two-man line has had to increase its running time. One-man cars operate on the same streets with cars of other types through the heaviest kind of traffic. Mr. Morgan disagreed with the report of the committee in so far as saving power is concerned and said that there was a very noticeable saving with converted one-man cars in Brooklyn.

J. B. Stewart, Jr., general super-

intendent Youngstown Municipal Railway, described the method by which large cars of various types have there been converted for one-man operation.

President Emmons of the American Association expressed his gratification at the great success of the convention and said that he thought it was in no small measure due to the interest displayed by the members of the various affiliated associations.

Continuing the discussion of one-man car operation, Mr. Riddle described an interesting method of numbering stations on his property. This was done for the sake of simplifying the arithmetical calculation necessary to compute the fare.

The report of the committee on bus operation was presented by W. J. Flickinger, assistant to the president of the Connecticut Company. Mr. Seely asked Mr. Punderford, sponsor for the committee, to preside during the presentation of the report. An abstract of the report follows:

Bus Operation

It is generally conceded that there is a place in the present transportation fabric where the motor bus can be used to advantage. Public authorities have gradually brought order out of the chaotic conditions which the competitive jitney introduced in the transportation field seven or eight years ago, and many communities have now accepted the motor bus as an auxiliary to existing transportation facilities. The electric railways are also becoming increasingly interested in its use in meeting the full requirements for transportation in the territory which they individually serve.

The report of the committee consists largely of a review of what is being accomplished by various member companies operating motor buses. Information is presented to show the class of service operated. This indicates that, of seventeen companies reporting, seven operate supplementary service, twelve feeder service and nine independent service. Looked at in another way, seven of the companies operate exclusively on city routes, four on suburban lines, two in interurban service, two in city and suburban service, one in city and interurban service and one in city, suburban and interurban service. The base operating schedule calls for 185 buses, while the peak requires 225 vehicles. On the average, each bus travels 134 miles per day, while the individual mileage reported varies from 70 to 216 miles.

An analysis of the reasons for inaugurating bus service indicates that all of the seventeen operating companies are quite closely following the principles laid down in the 1922 report of the committee. This means that if a railway company adopts the policy of providing all transportation needs in the territory served the possibilities of the bus as an aid to such policy cannot be overlooked. As for supplanting existing rail lines with bus routes, this

is a problem of economies, but it will be found that when rail lines with low earning power are faced with heavy rehabilitation or paving charges the bus can be used as a means of continuing service with an expenditure for equipment much below the cost of plant renewals or paving. A summary of the replies given as to the reason for bus operation shows that eleven undertook operation in order to hold a monopoly of transportation in the territory served, two companies have supplanted their rail lines with bus routes because traffic has failed to meet investment charges, two companies are using buses to provide a shorter and quicker route, one company operates buses to keep out competitors and, one has used buses to avoid excessive rehabilitation charges.

Types of Equipment.—The type of motor bus equipment used indicates the twenty-five-passenger bus to be the most favored, with the fourteen- and eighteen-passenger vehicle following in the order named. The type of chassis most commonly operated appears to be the White Model 5, which nine companies report using. Five companies have Reo and Republic, while four report Mack. Other types are not used by more than one company. Pneumatic tires are reported in thirty-one cases, and in nine cases duals are used on the rear wheels, while cushion or semi-pneumatic tires are used in only ten instances. Weights of buses per seat calculated from the table given in the report indicates as follows:

Passenger Capacity	Weight of Bus (Lb.)	Average Weight per Seat (Lb.)
13	4,950	380
14	3,000-7,200	215-514
16	4,350-5,500	272-344
18	4,500-9,000	250-500
19	8,430	444
20	6,000-7,920	300-395
21	7,000	333
24	6,480	270
25	8,130-10,000	325-400
27	6,100	226

Step heights on one-step buses vary from 14 to 20 in. from the ground to the tread of the first step with a riser of from 8 to 14 in. to the floor level. In case of a double step the second riser is 9 to 9½ in.

The committee in discussing design of vehicles says: "If we are going to sell to the public the idea that street railway companies should be given the opportunity to furnish the entire transportation service, the importance of having the proper equipment to provide the greatest amount of safety, comfort and convenience cannot be too strongly emphasized. It is pleasing to note that street railway companies are discarding the truck chassis and adopting the improved types as rapidly as the builders are developing them."

In the further development of the chassis, simplicity and accessibility should be the chief aim of automotive engineers. It should be borne in mind that ordinary running repairs are made without removing the body and, therefore, easy removal and replacement of parts from underneath the chassis

should be made possible. It is very desirable that time out of service be the minimum. A unit repair system will best meet this requirement.

Consideration must also be given to the peculiar requirements of a vehicle operated in passenger service such as low center of gravity, clutch and gear designs for frequent stopping and starting, adequate and economical power, and spring suspension to give maximum riding comfort under varying load conditions.

This report does not touch upon body development. Each company, it is believed, will work this out according to its own requirements. In general, there seems no reason why the electric car body designs cannot be used as a base from which to develop a body which will give public satisfaction from the standpoint of safety, comfort and convenience. There will, of course, always be cases which will require specific treatment based on the particular transportation problem to be solved.

Operating and Maintenance Methods.—Where buses are operated as feeders or in conjunction with the railway service in any manner, schedules should be so laid out and maintained as to correlate the service from both facilities. This result can be obtained with the best economy if the same supervisory organization is responsible for both.

However, where a route is operated independently of the street railway service, it may be found desirable to supervise it with a separate organization.

Most of the street railway companies operating buses are doing so on such a small scale as not to warrant the increase in overhead and maintenance costs necessary if the repairs were entirely divorced from the electric car work. The committee believes, however, that this practice ceases to yield maximum efficiency and economy the moment the number of units becomes large enough to keep a separate corps of mechanics, inspectors and cleaners busy during a full working day. Bus chassis maintenance requires an entirely different line of training than that of electric car maintenance and if an attempt is made to spread the supervision and maintenance over both types of equipment, the maintenance of both will be unsatisfactory.

The body maintenance presents an entirely different situation. Bus bodies are now very closely following the type of construction used in electric car bodies and this work can be more efficiently and economically done by augmenting the regular body maintenance force sufficiently to take care of the additional equipment.

Several of the companies which have gone quite extensively into bus operation have either laid plans for or constructed garage facilities separate from those of the railway shop.

Rates of Fare and Fare Collection.—A comprehensive table showing both

the railway and bus fare and the methods of collection is appended to the report. The majority of the companies are maintaining the same rate of fare on both the bus and the trolley car. Another tabulation shows that the cost of transporting a passenger by bus is greater than by trolley car, and the reasonableness of a higher rate of fare on the bus, particularly where the volume of traffic is so low that the railway will not produce sufficient volume of traffic to meet the cost of operation, or where the bus provides a more expeditious service than the trolley car.

Basis of Charging Depreciation.—None of the companies, by reason of short experience, is in a position to give definite information relative to the life of bus equipment. All of the depreciation is set up on a tentative basis with the idea of revising it, after experience, to the basis of actual conditions. So long as depreciation is recognized as a part of the cost of operation, it will make small difference under present circumstances whether it is figured on a straight line or mileage basis.

The cost of the original tires on the bus should not be considered a part of the amount to be depreciated. Theoretically the amount reserved out of revenues during the period a bus is operated should equal the original cost of the bus (excluding the tires) less its salvage or turn-in value. In all cases, where the experience is limited and the art is in a comparatively early stage of evolution, the amounts currently charged against the revenues and reserved may be considerably at variance with the actually sustained depreciation, but more extended experience will tend to improve the methods of calculating these charges.

Consideration must also be given to obsolescence and inadequacy, as well as wear and tear, in calculating depreciation charges. Physical depreciation, or the wear and tear of the bus, depends substantially on the following nine factors:

- The design of the bus.
- The quality of workmanship and material used.
- The character of maintenance.
- The efficiency of the driver.
- The grade and proper use of fuel and lubricating oils.
- The loads carried.
- The rate of speed.
- The character of service performed.
- The road conditions.

Because of these variable factors, it is difficult to suggest a standard practice for charging depreciation occasioned by wear and tear.

The factor of obsolescence, another element of depreciation, but not occasioned by wear and tear, should also be a matter of consideration, especially where there is likelihood of an appreciable advance in an art. At best, this is a problematical element and with respect to the bus at this stage of its evolution, at least, operators must apply

indefinite theories in their calculations if they attempt to estimate it.

There enters into this study, the practical consideration that many buses, if not all, which might be replaced in regular service by better developed units could be used in extra service as spares and in regular service on lines of smaller traffic demand; often the chassis and other parts of discarded buses lend themselves to further utility.

The factor of inadequacy, is also an element of depreciation. It is a burden which operates on the income in precisely the same way as obsolescence and is as difficult to measure. The factor of inadequacy in depreciation is substantially occasioned by the traffic demands. For example, a bus with a carrying capacity of twelve might take care of all or its share of the traffic today and later, because of increasing patronage, might have to be replaced with a bus with a carrying capacity of twenty-five.

Assuming that the replaced bus, or its parts, could not be further utilized the charges against income over and above the reservations made out of revenues for depreciation occasioned by wear and tear would reflect the factor of inadequacy. This burden may be kept within bounds or eliminated in at least two ways:

First—Buses found to be inadequate in regular service may be further utilized or their major parts utilized.

Second—In establishing bus service the size of the buses necessary to accommodate the varying traffic demand and traffic growth may be reasonably determined if careful consideration is given to the fact that the bus, because of the nature of its construction and the laws against overloading which are in force in many localities, is less elastic in capacity than the trolley car.

Because of these widely variable depreciation factors, each company must study its own situation and from future experience develop such method as will

adequately provide for renewals or replacements as they become necessary.

Depreciation on garage building and equipment must also be taken into consideration. As these facilities do not vary considerably from those generally used in railway operations it is safe to assume the same rate of depreciation in both cases.

No standard practice for providing for accident liability is suggested. Of the seventeen companies giving information, six set aside from 3 to 6 per cent of their gross revenue. In other cases the requirements as prescribed by law, either state or municipal, are followed. Generally speaking, each bus carries \$1,000 property damage and \$5,000 and \$10,000 liability insurance for any one injury or accident.

Attitude of Public—With one exception, the attitude on the part of the public favors bus operation by the street railway companies. This indicates, that the public is showing a preference for dependable service by a responsible, experienced transportation agency to that furnished by an agency whose interest in transportation ceases immediately when profits disappear.

It is also recognized that through supplementing the rail service with buses additional territory is being served which could never hope to receive service from individual bus operation without a guarantee of immediate profit.

A very influential New England newspaper goes right to the heart of the matter in an editorial which says in part:

"Certain kinds of public service are essentially monopolistic, and transportation is one of them. It is as unsound economically that there should be two gas companies, two electric light companies and two telephone companies as that there should be two street railway companies, or, which amounts to the same thing, one street railway company competing for the transportation busi-

ness of the community with a number of bus lines serving precisely the same districts.

"The right solution is to give one company monopoly of transportation and then see to it that it fulfills all the obligations that go hand in hand with monopoly.

"The motor bus is a valuable agency of transportation, but it should be employed as an auxiliary to the system of transportation that constitutes the main source of reliance, instead of being a competitor of that system. As a flexible unit its primary purpose should be to serve territory not at present served by the street cars."

The tabulation of operating results presented represents a picture of what may be expected in the future. Certain elements of cost are as yet indefinite. None of the companies has been operating buses much longer than a year, consequently, their maintenance costs have had an advantage from the fact that their equipment was new and did not require heavy expenditures for repairs and renewals. It is quite possible also that the change from the truck chassis to one designed for passenger transportation may result in a decrease in this item.

So far the bus has had the advantage over the electric car by reason of the fact that the roadbed has been provided and maintained out of the general tax fund, but as the question of commercial use of highways is at present being given serious consideration throughout the country, it is entirely probable that the item of taxes will sooner or later be materially affected through changes in methods of taxation.

The most important factor to bear in mind in comparing the cost of bus operation with that of electric car operation is that, by reason of the smaller seating capacity of the bus, the cost per passenger is considerably higher than for electric car operation. The average cost per bus-mile, including

Note: Deficits are shown in italics.

taxes and estimated depreciation, based on the figures shown in the accompanying table is 24.6 cents. It is fair to assume the average seating capacity per bus to be twenty-five. On this basis, the cost per seat-mile of bus operation is 0.98 cents.

Data obtained from ten companies operating one-man trolley cars, exclusively, shows an average cost per car-mile of 25.7 cents, including depreciation and taxes. The cars of these companies have an average seating capacity of forty-two, resulting in a cost per seat-mile of 0.61 cents. On the basis of this comparison, the cost per seat-mile of bus operation is approximately 60 per cent greater than for the one-man electric car. These figures, however, do not include a return on the value of the property.

If this were computed on the basis of carrying capacity, the increase in bus cost per passenger would be greater by reason of the greater elasticity of the electric car. This is particularly true in localities where the number of passengers above the seating capacity of buses is fixed by law. An example of this is the state of Connecticut, where the law allows only two passengers above the seating capacity.

This not only means an additional investment which is idle the greater part of the time, but because of the smaller seating capacity of the bus, it will require at least three buses to furnish the same number of seats as two trolley cars.

The committee reports it is unable to furnish any historical data of value on trackless trolleys as experience by street railway companies is confined to four companies operating a total of seven buses and two in Canada operating a total of eight, none of which has been in service a sufficient length of time to furnish reliable data.

Another year, however, should be fairly productive of information, as the committee is informed that installations are contemplated at Richmond and Norfolk, Va.; at Philadelphia; at Rochester, and at Detroit.

The report was signed by R. R. Anderson, A. C. Blinn, W. H. Burke, A. H. Ferrandou, R. N. Graham, J. M. Ives, H. A. Mullett, L. H. Palmer, T. S. Wheelwright, J. K. Punderford, Edward Dana and W. J. Flickinger, chairman.

H. W. Alden, president of the Society of Automotive Engineers, read a written discussion of the report of the committee on bus operation, which is abstracted elsewhere in this issue.

V. E. Keenan, superintendent bus division, United Electric Railway, Providence, R. I., referred to the report as a fair and impartial treatment of a subject which has been the source of considerable controversy in recent years. The progress made by manufacturers of bus equipment in recognizing the limitations of the customary type of truck chassis for bus work augurs well for further development in bus design. The need for standardization and the use of interchangeable parts was re-

ferred to, and the advantages of co-operation between the Society of Automotive Engineers and the A.E.R.A. were emphasized. The desirability of improvements in bus design to decrease the rate of depreciation and give a longer life were also pointed out. Referring to the convention number of the *ELECTRIC RAILWAY JOURNAL*, Mr. Keenan agreed that close study of the results obtained in the manufacture of pleasure vehicles by the use of interchangeable parts can be profitably applied to bus design.

The steps taken by the Washington Railway & Electric Company in installing bus service as an auxiliary to its present electric railway system were reviewed briefly by President W. F. Ham. He stated that the bus can now be used in many situations where it is not profitable to build a new car line, or can be applied where it is not profitable to rebuild an old line. The advantages of the bus under certain conditions for furnishing service on extensions of existing railway lines were also mentioned by Mr. Ham. He said, however, that a transfer charge between bus and cars is very desirable.

A brief description was given by G. B. Anderson, transportation manager Los Angeles Railway, of the steps taken by his property in the establishment of bus lines to forestall competition by independent companies. He said that although a transfer privilege is in effect between buses and cars, a fare of 10 cents is charged if the passenger rides on a bus during any part of his journey.

L. H. Palmer, general manager United Railways & Electric Company, Baltimore, amplified the report relative to the operation of trackless trolleys on his property by stating that the operating costs for these vehicles were increasing rather than the reverse. He expressed the opinion that trolley bus design is far from perfected and that considerable development is necessary before it will become a practical transportation vehicle.

In concluding the discussion, Mr. Flickinger, chairman of the committee, maintained that comparison of operating costs as between buses and rail cars must be made on the basis of cost per seat, in order to give a true picture of the actual results that could reasonably be obtained.

Wednesday's Session T. & T.

The joint session of the Transportation & Traffic and Claims Associations was called to order promptly by President Seely of the former association. The report of the committee on accident prevention was presented by H. B. Potter, co-chairman. He pointed particularly to the answers to the questions regarding the most hazardous elements in the operation of cars.

Joint Committee on Accident Prevention

The study made by the committee on safety work last year was continued by a committee under the name of the committee on accident prevention, which analyzed accidents with reference to causes and the relative number in different areas on each property. It was determined that better concrete results would be obtained by the committees on accident prevention of the two associations carrying on the work jointly.

The duties of the committee have resolved themselves into two important studies: (1) Analyze accidents. (2) Ascertain the extent of the co-operation between electric railways and various public bodies.

The joint committee dropped the question of outlining the manner of conducting safety week campaigns for the reason that it is the feeling of the members that the safety week idea has been overdone in the past and that accident prevention has now resolved itself into an all-the-year-round endeavor. There is a great deal of data on this subject on file at the headquarters of the National Safety Council and the or-

ganization of the safety week has been fairly well standardized.

As a result of questionnaires sent out to member companies the joint committee has obtained some extremely interesting information. The committee feels that if the facts presented in this report will serve as an inspiration to the member companies for greater effort along the lines of accident prevention in the future, its work will have been well accomplished.

Analysis of Accidents of 113 Electric Railways — The committee received a response from 113 electric railway properties situated in thirty-nine states and the Dominion of Canada. These properties represent 27 per cent of the electric railway mileage, 25 per cent of the gross receipts and 31 per cent of the passengers carried. The figures obtained are, in the opinion of the committee, fairly indicative of the trend of accidents in the years 1920, 1921 and 1922.

The committee has ascertained from authorities in other lines of work that the year 1922 was a year of high accident rate in industry as a whole, whereas 1921 was a banner year from the accident standpoint.

The results of our investigation, generally speaking, show that the electric railways as a whole had a high accident rate for the year 1922 as compared with 1921 as far as accident frequency is concerned, but the total cost to the railways shows a great decrease, and, further, the miles operated in 1922 exceeded 1921, which in turn exceeded 1920, and passengers carried in 1922 exceeded 1921. These results should be

extremely encouraging to the electric railway industry.

The following totals are obtained from the answers to twelve questions submitted to the 113 electric railways:

	1920	1921	1922
Total number of all accidents.....	220,950	204,034	214,563
Total number of employees injured.....	13,523	12,777	13,183
Total cost of claims, injuries, damages, including costs and payments connected with operation, claims and safety departments, welfare and workmen's compensation inclusive of legal, medical and private investigations.....	\$9,009,381.75	\$7,759,852.86	\$7,472,731.19
Total accidents in which motor vehicles were involved.....	79,262	79,808	89,582
Total number of car collisions.....	10,831	7,216	7,367
Total number of fatalities, all causes.....	582	496	474
Gross income, all operations.....	\$280,503,326.20	\$281,774,993.45	\$279,433,916.10
Number of car-miles operated.....	608,810,174	611,111,592	626,944,541
Average total number of employees in service, all departments.....	89,844	90,161	90,920
Number of passengers carried, free and transfer.....	4,783,667,505	4,558,735,675	4,594,457,155
Number of cars operated.....	16,075	16,011	16,265
Miles of track.....	11,576.11	11,887.17	11,889.41

The above results of accident prevention work are particularly interesting when carefully analyzed. For instance it is assumed that the total number of accidents given above are the total number of accident reports received which may or may not have involved cost to the company or real injury to the person or property. In the last analysis, the item which most clearly demonstrates the results of accident prevention is the third item above, showing the total cost. This total cost in 1922 was \$1,350,000 less than in 1920, or approximately 16 per cent. In this connection the following figures are extremely interesting:

	1920	1921	1922
Cost of accidents per 10,000 car-miles operated.....	\$148.00	\$127.00	\$119.00
Cost of accidents per 100,000 passengers carried.....	188.00	170.00	163.00
Cost of accidents, percentages of gross earnings.....	3.2%	2.76%	2.68%
Average cost per accident reported.....	\$42.20	\$38.00	\$34.80
Number of accidents reported per 10,000 car-miles.....	3.39	3.32	3.42
Number of accidents reported per 100,000 passengers carried.....	2.20	2.04	2.14

Fatalities—Various public authorities and accident prevention organizations in the past have laid considerable stress on the results obtained by accident prevention in reducing the number of fatalities. The committee would call to your attention especially the results obtained by these electric railways in reducing the number of fatalities, which in 1920 were 540, to 471 in 1921 and 450 in 1922.

What Causes Accidents—The committee submits causes of car collisions, alighting and boarding accidents, persons struck by car, collisions with other vehicles, submitted by the 113 companies in answer to questions sent out by the committee.

The most hazardous element in the operation of cars was stated by various operators to be streets car-auto vehicular collisions; automobile traffic; street crossing on down grades on paved streets; monetary hazard; step accidents; violation of operating rules and slippery rails; traffic congestion; grade crossings; hills, snow, ice and cold weather; the human element; railroad crossings, fog and cows on track; narrow streets; slick rails.

Co-operation Between Electric Railways and Various Public Bodies, and

What Has Been Done Toward Accident Prevention Through Special Methods Introduced by Member Companies—A sub-committee was appointed to obtain this information and it confined

its questionnaire to three questions which, with replies received from the company membership of the association, are as follows:

Q. 1. Have you adopted special methods for the reduction of accidents on your property, by means of:

(a) Adoption of a code of safety rules? To this question forty-one members answered No, and forty-one answered Yes.

(b) By the appointment of a safety director? To this question, forty-nine answered No, and thirty-three Yes.

(c) By holding periodical safety meetings? To this, thirty-five answered No, forty-seven Yes.

(d) By the formation of a safety committee? To this, thirty-four answered No, forty-eight Yes.

Q. 2. In what manner, if any, has the chamber or commerce or other civic bodies in your city assisted in an organized way in helping you to carry on effective safety work in your community? Replies received from forty-five member companies indicated that local chambers of commerce or other civic bodies had furnished no special organized assistance while thirty-seven member companies reported that the chambers of commerce in their cities had in various ways assisted in an organized way in furthering the cause of accident prevention.

Q. 3. Is there in your city a local safety council, and if so, to what extent has it co-operated with the various departments in the effort to reduce accidents? Forty-nine member companies reported that in their cities there was no safety council; thirty-three companies reported that there is, and that the same is co-operating fully in accident prevention work.

The report was signed by F. W. Mulford, F. H. Warren, M. W. Bridges, Charles W. Chase, James Harmon, S. B. Ireland, A. W. Koehler, C. E. Morgan,

R. M. Reade, Harry Restofski, E. M. Walker, Alba H. Warren, J. V. Sullivan, sponsor; W. H. Boyce, sponsor; H. O. Allison, co-chairman, and H. B. Potter, co-chairman.

President Seely congratulated the joint commission on the work it has done. He suggested that individual companies can take the cue from the report and collect material from their own records, subdividing it according to causes of accident.

The formal discussion was opened by W. G. Fitzpatrick, general claims attorney Detroit United Railway. He said that speaking from the standpoint of the claims man the situation is gratifying. There has been a considerable reduction in accidents on the basis of passengers carried and miles operated. He said that the claims men and the transportations man should and must collaborate and that they should have a sympathetic attitude toward each other. The operator of the cars must, however, become the dominant factor in the situation.

The principal thing is discipline, discipline and still more discipline, said Mr. Fitzpatrick. He felt, however, that compensation laws have a baneful influence, even if they do not directly cause accidents. He said that trainmen should be directly responsible to their superiors and not to some board or commission.

Barron Collier, who was asked to give a written discussion, was unable to be present. His discussion was read by Marcus Dow. According to Mr. Collier, perhaps no industry can do so much for the safety movement as the electric railways, for they have the energy, brains and resources with which to do constructive work. He pointed particularly to the accident record of Greater New York, stating that there were killed in the streets by vehicles last year 965 persons, approximately half of whom were children under sixteen years of age, and more than 6,000 persons were injured.

"I have little faith that the slogans which have been chanted will bring about results," said Mr. Collier, "but I do think that when we go to the root of accidents, the causes for them, as you have done in your report for this year, we have started along the right line to cut down casualties."

Mr. Dow supplemented these remarks by stating that saving the lives of children is a work dear to the heart of Barron Collier. The thing which makes everything in the world worth while is human life. It is bad enough that nearly a thousand lives were sacrificed in the year, but that half of them were children under sixteen years of age was the appalling fact.

President Muir of the Claims Association conducted the informal discussion. Successful safety work is impossible unless there is a spirit of co-operation between the transportation man and the claims man, said Mr. Muir. One can't be successful without the other. They must accept advice from counsel and from each other.

J. H. Handlon, Market Street Railway, San Francisco, said the development of safety devices for cars and safety practices promulgated by public authorities, as well as statistical methods devised for recording and classifying accidents were acting to better the situation. He said that some of the things done decreased certain classes of accidents but increased others. Better methods of selecting platform men were advocated by him. Eccentricities of various men in selecting applicants were scored. Following this care should be taken in the selection of men and they should be watched from the day they are accepted all during the period of training. He believed that it seemed advisable to adopt a follow-up method and give the men a probationary period before they are given full charge on the cars.

Attention was called to certain matters of the report that do not deserve compliment by L. H. Palmer, United Railways & Electric Company, Baltimore. Statistics presented show that half of the companies are not co-operating with the National Safety Council. Many companies have not formed safety committees or appointed safety directors. He thinks that it is an outrage that the companies have not taken advantage of their opportunities in doing work of this sort.

H. O. Allison, co-chairman of the committee, referred to the conclusion of the report on accident prevention, which was ruled out by the committee on publication. Mr. Allison presented this as his own contribution to the discussion. He said that there is no such thing as an unavoidable accident. Poor equipment, bad roadbeds, etc., may culminate in accidents, and therefore should be taken care of in advance. In this way many accidents are prevented which might have occurred otherwise.

James P. Barnes, president Louisville Railway, expressed his dissent from the view of Mr. Fitzpatrick and stated that he thought it equally necessary for a railway to have a brass band as well as to get down to brass tacks. The fact that the employment of men on the Beaver Valley Traction lines is in the hands of the safety engineer was brought out by W. H. Boyce, general manager.

The report of the committee on co-operation with the National Safety Council was presented by L. H. Palmer, general manager United Railways & Electric Company, Baltimore.

Co-operation with the National Safety Council

The committee on co-operation with the National Safety Council early in the association year, after correspondence with the headquarters office of the Safety Council, picked out fifty-eight of the most important railway companies that were not members of the council and wrote to them, explaining the benefits of membership and urging them to join. All of the companies were written at least twice, by one or

the other of the committee, and in each instance reply was requested. Of this number thirty made no reply, fifteen declined to join, ten joined or had benefits of the council through allied companies and three have the matter under consideration.

The committee was much disappointed in the response to its letters and it appears that the only way in which effective results can be obtained in future is through personal contact of members of the council with those who are not.

The report was signed by W. H. Boyce, Wallace Muir, L. H. Palmer, chairman.

In discussing this paper Mr. Barnes told of the benefits lost to railway companies by their failure to join the National Safety Council.

A paper on "Maintenance of Men" was read by Dr. H. E. Fischer, chief surgeon Chicago Elevated Railways.

Following the presentation of the paper, Dr. Bascom, Illinois Traction System, stated that railways should encourage their employees to consult the company doctor for even minor ailments. He emphasized also the danger of employing men suffering from syphilis.

At the conclusion of the discussion,

President Seely of the Transportation & Traffic Association thanked President Muir of the Claims Association for the co-operation of the latter body in joint meeting. Mr. Muir expressed his gratification at the successful character of the meeting. There was no report from the committee on resolutions and the meeting therefore proceeded with the installation of new officers.

The new president, J. K. Punderford, was escorted to the chair by Mr. Smith and accompanied by the other new officers and members of the executive committee. In a graceful speech, the retiring president expressed his wish for Mr. Punderford's success in the ensuing year. Mr. Punderford described briefly the extensive wire pulling that he had done in order to gain his new eminence and promised to perform the duties of the office to the best of his ability.

He presented the badge of past-president to Mr. Seely and stated that no better testimonial of the success of his service as president of the T & T Association could be asked for than the well attended and highly interesting meetings during the convention. In accepting the badge, Mr. Seely expressed his deep gratification. There being no further business the meeting adjourned.

Biographical Sketches of Newly Elected Officers

Britton I. Budd

A KEENER, abler leader than Britton I. Budd could not have been selected for the American Electric Railway Association. This statement was made in the CONVENTION DAILY issue of the ELECTRIC RAILWAY JOURNAL in announcing Mr. Budd's election. Nothing that could be said about Mr. Budd would state the case better. It does not alter the fact that Mr. Budd would be the last one to subscribe to this view of him. The statement was made not only because of the kind of thinking Mr. Budd has contributed in the counsels of the association, but also because of the splendid record of achievement he has made with the Chicago, North Shore & Milwaukee Railroad and the Chicago Elevated Railroads. In selling transportation and developing good will, Mr. Budd probably stands out as the leading figure in the industry. Furthermore, so many ideas of modern electric railroading are being worked out on his properties that one may learn at every turn some new and progressive method of doing the thing better or at lower cost.

MR. BUDD'S ALL-AROUND EXPERIENCE

A plain statement without frill of the accomplishments made under Mr. Budd's direction confirms the view that there are still many things that can be done to improve the electric railway outlook.

Mr. Budd makes a good president in another respect. He is both interurban

and street railway man, and rapid transit, too. There is probably not another man in the industry who is all three. Moreover, he is also president of the Public Service Company of Northern Illinois, one of the Insull electric and gas companies.

Mr. Budd has been associated with the transportation business ever since he left school, at which time he took a situation in the surveying department of a steam railroad in Ohio. In 1893, during the World's Fair at Chicago, he was associated with the Intramural Railway. With the incorporation of the Metropolitan Elevated he saw Chicago's future transportation plans take real form, and when actual operation of that line was commenced in May, 1895, he obtained a position as clerk in the storehouse. With the Metropolitan his rise was rapid, for he soon became storekeeper, then purchasing agent and finally general manager. When Mr. Hetzler, president of the Metropolitan, left in 1910, Mr. Budd was elected president of the company.

In 1911 a consolidation of all the elevated lines in Chicago was brought about, and Mr. Budd was chosen president of the combined system. Besides being president of the Chicago Elevated Lines, he became president of the Chicago, North Shore & Milwaukee Railroad at the time of that line's reorganization in 1916, and more recently assumed the same position with the Chicago and Interurban Traction Company. He was

elected president of the Public Service Company of Northern Illinois early this year.

Further evidence of the accomplishments of Mr. Budd is afforded by the award of the Coffin medal to the Chicago, North Shore & Milwaukee Railroad, headed by him. The work of that road is reviewed in the report of the Coffin committee, presented elsewhere in this issue.

All in all Mr. Budd's election bids fair to insure another year of great accomplishment for the association.

Harley A. Johnson

HA. JOHNSON, who was elected president of the Engineering Association, is an alumnus of Purdue University, class of 1905. By progressive steps, taken during the past eighteen years, he has risen to the position of assistant to the general manager Chicago Elevated Railroads. In his present position he assists the general manager in carrying out the details of operation and maintenance of the property.

While in college Mr. Johnson was president of the mechanical engineering society. He was active in all student matters, being elected to Tau Beta Pi after one year in college. He graduated with the highest mark in the mechanical engineering class and was the representative of the mechanical engineers on the commencement-day program.

During his days at Purdue, and immediately following, he was a special apprentice in the mechanical department of the C., B. & Q. Railroad intending to enter the steam railroad field as a life work. In this position he worked in the drafting room, as a locomotive fireman, in the testing laboratory, in the locomotive erecting shop and on locomotive road tests.

In 1905 he entered the service of the Metropolitan Elevated in Chicago as helper in the shops, and worked his way up through different departments, including those of maintenance of way and transportation. In 1907 he was made engineer of car equipment, and three years later master mechanic, having the duties of superintendent of equipment.

When in 1911 the elevated railways consolidated, Mr. Johnson was made master mechanic of all of them, his title being shortly changed to superintendent of shops and equipment. In this position he handled the design and followed the construction of the new steel cars purchased in 1914 and 1915. This was his most responsible job up to that time. In 1916 his duties were extended to include similar ones for the Chicago, North Shore & Milwaukee Railroad.

In 1918 Mr. Johnson was made organization engineer for the four elevated railroads, being promoted three years later to his present position. He has charge of the educational work on the elevated lines and is chairman of the expense and budget committee. This committee approves all items of budgets and special authorizations for

work, both construction and operation. He helped to organize the local company section of the American Association and was president for the first two years. He was on the original committee that inaugurated safety work on the "L" system. He was detailed by Mr. Budd to investigate the subject of motor buses for the North Shore Railroad.

Mr. Johnson has been long active in committee work of the Engineering Association. He also interests himself in Chicago technical and other organizations. He is a member of the Western Railroad Club, the Western Society of Engineers, the American Institute of Electrical Engineers and the Illinois Electric Railways Association.

J. K. Punderford

THE newly elected president of the Transportation & Traffic Association, J. K. Punderford of New Haven, Conn., is general manager of the Connecticut Company, which operates 802 miles of track and owns nearly 1,500 motor cars and a number of buses. It operates a large majority of the electric railways in Connecticut and serves all of the large cities in the state. Mr. Punderford has been connected with this property or its predecessor in New Haven for thirty-one years.

The new president of the Transportation & Traffic Association is a native of New Haven and naturally went to Yale University. He took the combined electrical and mechanical engineering course then given and was graduated in 1892. His first job was an electric railway one, assisting in the erection of the power station of the West Haven Street Railway. In the autumn of 1892 he went to Schenectady to take the students' course in electrical engineering then being given in the Edison works, but returned to New Haven and became connected with the Fair Haven & Westville Street Railway, then the largest electric railway property in the city.

At first he was engaged in the track department, but later entered the operating department, and when the company acquired the other electric railways in New Haven and vicinity he was made general manager of the combined system. Later, when the New York, New Haven & Hartford Railroad purchased the property and the other electric railways in the state Mr. Punderford was retained as general manager of all of the combined properties which now comprise the Connecticut Company.

Although most of Mr. Punderford's active business career has been in the transportation side, he has never lost his interest in engineering, especially in trackwork, and has given quite a little of his time to this department.

Mr. Punderford has always taken an interest in association affairs and served last year as first vice-president of the Transportation & Traffic Association. He is also an ex-president of the Union League Club of New Haven and an ex-president of the Connecticut Society of Civil Engineers.

Information Bureaus Meet

AT THE invitation of W. H. Sawyer, president East St. Louis & Suburban Railway, representatives and officers of state and sectional associations and directors of the public utility information bureaus, gathered for a luncheon at the Marlborough-Blenheim Hotel on Tuesday. There has been such a rapid expansion in the number and work of these information bureaus it was believed much good could be accomplished by such an assemblage. Several officers and past officers of the association and representatives of some of the sectional organizations were present.

Those in attendance were as follows: Representatives of public service information bureaus—J. S. S. Richardson, Philadelphia; H. M. Lytle, Chicago; Joseph B. Groce, Boston; Benjamin E. Ling, Cleveland; A. B. McCrum, Charleston, W. Va.; Frantz Herwig, Milwaukee; John N. Cadby, Madison, Wis.; J. W. Holcomb, Cleveland; and Frank Bellville, Louisville, Ky.

Sectional association representatives—W. V. Hill, manager California Electric Railway Association; L. E. Earlywine, secretary Central Electric Railway Association, and E. N. Willis, secretary Southwestern Public Service Association.

Among the officers of the association and delegates from member companies were: President C. D. Emmons; Vice-Presidents B. I. Budd and J. N. Shanahan; Past-Presidents P. H. Gadsden, J. J. Stanley and L. S. Storrs; Secretary J. J. Welsh; Treasurer Barron Collier; and E. C. Faber, J. H. Alexander, J. P. Barnes, C. D. Cass, W. P. Strandborg, Labert St. Clair and J. W. Colton.

The most extended address was by Mr. Lytle of Chicago, a pioneer in the movement. Others who spoke were Messrs. Budd, Collier, McCrum, Richardson, Groce, St. Clair, Strandborg, Willis, Hill, Ling and Cadby.

New Officers of the Accountants' Association

At the meeting of the American Electric Railway Accountants' Association on Oct. 11 the following were elected officers of the association:

President, E. M. White, treasurer Binghamton Railway, Binghamton, N. Y.

First vice-president, W. L. Davis, auditor Lehigh Valley Transit Company, Allentown, Pa.

Second vice-president, J. J. Duck, general auditor Chicago Surface Lines, Chicago, Ill.

Third vice-president, Walter Shroyer, secretary Union Traction Company of Indiana, Anderson, Ind.

Executive committee: L. E. Lippett, auditor Auburn & Syracuse Railway, Auburn, N. Y.; T. B. MacRae, general auditor Metropolitan West Side Elevated Railway, Chicago, Ill.; O. H. Bernd, secretary and auditor Des Moines City Railway, Des Moines, Iowa; E. H. Reed, auditor Brooklyn City Railroad, Brooklyn, N. Y.

Engineering Association Proceedings

The Advance of National Standardization Was One of the Outstanding Features—Methods of Handling Materials and Supplies, and of Accounting, Are Given Consideration—Arrangements Are Completed for Revision of the Engineering Manual

THE first session of the Engineering Association was held Monday afternoon, Oct. 8, with President L. C. Datz presiding. President Datz's address, which outlines the achievements of the association, follows:

President's Address

In his presidential address to the Engineering Association, L. C. Datz reviewed the accomplishments of the various sub-committees and the work of the association during the year and made several suggestions as to its future course. He spoke of the work of the committee on methods of voting on standards, as well as that of the committee on revision of the Engineering Manual. He stressed the amount of work that has been done on this revision and mentioned the fact that the executive committee of the American Association had approved the request to print the new manual.

Mr. Datz described the report of the committee on heavy electric traction and spoke of a question as to the proper scope of its activities. Mention was made also of the report of the special committee on wheel and rail contours, the equipment committee and that on buildings and structures. Praise was given to the committee on wood preservation for its work during the year and also to that on air reservoir specifications. The report of the committee on purchases and stores was praised by Mr. Datz, as was that of the committee on way matters.

Electrical problems were covered in the reports of the special committee on automatic substations, that on power distribution and on power generation. Increasing activity of the Engineering Association was mentioned in connection with the drafting of a policy to establish a definite and simple procedure in matters relating to the American engineering standards committee. Continuing, Mr. Datz said:

A great deal of serious thought has been given in the past few years to various phases of the Engineering Association, its activities and methods and the effect its results have in the electric railway industry.

One of the most important questions is that pertaining to standards. Is the present method of appointing the standards committee and the way it functions conducive to obtaining effective results? To this I would say "Yes" conditionally, because a committee of fifteen men, nine of whom represent railway companies and six represent manufacturers, can be selected that will guard this phase of the work efficiently, if the committee be carefully chosen with regard to necessary ex-

L. C. Datz
Retiring President

perience to pass upon such matters intelligently.

In connection with our standards and the use of same by our companies, the revision of our Manual and the adoption of some of our standards as American standards by the A. E. S. C. will aid materially in accomplishing results. I am pleased to state that there seems to be a noted improvement in the use of association standard for 7-in. grooved girder rail. I know personally it has been laid in New Orleans, Memphis, Knoxville and Little Rock in goodly quantities in the last two years. However, there is room for a great deal of improvement, and with the constant endeavor of our association to make our standards represent the last word in the art, we should do everything necessary to bring the use of same about, in order to offset the criticism for non-use of association standards we have been hearing so much.

Then there has been a great deal said about too many associations working independently on allied subjects. We should have ever before us the

elimination of wasted effort and expense incurred in duplication of work by various technical associations on subjects in which they are interested individually. A great deal of this duplication can be eliminated by joint effort of interested associations, and I am pleased to say that it is becoming the practice more and more for the various associations to co-operate along these lines. The American Engineering Standards Committee serves as a happy and efficient medium in a great many cases.

INDIVIDUAL MEMBERSHIP

I would like to see this association take the proper steps to further the inclusion of a course of public utility engineering in curriculums of colleges of recognized standing.

I want to call the incoming administration's attention to an opportunity to strengthen the Engineering Association by increasing the number of individual members. I am thoroughly sold on this idea, and I have been an individual member of the Engineering Association since my days in the drafting room some years ago. I speak from experience when I say that there are advantages incidental thereto that no man in justice to himself and the company he serves can afford to forego. These benefits follow active participation in the work of the association, in proportion to the well-directed thought and time put into it. Personal contact with other men interested in the same problems broadens a man's viewpoint, which cannot help but reflect favorably in the kind of effort he puts forth in his company's interest.

Although the Engineering Association has by far the largest number of individual members of any of the affiliated associations, there are still quite a number of men who should be individual members of this association, and we can render them a real service by bringing to their attention the benefits to be had by joining this association and taking an active part in its work. The dues are \$5 per year, extremely nominal, and are kept purposely so in order to make it possible for every man connected with the engineering end of the electrical railway industry, whether he be the chief engineer, mechanical, electrical or civil engineer, signal engineer, superintendent of equipment, of power, of railway or of overhead construction, master mechanic, inspector, foreman, draftsman, as well as purchasing agent, storekeeper, or assistant to any of these officers.

I would strongly recommend that a

H. A. Johnson
President-Elect

special committee to increase individual membership in the Engineering Association, to work in harmony with the American committee on membership, be appointed.

In conclusion, Mr. Datz mentioned the pleasure he had had in serving as the head of the Engineering Association and thanked the members for the assistance they had given him.

G. C. Hecker read the secretary's report prepared by J. W. Welsh, setting forth the various accomplishments of the association during the past year.

Secretary-Treasurer's Report

There were ten standing and six special committees during the year, the total personnel being 169, exclusive of the executive committee. Thirty-nine committee meetings were held, with a total attendance of 294 members.

Co-operative work on the part of the committees with other associations has resulted in the completion of several important specifications, including those for track construction, prepared in co-operation with the American Society for Municipal Improvements, and the specifications for the manufacture of open-hearth steel girder rails of plain, grooved and guard types.

The committee on power distribution has co-operated with the American Society for Testing Materials in harmonizing the specifications for round and grooved high-conductivity trolley wire. The committee on way matters is co-operating with the American Railway Engineering Association in studying the design of substitute ties and in formulating specifications for crossings of steam railroads and electric railway tracks.

The recommendations of the 1922 committee on way matters regarding a research program in connection with the work of the committee on welded rail joints resulted in an appropriation of \$10,000 by the American Association and contributions amounting to \$13,477 by a number of member companies. This will be used for the construction and operation of the necessary service testing machines and for other expense involved in developing the several types of welded rail joints now on the market.

There is now under way the formation of an American Committee on Inductive Co-ordination, which will be representative of all interests involved and which the association is developing in connection with the National Electric Light Association and the Bell Telephone System.

Relations with the American Engineering Standards Committee are becoming increasingly important each year. Six of the Manual sections have been approved as "American standard" and one as "tentative American standard." Other proposals of the association will be taken up through sectional committees.

The committee on revision of the Engineering Manual has been active and it has been definitely decided to publish the Manual hereafter in the form of a bound volume to be reissued at intervals of from three to five years.

As to membership, the total number of individual members, Aug. 31, 1922, was 528. Since then twenty-five applicants have been admitted; twenty-seven members have resigned, and forty-seven delinquents have been dropped, making the net membership Sept. 15, 1923, 479.

The annual report of the executive committee was approved by title only, inasmuch as the report will be printed in full in the proceedings of the association.

COMMITTEE APPOINTMENTS

H. H. Norris, C. R. Harte and R. C. Cram were appointed as the convention committee on resolutions.

In the absence of C. S. Kimball, chairman of the committee on methods of voting on standards, G. C. Hecker read the committee's report. This was simply a progress report which recommended that the subject be continued. The report was approved.

Engineering Manual

R. C. Cram presented a report of the committee on revision of the Engineering Manual, explaining why it was necessary to have a committee investigating this subject. The difficulties encountered in endeavoring to keep the old loose-leaf Manual together and the expense of keeping it up to date were factors which finally led to the adoption of a bound volume. An appropriation of \$5,500 recommended by the committee for the purpose of revising the Manual has been approved by the executive committee of the American Association. H. H. Adams, in his motion to approve the committee's report, stated that he believed it was time to revise the Manual because of the unwieldy form of the old volume. The recommendation that the committee be continued was approved.

Heavy Electric Traction

The bibliography of heavy electric traction and electrification data has been checked and revised by Prof. R. B. Warner of Yale University. It has been suggested that a complete rearrangement of the list be made, classifying together all articles appearing in a given periodical during any one calendar year, and from this compiling the subject index. The work would thus comprise: (1) A group of articles in any one periodical; (2) a chronological grouping, and (3) a subject index. Subsequent additions may readily be made as desired without material addition to the cost of printing.

The committee recommends that a complete bibliography, rearranged as outlined, be compiled and printed next year and automatically revised from year to year.

With regard to branch line electrification the committee states that with few exceptions branch line electrifications were made several years ago and there has been no material development during recent years. The committee, therefore, has not made a comprehensive investigation of the situation, feel-

ing that such information would not be of material value, particularly in view of the recent tendency to substitute self-propelled cars for steam service on branch lines.

The self-propelled car is undoubtedly of interest to those responsible for electric railroads as well as to the operators of steam road branch lines.

The committee on equipment of the A. E. R. E. A. in 1912 compiled an extremely comprehensive report covering the development of self-propelled cars. The cars developed at that time were of various types, such as gasoline, steam, compressed air, storage battery, etc. Subsequent to 1912 an interruption seems to have occurred in the development of self-propelled cars for branch line operation.

Recently, renewed interest in the self-propelled car has been manifested. A number of roads in this country and abroad have adopted, and are operating successfully, a type of gasoline-driven car considerably smaller than those which were most common in 1912.

During the past few years the development of heavy electric traction has been of necessity somewhat slow on account of lack of funds available for expansion. Many railroads, however, have actively considered the question of electrification as a solution for their individual problems, and several engineering investigations have been completed and plans made for electrification. These are described in some detail in the report.

The report was signed by A. H. Armstrong, R. Beeuwkes, J. M. Bosenbury, H. W. Cope, J. H. Davis, J. V. B. Duer, E. C. Johnson, Norman Litchfield, A. S. Richey, C. H. Quereau, L. S. Wells, H. A. Johnson, John C. Davidson, vice-chairman, and Sidney Withington, chairman.

Sidney Withington, New Haven Railroad, added to the report the following data regarding Baltimore & Ohio Railroad locomotives: The company has bought two new electric locomotives, weighing 120 tons each, for use in passenger and freight service. The gear ratio is 19:83, and at 14½ m.p.h. the tractive effort is 19,400 lb. The maximum tractive effort is 72,000 lb., and the maximum safe speed is 35 m.p.h. The railroad is also rebuilding four old locomotives to bring their weight to 120 tons each. Cast-iron bal-last is being installed in the cabs. The gear ratio is also being changed.

Mr. Withington emphasized the importance of the bibliography, pointing out that the new plan outlined in the report calls for continuity. The old bibliography contained many errors which have been corrected. On the subject of the self-propelled car he said that this is making rapid progress, and many railroads are feeling their way in solving traffic problems by using this type of car, sometimes temporarily. No standardization is possible at this time. The data given in the committee's table are not complete, but a complete list of railroads to which questionnaires were sent will be appended.

H. A. Johnson, Chicago Elevated Railways, said that the question had been raised as to whether the committee on heavy electric traction has been functioning in accord with the wishes of the association. The original purpose of the committee was to keep the members informed regarding the progress of electric traction on steam railroads. It has been working principally along this line. A special committee was appointed by the executive committee to study this matter, and on behalf of this committee he recommended that the scope of the work be broadened to include heavy traction on urban and interurban railroads.

C. R. Harte, the Connecticut Company, said that the association is vitally interested in the self-propelled car of the type that the steam railroads are using. Electric railways must concern themselves in the development of auxiliary vehicles. Of these the bus is difficult to maintain, whereas the self-propelled car is rugged.

The report of the committee was then accepted.

Wheel and Rail Contours

H. H. Adams, Chicago Surface Lines, abstracted the report of the special committee on wheel and rail contours. He stated that the last revision of wheel contours was made in 1907. At five conventions since then revisions have been proposed but not acted upon. In 1922, however, the association deemed the matter important enough to appoint this special committee. The result has been that a set of contours has been agreed upon. These are the same for chilled and steel wheels below the tread line. An abstract of the report follows:

ABSTRACT OF REPORT

The committee submitted four contours of wheel flanges, each in combination with two widths of wheel treads and recommended that these be adopted as standard for both steel and chilled-iron wheels. An additional contour which is the same as that which is standard for the American Railway Association was also submitted for use where larger wheel flange and wheel tread are required.

The flange contours are alike for both steel wheels and chilled cast-iron wheels

STANDARD DIMENSIONS FOR A.E.R.E.A. PROPOSED STEEL WHEEL DESIGNS

Tread and Flange Contours Proposed for Steel and Chilled-Iron Wheels

A.R.A. Standard Wheel Contours

below the level of the tread. On steel wheels the back of the wheels follows a straight vertical line above the tread level. On chilled-iron wheels the curve of the flange contour is continued above the tread level to produce a gradual thickening of the metal.

The recommendations of the committee were that the wheel contours submitted be adopted as standard and that wheel contours shown in the Engineering Manual under Et. 4a be superseded and withdrawn. Also that the table of dimensions for steel wheels submitted by the committee be adopted as standard to supersede the present standard dimensions as shown in the Engineering Manual Section Et. 7b, this table being a revision of the dimensions to suit the new proposed wheel contours.

In addition to the Manual sections referred to, the proposed standards effect section Et. 18a, wheel mounting and check gages adopted in 1919; Em 3a, limit of wear for association flange contours adopted in 1916; Ws 2a, rules for determining gage of track on curves adopted in 1911. The committee recommended that these sections be referred to committees of the association for revision next year.

The report was signed by C. A. Alden, V. Angerer, George L. Fowler, J. M. Larned, J. H. Lucas, A. D. McWhorter, A. J. Miller, J. F. Miller, J. M. Yount, J. H. Hanna, vice-chairman, and H. H. Adams, chairman. H. Fort Flowers, a member of the committee, did not concur in the report.

The committee's recommendations were then approved, but the report was referred to the next equipment committee for revision of the tables which accompany the contours, with instructions that they be expanded to permit any standard contour to be obtained with any standard wheel diameter.

Discussion centered on the necessity for the providing extra metal in chilled wheels above the tread line. Experts in wheel manufacture explained that the extra metal is needed in chilled wheels to strengthen the flange. This is not required in the steel wheels and, moreover, they cannot be rolled to provide it. The American Railway Association endeavored to have this extra metal rolled but the attempt had to be abandoned.

Objection to the extra metal was

raised on account of the possible wear on girder guard rails, but it was pointed out that in practice no wear is caused by the wheels above the tread line. In fact, the contour of the guard rail provides clearance for this extra metal. The curvature on T-rails serves the same purpose.

The special committee was then discharged with thanks for its excellent work.

W. W. Wysor, United Railways & Electric Company, raised a question as to the desirability of using narrow treads, and Mr. Adams explained that the committee recommends the use of wide treads wherever possible.

H. Fort Flowers, Differential Car Company, explained his reasons for putting in a minority report on this subject. He said that undoubtedly the committee had recommended wheel contours that were in accord with the wishes of the way committee of two years ago. Since then, however, new rail contours have been adopted in several cities, emphasizing the advantages of a compound fillet. New wheels and rails should fit.

It has been claimed that a wheel contour will conform to a rail contour after 600 miles of wear and that, therefore, the compound fillet is unnecessary. This conclusion leaves out of account the fact that in this rolling process metal is taken from the flange, and the life of the wheel may be decreased by as much as 3,000 miles. Mr. Flowers favored the continuation of the special committee so that this matter could have further consideration.

R. C. Cram, Brooklyn-Manhattan Transit Corporation, on behalf of the committee on revision of the Manual, asked that the equipment committee be instructed to revise the contour tables promptly, and it was understood that this will be done before the Manual is reissued.

Mr. Cram brought up the question of the advisability of adopting a new standard grooved girder guard rail for curves. He stated that now about 75 per cent of the rail production is of association standard rails. The matter was also discussed by C. H. Clark, H. Fort Flowers and C. A. Alden.

Tuesday's Sessions A.E.R.E.A.

The second session of the Engineering Association convened promptly at the appointed time Tuesday afternoon with president L. C. Datz in the chair. The report of the equipment committee for subjects Nos. 1, 2, 4 and 5 was presented by the chairman, F. H. Miller. The report on subject No. 3, which included a review of existing standards with recommended changes, was presented by C. W. Squier.

Equipment

This year's equipment committee reported on five subjects. The first of these was a study of gearing. Information in regard to helical gears was obtained from twenty-six replies to a questionnaire. This is the third year that information has been obtained in this manner, and since three years is just about the average life of a modern heat-treated pinion, information in regard to actual life could be arrived at only by estimation.

There is a marked difference of opin-

ion, as reported, on the relative flange wear when spur or helical gearing is used; companies representing 47.5 per cent of the sets reported say that the flange wear is not greater with helical gearing than with spur gearing; 21.9 per cent say the wear is about the same, and 12.3 per cent say the difference is not noticeable.

With respect to the helical gearing running quieter than spur, companies representing 81.9 per cent of the sets reported say "yes" when new; 64.2 per cent of the sets reported say "yes" when half worn out, and 37.4 per cent of the sets reported have insufficient data to answer as to this when the gears are completely worn out.

Regarding the long and short addendum tooth, as applied to both the helical and the spur type of gearing, the leading manufacturers are agreed that it is an improved design. It is, of course, highly desirable that a standard form of tooth be adopted by all gear manufacturers. It was brought out that for long and short addendum gearing a

limit-of-wear gage for gears and pinions would be desirable and would be a great aid to shopmen in determining just when to remove a gear or pinion without sacrifice of mileage or danger of the gearing failing while in service.

A careful study of web holes in gear blanks was made and the report included a table of the size and location of web holes in railway motor gear blanks as at present furnished by manufacturers. This should enable users to familiarize themselves with the present size and location of web holes, and the equipment committee recommended that this subject be studied by next year's committee with an idea of reducing the number of these.

The second subject reported on was various devices for trolley contact and their effect upon trolley wire. Information in regard to this subject was also obtained by means of a questionnaire, from which the following conclusions have been reached:

1. That trolley wheels of manufacturers' standard compositions give mileage equal to those using special composition.
2. That solid wheels are preferable to built-up type.
3. That standard "U" or "V" groove is most satisfactory under normal operating conditions.
4. That wheels lubricated with grease in hollow pin give greater mileage than wheels lubricated otherwise.

The number of companies using or testing the sliding contact indicates a growing demand for a better device than the trolley wheel, particularly for high-speed service.

Subject No. 3 was a review of existing standards and recommendations for changes. Specification Eb 4b, recommended specification for air brake hose, was changed in a few minor details to bring this into conformity with a similar specification of the American Railway Association. Specification Ec 1c, standard dimensions for height of bumpers and platforms, was withdrawn and the specification recommended by the 1922 committee of equipment was substituted. Through a misunderstanding in the last printing, both the old and the recommendations of the 1922 committee were included.

Et 3c, design of axles for electric railway motors, was corrected in line with previous recommendations. An enlarged diameter for the standard E-2 axle, which was previously omitted, was added. E-12 axle was renumbered as E-1a, so that the order of drawings would be in the same sequence as that contained in the table of dimensions. The diameter for the gear hub and motor bearing flange of E-7 axle was changed from 8 in. to 9 in. and that for the E-9 axle from 9½ in. to 10 in., in order to bring these into conformity with the stepping used for other axles. A paragraph stating tolerances, which was recommended by the 1922 committee, was added to each drawing.

Standard specification Et 9b for quenched and tempered carbon steel

axles, shafts and similar forgings, and Et 11b, specification for annealed carbon steel axles, shafts and similar forgings, were changed in a few instances in order to bring these into conformity with similar specifications of the American Society for Testing Materials. Specifications for gears and pinions numbered Et 14b, Et 15b, Et 16b and Et 17b had the diameter and spacing for web holes withdrawn until definite recommendations regarding these could be recommended.

A careful review of the existing miscellaneous methods and practices referring to equipment was made, and the committee recommended that these be eliminated from the manual proper and that this subject be referred to succeeding committees for revision and republication in a separate pamphlet.

SPRING SUPPORTS FOR RAILWAY MOTORS STUDIED

Subject No. 4 included a study of spring supports for railway motors. Improved forms of spring supports were suggested and information given in regard to pressure and suspension which should be of particular use in design of future suspensions.

It was determined that it was desirable to have different types of spring supports for different sizes and weights of motors, but that it might be possible to eliminate some of the supporting methods now used, the motors were grouped into three classes, as follows:

(a) Motors up to 35 hp. for use on single-truck and lightweight double-truck cars, suspended by means of single spring suspension on the motor nose.

(b) Motors above 35 hp. and up to 75 hp. for double-truck service, equipped with suspension bar and double spring supports.

(c) Motors 75 hp. and over, for inter-urban and rapid transit service, having a rigid nose suspension.

Three types of improved motor suspension are submitted as examples of what might be done to improve conditions. The important matter of allowing for lateral material has been provided for, without distorting the springs. These suggested designs or modifications of them will no doubt cost slightly more than the present types of motor suspension, but should pay for themselves in reduced maintenance cost in a short while.

The committee thought that more accurate data as to the amount of permissible motion desirable and the downward and upward pressures obtained in service with different sized motors, due both to ordinary service and shocks, was desirable, and it recommended that this subject be continued by next year's committee.

Subject No. 5 included a study of standard dust guard designs as used by the American Railway Association. Designs were submitted for dust guards for five different sizes of journals, which the committee recommended for adoption as A.E.R.E.A. standards.

The report was signed by Walter S. Adams, Lewis J. Davis, Charles Gordon, J. L. Gould, Stuart Hazelwood, J. M. Hipple, A. J. Miller, M. O'Brien, E. D. Priest, E. S. Sawtelle, C. W. Squier, W. G. Stuck, A. Taurman, Daniel Durie, sponsor, Pierre V. C. See, vice-chairman, and F. H. Miller, chairman.

Recommendations of the standards committee were presented after each subject was ready for consideration. There was considerable discussion in regard to referring certain subjects as recommended by the standards committee back to the equipment committee in view of the urgent necessity of printing these in the Manual.

J. M. Hipple, Westinghouse Electric & Manufacturing Company, said that the allowance for bore of gears as recommended by the equipment committee would be a great convenience to both gear and truck manufacturers, and he felt that these should be approved. H. A. Johnson, Metropolitan West Side Elevated Railway, Chicago, in explaining the reason for the action taken by the standards committee, said that while undoubtedly the recommendations of the equipment committee would prove a great convenience to both truck and gear manufacturers, the standards committee felt that if tolerances for the bore of gears were approved, it would prevent the operating companies from specifying the pressure at which gears should be pressed on axles, which is desirable.

The report of the equipment committee was approved with the exception of parts recommended by the standards committee as being referred back for revision.

Co-operation Through Organization

A. D. McWhorter, Memphis Street Railway, then read a paper on "Organization and Accomplishments of Association of Electric Railway Men in Mechanical Departments of Southern Properties." It is abstracted elsewhere. The discussion brought out the fact that such co-operative work as was described has a stimulating effect on the men in the mechanical departments and is highly commendable. There was no adverse criticism of the plan.

President Emmons then came into the meeting to say a good word for the manufacturers and their exhibits. He urged the engineers to make the most of the opportunity afforded by the presence of so much equipment on the pier. Referring to the bus exhibits, he warned the engineers, in a humorous way, that they may have to revise their methods. They may have garages as well as shops to look after. What they must give is the transportation that the people want. The change to the bus is no more radical than occurred when horse railways were electrified.

N. E. Drexler, chairman of the committee on buildings and structures, presented the committee's report in abstract, taking up the four sections of the report in turn. Before taking action on the recommendations H. A. Johnson presented the recommendations of the

standards committee on those of the buildings and structures committee. The recommendation of the committee that a portion of the report entitled prepayment and postpayment inclosures be published in the Manual as miscellaneous methods and practices was disapproved. However, the standards committee approved the recommendation that the drawings of culverts, trestles and bridges, together with fundamental data, be adopted as miscellaneous methods and practices and also approved the recommendation that various sections of the Manual referred to in the report of the committee on buildings and structures be revised to conform to standards of various national associations. The recommendations of the standards committee relative to those of the buildings and structures committee were approved. Favorable action was likewise taken on the original report of the committee on buildings and structures.

Buildings and Structures

The report of the committee is divided into four general subjects: (1) Review and bring up to date the study of electric railway terminals for both city and interurban service under the following classifications: Passenger, freight, combination, and prepayment and postpayment inclosures; (2) review and bring up to date the study of waiting stations (other than terminals) of moderate cost for interurban lines; (3) continue the study and report on the design of small bridges, culverts and trestles, with a view to presenting information for good current practice; (4) review of existing standards.

Electric Railway Terminals for City and Interurban Service—The committee considers this subject of such importance that it is submitting only general data in the form of a progress report. Among the general features which should be given careful consideration are convenience of handling passengers to and from cars or trains, attractiveness of architectural design, ample and convenient track arrangement, comfort of passengers and economical arrangement of space. In the interior arrangement consideration should be given to harmony, ventilation, sanitation and utility. The general trend today is to foster a spirit of public relations by furnishing comfortable, attractive terminals. It is recommended that the study of the subject be continued by the same committee next year.

Accompanying the report are plans of the Kenosha station of the Chicago, North Shore & Milwaukee Railroad, the interurban terminal building of the Dallas Railway, the interurban central station of the Kansas City Railway & Light Company and three plans of the Newark terminal of the Public Service Railway. The latter three have been described in issues of *ELECTRIC RAILWAY JOURNAL*.

In connection with the design of freight terminals, it was thought that

a thorough study should be made to determine the proper location for the terminal with respect to the distribution of freight and accessibility for trucking. Provision should be made, either in the building or a possible extension thereto, to take care of future growth. The yard layout and general arrangement of track should be such as to permit of expeditiously handling cars to and from the freight house.

The building should be designed to be attractive in appearance and in keeping with other improvements on the property. It should also harmonize with surrounding improvements. The width of the freight building should not be too great, as this tends to increase the amount of handling and hand trucking. From the best information obtainable, it appears that a freight building with a platform on each side facilitates the handling of freight and is most generally recommended for this purpose. A long and rather narrow building is preferred. The recommendation of the committee is that the study of this subject also should be continued.

In a general way the remarks made in regard to passenger terminals and freight terminals apply also to combination terminals. This subject also is to be continued.

Considerable space is devoted to prepayment and postpayment inclosures. These are taken up under six headings: Change booth with automatic registering passimeter, fare booth with the registering passimeter released by the agent, change booth with registering coin box, ticket booth with cancellation box, automatic high registering turnstile, and the cashier system. These various types are discussed at length and many of them are illustrated. The committee recommends that the study of this subject be discontinued for at least a year, in order that existing types may have opportunity for further development.

Waiting Stations at Moderate Cost for Interurban Lines—The committee decided that these should be classified in three groups, open shelters, closed shelters and combination shelters.

The committee concludes that attractive waiting stations and resting places for patrons add greatly to the appearance of a property and that they do much to create public good will. They may be worth all they cost in money as well as worry. The recommendation is made that the study of this subject be discontinued.

Design of Small Bridges, Culverts and Trestles—The report of the committee goes deeply into this question, discussing pipe culverts, concrete box culverts, reinforced concrete culverts, concrete arch culverts, I-beam spans on concrete abutments, frame and pile trestles, etc. Many informative diagrams are included in the report. The discussion of the live load, dead load and impact is gone into thoroughly. The committee recommends that the typical drawings of culverts, trestles and bridges, together with the funda-

mental data covering their design contained in the report, be adopted as miscellaneous methods and practices, but the further study of the subject be discontinued.

Revision of Existing Standards and Recommendations—Most of this section of the report of the committee is devoted to a presentation of fire protection rules, instruction for the care and maintenance of automatic sprinkler systems, and the underwriters' rules relating to cars and carhouse wiring.

The report was signed by B. R. Brown, Charles W. Burke, J. D. Kent, James Link, L. L. Newman, J. M. Penick, S. J. Steiner, D. A. Scanlon, C. H. Clark, sponsor; John R. McKay, vice-chairman, and N. E. Drexler, chairman.

A very interesting report of the committee on wood preservation was presented by H. H. George, which was approved after the recommendations of the standards committee relative to the wood preservation committee report had been approved. The standards committee approved of the proposal of the wood preservation committee that the specification for brush treatment of wooden poles be adopted and also approved of the recommendation of the wood preservation committee that certain revisions be made in Manual section Wm 8b.

Wood Preservation

The special committee had no definite assignment, but the chairman divided its work into six subjects, covering specifications for various methods of treatment, the perforation process and a review of existing specifications. A voluminous report was presented, of which the following is a brief abstract:

Specifications for Open-Tank Treatment of Wood Poles—The committee's report includes photographs of the equipment used by several commercial open-tank pole-treating companies. The time available did not permit giving proper consideration to the subject of open-tank treating plants for the smaller pole-using companies. The committee, as a result of its studies, did not feel justified in recommending for adoption as a recommended specification and specification for open-tank pole treatment, but did include, for information only, specifications which are considered as standard in the industry for the open-tank treatment of Western red cedar and Eastern white cedar. They also included as information only specifications of the Western Cedar Pole Association for open-tank treatment of poles by the guaranteed penetration process. It is recommended that the ensuing committee be instructed to report on the question of open-tank pole-treating plants for small operating companies.

Specifications for Brush Treatment of Wood Poles—The committee submits for adoption as a recommended specification a specification for brush treatment of wood poles which covers the cases of treatment of poles subsequent as well as prior to installation. It also considered the advisability of per-

mitting the use of a grade of creosote oil suitable for brush application as an alternative to carbolineum or oils of a similar type, and although confirming the opinion of the previous committee that the latter was the most suitable oil for brush work, it was recognized that carbolineum was not always obtainable at a reasonable cost and that the use of the next best oil would be better than not to use any preservative whatever. The committee therefore recommended that the ensuing committee be instructed to report on the desirability of preparing a specification for a suitable grade of creosote oil for brush work.

Specifications for Pressure Treatment of Wood Poles—The committee found that while general practice followed certain uniform methods, still there was considerable lack of accord on a number of details of the various pressure treating processes for wood poles and it therefore did not feel justified in taking the initiative in this field by suggesting definite specifications for adoption as recommended specifications. Drawing from its own experience, as well as data obtained from various commercial pole-treating companies and other existing specifications, the committee prepared, and submitted for information only, five specifications for pressure treatment of both green and seasoned poles, and recommended that further study of the subject be continued by next year's committee.

Specifications for Pressure Treatment of Cross-Arms—The committee, after careful consideration of this subject, felt that since a cross-arm could properly be classed as a dimensioned timber, the treatment of this material was already satisfactorily covered by the existing specifications of the association Wm 8b, and that no special specification was necessary. It therefore recommend that further consideration of this subject be discontinued.

Perforation Process for Timber Treatment—The committee incorporates in its report data bringing up to date the information as to developments in this method of treating timber and includes several photographs of machines now being used commercially in this country for this process. The committee felt that this method of treatment of timber had not become sufficiently standardized to justify making definite recommendations, except that further study of the subject be continued by the ensuing committee.

Review of Existing Specifications—The committee has carefully gone over the existing specifications of the association and has kept in close touch with the action of other technical organizations interested in the subject of wood preservation. As a result, it recommended the elimination of the clause covering specific gravity requirements from the existing recommended specifications Wm 8b for Grades 1, 2 and 3 creosote oil, creosote-coal-tar mixture, preservatives for paving block coal-tar oil, and preservatives for paving block distillate oil, and also the addition of a suitable footnote to each of these speci-

fications to cover the question of specific gravity and the elimination of certain existing footnotes in order to make the specifications consistent with the changes now suggested. The committee also recommends certain renumbering of paragraphs in the specifications for the different grades of preservative oils.

Recommendation is also made to revise the specification for "float test" in the present recommended specifications for methods of sampling and analysis of creosote oil, as well as the complete revision of the section covering coke test in the same specification.

The committee also concurs in the recommendation that the ensuing committee be directed to consider a specification for a suitable grade of creosote oil for brush or open tank treatments as an alternative to carbolineum for use where the latter is not available.

Several papers were included as appendices, including "The Decay of Poles and the Fungi Which Cause It," prepared by C. J. Humphrey, pathologist Bureau of Plant Industry, U. S. Department of Agriculture, Madison, Wis.; "Attack on Chestnut Pole by Carpenter Ants," by Chairman Howard H. George of the committee; "Preservative Oil for Wood Floors," also by Mr. George. Through the courtesy of Earl Stimson, chief engineer of maintenance of the Baltimore & Ohio Railroad, the results of the 1923 inspection of the experimental installation of treated ties at Herring Run, Md., were published as an appendix, and through the courtesy of J. H. Waterman, superintendent of timber preservation of the Chicago, Burlington & Quincy Railroad, the results of the 1923 inspections of the experimental installations of treated ties at various points on his system also included.

The report was signed by M. J. Curtin, W. H. Fulweiler, E. F. Hartman, E. L. Morier, C. A. Smith, E. A. Hoffman, R. V. Achatz, advisory associate; R. C. Cram, sponsor; A. P. Way, vice-chairman, and H. H. George, chairman.

A written discussion on the subject prepared by Roger F. Hosford, read in Mr. Hosford's absence by Warren M. Craft, follows:

"I have been asked to discuss this report, particularly with respect to the parts dealing with brush and open-tank treatment. This report has been very carefully prepared and the committee is fully entitled to the greatest reward which you can give, which is to make use of its recommendations in your own individual practice. I feel that the two principal reasons for the failure of some brush-treating enterprises that have been based upon this experimental work of the forest service are: first, the use of insufficient quantities of preservatives, and, second, the application of the treatment to poles which had not been sufficiently prepared by seasoning to receive it. Green and partially seasoned poles will not permit of proper penetration by the preservative and also tend to open up the thinly treated layer obtained

soon after they are set, since they are in no way stabilized with respect to the occurrence of checking. In the application of the brush treatment, another feature to be kept in mind is that of taking care to give the workman proper tools. For example, it is not easy to apply fluid with a brush at the level of the shoulder and avoid having some of the hot fluid reach the hand and the lower arm. A long-handled brush with a gooseneck attachment should be provided for the application of this preservative. With respect to the open-tank treatment section of the report, I have this year had occasion to work on the treatment of green chestnut, and when the time of treatment is made sufficiently long, results with respect to penetration and quantity of creosote absorbed can be obtained which are substantially equivalent to those obtained with poles which have undergone a considerable period of seasoning. The open-tank treatment does not remove all of the water from the outer layers of the butt. The successful treatment of grain poles does not imply that they can be successfully used everywhere. Climatic conditions have a vital effect upon the life of poles. The last point to which I wish to refer is the matter of "perforating" or "puncturing," the preparation for receiving open-tank treatment. This process in the past two years has become commercially available for assisting in the treatment of cedar poles. Through its assistance cedar in a particularly seasoned state, which will not take any appreciable quantity of creosote or show any appreciable depth of penetration unless it is held in an open tank for many hours in hot creosote, has been found to yield satisfactory results when held in hot preservative only the customary number of hours."

R. H. Dalgleish presented a report of the special committee on air reservoir specifications.

Specifications for Air Tanks

Several meetings of this committee were held during the year and a preliminary specification prepared. This was submitted to the equipment committee for criticism and recommendations. The committee has been in touch with the boiler code committee of the American Society of Mechanical Engineers, but has not submitted a specification to it, and feels that the specification should have the approval of the equipment committee before submitting it to the A.S.M.E. While the specification has some points on which this committee and the equipment committee do not agree, they are matters that we believe can be easily adjusted.

This committee is not prepared at this time to recommend the specification for the approval of this association, but recommends that the subject be carried over and assigned to a committee next year for completion.

The report was signed by L. J. Davis, J. A. Leeper and R. H. Dalgleish, chairman.

It was a progress report and in-

licated that several meetings had been held, during which a number of specifications for unheated pressure vessels had been considered. However, the committee is not ready at this time to submit a specification, recommending that the subject be continued throughout next year. It was brought out in the discussion that followed that the Bureau of Standards had made numerous tests on the vari-

ous types of pressure vessels and that it would be well for the committee on this subject next year to investigate these tests. A sub-committee of the A. S. M. E. has the same matter under consideration and has been very friendly in co-operating with the association committee on this subject. The boiler code committee has assured this committee that no action will be taken without consulting it.

felt that the duty of handling all general accounts should be entirely in charge of the accountant, but subdivisions for obtaining cost data should be compiled in co-operation with the engineering department. He further expressed the fear that the committee report shows such minute subdivision as to make the accuracy of charges suffer due to the difficulty of training foremen to charge work to the proper accounts.

This same question was raised by C. H. Jones, electrical engineer, Chicago Elevated Railways, who maintained that subdivision of accounts should not be carried to the point where the foreman is required to spend a large amount of his time on clerical duties. T. B. MacRae, general auditor Chicago Elevated Railroads, illustrated the difference in the viewpoints of the accountant and the engineer by pointing out that the accountant thinks in figures, whereas the engineer desires a complete picture of a given situation. In order to maintain the desired contact between the two departments, this property has an engineering auditor who is in a position to compile cost information in the way which is most desirable for the purposes of the engineering department. Mr. MacRae questioned the use of the word "depreciation" in the committee's report and preferred the term "reserve" to indicate more accurately the function of this group of accounts.

The ruling of the United States Supreme Court which fixes the value of a property at the time the rates are made as the proper basis for rate making was given by C. R. Harte, construction engineer the Connecticut Company, as a primary reason in favor of accurately subdivided cost accounts. He stated that a knowledge of past costs is essential to the compilation of existing values for rate-making purposes. This value, he stated, can be set up only when cost figures of the property are also available in terms of man-hours and materials. In carrying out the work of cost keeping he felt that the engineer should co-operate in preparing the schedule of subdivisions and that the accountant should keep the records. Mr. Harte expressed satisfaction with the report of the committee as an initial step in the study of this problem and as a basis for further discussion and work.

Further discussion by H. H. George, engineer maintenance of way Public Service Railway; Herbert Jackson, supervisor underground lines Washington Railway & Electric Company, and Mr. Nicholson brought out the difficulty of properly making charges when accounts are too much subdivided, but emphasized the importance of carrying this subdivision as far as practicable. W. B. Yereance, consulting engineer, South Orange, N. J., commented on the report of the committee and pointed out that it fulfills the proper function of such a paper in that it outlines the general principles involved in the problems considered. The compilation of

Wednesday's Session A. E. R. E. A.

The meeting of the Engineering Association on Wednesday afternoon was called to order by H. A. Johnson, vice-president of the association, and was turned over to W. G. Nicholson, president of the Accountants' Association, who presided during the submission of the report of the joint committee on engineering-accounting. In his opening remarks Mr. Nicholson expressed great satisfaction with joint meetings of this kind, which he said tend to foster co-operation between engineers and accountants and to encourage that harmony which is essential on each individual property.

The report of the joint committee was read by J. E. Heberle, assistant secretary Capital Traction Company, Washington, D. C., and follows:

Joint Committee on Engineering Accounting

This year the committee devoted its effort mainly to a consideration of the existing Interstate Commerce Commission classification of accounts for electric railways with the view of recommending certain fixed sub-divisions which will provide not only a better record system but will facilitate obtaining helpful cost analyses, and presented for consideration such a proposed treatment of the way and structures group of accounts. The committee recommended that its work be continued during the coming year. The number of sub divisional accounts recommended is shown by the statement in the list below.

The report is signed by the joint committee: A. W. Grady, J. E. Heberle, Herbert Jackson, Charles H. Lahr, Edwin D. Dreyfus, Charles Rufus Harte, sponsor; Leon R. Brown, co-chairman, and George F. Dinneen, co-chairman.

Road and Equipment Accounts

Way and structures:
Engineering and superintendence (five sub-accounts).
Right-of-way (three sub-accounts).
Other land used in electric railway operations (no sub-accounts).
Grading (five sub-accounts).
Ballast (six sub-accounts).
Ties (two sub-accounts).
Rails, rail fastenings and joints (five sub-accounts).
Special work (four sub-accounts).
Underground construction (nine sub-accounts).
Track and roadway labor (ten sub-accounts).
Paving (ten sub-accounts).
Roadway machinery and tools (no sub-accounts).
Tunnels and subways (no sub-accounts).

Elevated structures and foundations (two sub-accounts).
Bridges, trestles and culverts (eight sub-accounts).
Crossings, fences and signs (four sub-accounts).
Signals and interlocking apparatus (three sub-accounts).
Telephone and telegraph lines (four sub-accounts).
Poles and fixtures (seven sub-accounts).
Underground conduits (four sub-accounts).
Distribution system (seven sub-accounts).
General office buildings (sixteen sub-accounts).
Shops and carhouses (sixteen sub-accounts).
Stations and miscellaneous buildings (sixteen sub-accounts).
Wharves and docks (no sub-accounts).
Park and resort property (three sub-accounts).
Cost of road purchased (no sub-accounts).
Reconstruction of road purchased (no sub-accounts).
Other expenditures, way and structures (no sub-accounts).

Operating Expense Accounts

Way and structures:
Superintendence of way and structures (thirteen sub-accounts, of which seven are for track and roadway and structures and six are for electric line).
Ballast (eight sub-accounts).
Ties (three sub-accounts).
Rails (three sub-accounts).
Rail fastenings and joints (five sub-accounts).
Special work (four sub-accounts).
Underground construction (eight sub-accounts).
Track and roadway labor (forty-two sub-accounts).
Miscellaneous track and roadway expenses (two sub-accounts).
Paving (nine sub-accounts).
Cleaning and sanding track (eight sub-accounts).
Removal of snow and ice (eight sub-accounts).
Tunnels and subways (five sub-accounts).
Elevated structures and foundations (seven sub-accounts).
Bridges, trestles and culverts (nine sub-accounts).
Crossings, fences and signs (four sub-accounts).
Signal and interlocking apparatus (five sub-accounts).
Telephone and telegraph lines (six sub-accounts).
Miscellaneous way expenses (no sub-accounts).
Poles and fixtures (twelve sub-accounts).
Underground conduits (three sub-accounts).
Distribution system (twenty-seven sub-accounts).
Miscellaneous electric line expenses (no sub-accounts).
Buildings, fixtures and grounds (twenty sub-accounts).
Depreciation of way and structures (twenty-five sub-accounts).
Other operations—Dr.
Other operations—Cr.
Equalization—way and structures.

In presenting this report Mr. Heberle indicated that the report was submitted as tentative for the purpose of inviting discussion of this important subject. Mr. Nicholson stated that accurate costs are of particular importance today due to the conditions which exist in the railway industry. M. W. Glover, general auditor West Penn Railways, stressed the advantages to be obtained from co-operation between engineers and accountants. He

detailed accounts, he felt, was a matter largely governed by the local conditions existing on the individual properties. He agreed that the services of an engineer in the auditing department provides for the necessary co-operation between the two departments on a large property and advocated frequent council meetings as a means of obtaining similar co-operation on smaller properties. He stated that detailed cost figures on specific jobs should be furnished by the auditor, but that such reports should be prepared only as long as the information is of value and then should be discontinued.

Mr. Harte, Mr. Spencer, Mr. Nicholson and Mr. Heberle concluded the discussion by taking up the question of charges for new construction and the division of charges between capital and maintenance accounts. It was the general opinion that the engineering department should co-operate in this work by indicating as far as possible the proper classification for work performed and that there should be a mutual responsibility. The report was accepted by the association and it was agreed that the work of this committee should be continued.

The report of the committee on way matters was abstracted by W. F. Graves, chairman.

Way Matters

Seven subjects are discussed in the report including one outstanding subject, viz., the review of existing standards. Conclusions and recommendations are submitted on all of the subjects assigned.

Standardization of Frogs—This subject has been considered by the committee on way matters since 1910 and revisions made from time to time, as the study of the subject developed. It is felt that the required number of frogs can be considerably reduced, probably by a process of elimination, that the subject warrants further study, and that definite recommendations can be made in another year. After carefully considering and reviewing the previous work, this year's committee made recommendations as to several revisions which should be incorporated in the Manual.

Car Clearance Easements—This subject was thoroughly considered and reported on in 1922 and the present committee considers it can go no further in this study from its standpoint. The subject should be discontinued as a way subject, but steps should be taken by the executive committee to appoint way engineers on the committee on unification of car design.

Design of Substitute Ties—A progress report is submitted and the results of an investigation into the records of the United States Patent Office are given. Co-operation with the American Railway Engineering Association has been obtained by the appointment of a way engineer to represent the association on the tie committee of the American Railway Engineering Association, whereby benefit may be

had from its extensive and thorough study of this subject. The subject of the design of substitute ties, particularly for use in paved streets, should be continued. A thorough investigation and study should be made of the substitute ties now available, the degree to which they have been used and the results of their use.

Design of Small Bridges, Trestles and Culverts—With a view to presenting information on good current practice, this subject was considered jointly with the committee on buildings and structures. The conclusions reached are stated in the report of the latter committee. It is the opinion that the subject cannot receive from two large committees the careful attention that it merits, and that it could be more satisfactorily handled by one committee. The subject of bridge, culvert and trestle design is one primarily concerning way engineers, these structures being generally designed and constructed by them. It is therefore recommended that the study of this subject be continued and that it be assigned to the ensuing committee on way matters. It is recommended that its further study by the committee on buildings and structures be discontinued.

Design of Track Construction for Paved Streets—A specification is submitted which is recommended for adoption. A similar recommendation is to be made by a concurrent committee of the American Society for Municipal Improvements, with which this committee co-operated. These specifications are very complete, covering the subjects of excavation, top soil and surface drainage, types of foundation, rails, rail joints, bonds, rail fastenings, ties, pavement base, rail filler and pavement. It is recommended that the further study of this subject be discontinued.

Welded Rail Joints—The welded rail joint committee of the American Bureau of Welding having been organized to pursue the scientific investigation of this subject in 1922, the subject was not assigned to the 1923 committee on way matters except to co-operate with the welded rail joint committee.

The most important work, that of securing funds for financing the work, was done after the report was prepared. The sum of \$10,000, appropriated at the convention in Chicago, has been supplemented by contributions from individual railway companies and manufacturers, so that the total fund subscribed up to July 1, 1923, amounted to \$23,477.

The first step in the actual testing of joints is the testing at various institutions of sample joints made up by certain railways in accordance with their own standards. The railway companies which will make up these joints have been selected so that samples will be secured representative of the four principal methods of welding, viz., cast-welded joints, thermit joints, seam-welded joints, Lorain bar weld and butt-weld. Each company has been

instructed to make twelve joints under actual service conditions, shipping six specimens to the Bureau of Standards, Washington, for tensile and repeated impact test, three specimens to Purdue University for cross-bending tests and three specimens to the University of Illinois for drop tests. A number of companies have made and forwarded these sample joints, but at the time the report was written no actual tests had been made.

The Emery machine at the Bureau of Standards will be used for tensile tests. It is not equipped with heads which will take the full rail section, and it has therefore been necessary in the past to plane away a portion of the head and base of the rail in order to insert it in the machine. This has resulted during a number of previous tests made by the bureau, in the breaking of the rail where it was weakened by the planing, thus precluding the completion of the test. In order to overcome this difficulty, the committee has designed and built special grips for the testing machine, which will permit testing the full section without cutting.

One of the most important tests considered by the committee is the repeated impact test. But the committee has been unable to find any form of testing machine entirely suitable for this work. However, considerable research has been done along this line by E. J. McIlraith, Chicago Surface Lines, and an ingenious method of determining the impacts caused by car wheels has been developed.

SPECIAL TEST TRACK DEVELOPED

Final plans of the rotary machine, designed for testing joints in circular tracks under as nearly service conditions as possible, were adopted and an appropriation was made to cover the estimated cost. In addition to the tension, bending, impact and service tests contemplated, there will be a number of special tests, such as measuring impact by Smith's decelerometer, tests for hardness and abrasion, microscopic examination and chemical analysis of weld metals.

This is one of the most important subjects for way engineers at the present time and warrants a great deal of further study and investigation. This committee recommends that the subject be assigned to the ensuing committee for further report.

Review of Existing Standards—In view of the pending revision of the Engineering Manual, the committee made a thorough review of the way matter specifications. Numerous recommendations for additions, changes and withdrawals from the Manual were made.

The more important ones are that the executive committee appoint a special committee to co-operate with all other committees of the Engineering Association to recommend a specification for "symbols for recording surveys"; that the ensuing committee on way matters be instructed to submit a design and specification covering "standard design and specification for

TABLE I—ANALYTICAL METHOD—TOTAL POWER SUPPLY AND DISTRIBUTION COST PER KILOWATT, ARRANGED AS TO DISTRICTS OF VARYING LOAD DENSITIES

solid manganese steel electric over steam railroad crossing" and co-operate with the committee on tracks of the American Railway Association.

It was also thought that the sectional committee of the A.E.S.C. having in hand the design of plain girder rails for use in paved streets should broaden its scope to include the design of joint plates suitable for use with those rails, and that the size and number of holes, length of plates, etc., be standardized.

The ensuing committee on way matters should be instructed to submit a specification "rules for determining the gage of track on curves," having in mind the work of the special committee on wheel and rail head contours.

The report was signed by C. A. Alden, V. Angerer, S. Clay Baker, W. R. Dunham, E. B. Entwisle, G. C. Estill, R. B. Fisher, H. Fort Flowers, A. E. Harvey, J. H. Haylow, E. M. T. Ryder, A. T. Spencer, F. Tingley, J. B. Tinnon, W. W. Wysor, C. F. Gailor, secretary; H. H. George, vice-chairman; W. F. Graves, chairman, and R. C. Cram, sponsor.

In the discussion of this report Howard H. George, engineer maintenance of way Public Service Railway of New Jersey, explained the results of several meetings with the American Society for Municipal Improvements in deciding upon the specifications for street railway track construction. The specifications submitted with the report on way matters will be presented to the American Society for Municipal Improvements for action at its 1923 convention.

V. Angerer, vice-president William Wharton, Jr., & Company, Inc., explained the co-operation which the committee on way matters had with the way and track committees of the American Railway Association. W. W. Wysor, chief engineer United Railways & Electric Company, Baltimore, Md., gave an abstract of subject No. 5 of the report on way matters relating to the work of the committee on welded rail joints. He supplemented this by an outline of the work which had been accomplished by the committee on welded rail joints in co-operation with the American Bureau of Welding and gave information as to progress which had been made since the report of the committee on way matters had been printed.

The report of the committee on way matters was approved for all subjects except No. 6, and in this the recommendations of the standards committee were approved. A vote of appreciation was recorded for the excellent co-operation of member companies in making up track joints for tests.

The report of the committee on automatic substations was abstracted by Walter E. Bryan, chairman of the committee.

Automatic Substations

The committee assignments were: (A) To outline a method or methods for studying the economics of the subject, which will serve as a guide for the study of any particular situation. (B) On the basis of the above outline, study and work out a number of specific examples, comparing costs and merits of different power distribution layouts. (C) To determine, if possible, the economic limits to which track drops can be reduced.

In connection with assignment A, the committee also undertook a study of the trolley voltage most advisable for congested districts.

ECONOMIES OF SUBSTATION LOCATION

It has been rather general practice in previous studies to draw up comparisons between plans involving various sizes and grouping of units on what might be termed a practical or "cut-and-try," basis. The present committee felt that more satisfactory comparisons might be obtained by the use of an analytical method, based on an idealistic and uniform arrangement of the distribution feeders. There are situations, however, where such a method would not apply, and recourse must be had to the so-called practical method. The committee, therefore, submitted both methods.

First Method—The particular advantage of the analytical method lies in the fact that the results are based on a uniform system of distribution and the preliminary results, therefore, are more truly comparable than if the distribution feeders were designed at the start on the requirements of the individual lines. After the completion of the analytical study, detailed layouts would have to be made, which, however, would be confined to those substations set-ups which from the

analytical study, showed the greatest economy.

The analytical method has its principal field of usefulness where a study is being made of a large urban system, or where the district under consideration has a fairly uniform load density. The results cannot be assumed to be conclusive, but may be materially modified by the supplementary detailed studies. The method readily lends itself, however, to a comparison of sizes and combinations of units extending over a wide range.

The measure of economy is taken as the summation of annual costs per kilowatt delivered at the car. These costs are subdivided under "Power Supply" and "Power Distribution." Values of distribution voltage, load per feeder, etc., are assumed, together with unit costs of construction and operation, as governed by local conditions. The study shown covers substations ranging from 1,000 kw. to 9,000 kw. in capacity, it being felt that stations larger than 9,000 kw. would undoubtedly be manually operated. Commercial sizes of converters from 1,000 kw. to 3,000 kw. are considered.

The committee prepared a set of tables as a part of its study, showing the various steps in the calculation for the range of capacities mentioned. Similar tables would have to be made up for any particular case. These tables include the assumed unit value and cost; annual cost for power supply and annual cost for distribution, based on standard meters.

Table I, reproduced herewith, sums up the cost of power supply and power distribution, arranged as to districts of varying load density. The cost of power supply is independent of load density, while it is evident that the cost of distribution will vary with the load density of the district served, varying inversely as the square root of the density.

Table II is a summation of the investment cost of the power supply and power distribution units. Similar to the distribution costs shown in Table I, distribution investment is inversely proportional to the square root of the load density. Hence, if the load density of any district is known, the approximate first cost of any contemplated arrangement may be obtained.

TABLE II—ANALYTICAL METHOD—INVESTMENT COSTS PER KILOWATT

Units	Investment per Substation					Investment in Distribution L.D. = 143		Distribution Investment per Kilowatt per Kilowatt		Total Investment

										6.38	8.95	12.66	17.90	25.32
										39.94	42.56	46.27	51.51	58.92
										6.85	9.68	13.70	19.36	27.40
										37.85	40.68	44.70	50.36	58.40

Use of First Method—Assuming that a study is to be made of a district serving a demand load of 6,000 kw. from a load density of 160 kw. per 1,000,000 sq.ft., and that Table I is applicable to the case in point, it is evident that there are combinations to be considered, neglecting those combinations requiring the use of more than one kind of unit. These combinations are set forth in Table III.

The first and second plans show the greatest economy, but as only two units are required to feed the total load in either case, continuity of service would be jeopardized if either the first or second plan was adopted. Plan No. 9 involves the use of three-unit stations, and would undoubtedly be eliminated. Plan No. 8 would probably also be eliminated on account of its relatively high cost.

This leaves Plans Nos. 3 to 7, inclusive, for consideration. The maximum difference in annual cost is \$1.41 per kilowatt of capacity, making a total for the 6,000 kw. area, of \$8,460. Quite a range as to number of stations is provided, the range being from one to six stations. Single-, double- and triple-unit stations remain in the list, although the triple-unit stations (Plan No. 5) would probably be eliminated for practical reasons. The use of four machines would tend to insure reasonable reliability of service, and it will be noted that Plan No. 4, four single-unit stations with 1,500-kw. rotaries, has a comparatively low annual cost.

Having eliminated, for the reasons given, five of the plans, the engineer would proceed to make a detailed study of each of the remaining plans. These studies would include in each case the tentative selection of sites, the laying out in detail of complete distribution and transmission systems, and the computation of fixed charges and power loss costs on the basis of the revised layout.

Having brought this economic study to a conclusion, the engineer would next consider certain practical points which might affect the ultimate selection from an operating standpoint. Among such points might be mentioned: (a) Desirability of two-unit as compared with single unit-stations; (b) desirability of the use of a certain size and type of unit; (c) availability of substation sites; (d) availability of underground conduit for transmission cable; (e) the importance of electrolysis mitigation.

Second Method—The difference between the second method—which might be termed a practical (as distinguished from an analytical) method—and the first method, is, briefly stated, that under the first method consideration is given to practically all possible sizes and combinations of units in the preliminary analytical study, whereas under the second method the tentative selection of one or two sizes at once eliminates others from the preliminary study.

The second method readily lends itself to the study of small areas or areas of varying load density. The engineer in many cases is confronted with the problem of relieving an existing station of overload by the installation of an automatic station at some point in the district served by the existing station. Under these circumstances the size and general location of the new station are fixed by conditions, and an abbreviated type of study along the lines of the second method is all that is necessary.

The method, as set out below, follows what has been rather general practice in such studies, and the committee has simply endeavored to set down in concrete form the cardinal points of such a method. By its very nature, the method is a flexible one and permits of variation (as dictated by local conditions) as the study progresses.

Outline of Second Method—1. Prepare a complete table of the costs, load constants, etc., entering into the calculation.

2. Prepare a car spot diagram (say on a maximum half-hour basis) for the area to be served and divide into feeder sections of sizes determined by load density, traffic conditions and other practical considerations. Determine the load and center of load for each section, checking the former, where possible, by ammeter readings at existing stations.

3. If the size of the general area under consideration warrants, divide the entire area into two or three districts, i.e., heavy-, medium- and light-load districts, as determined by the load density in various sections.

4. Assume, tentatively, a size of unit best fitted, from a practical standpoint, for the particular district under consideration and by the center of load method fix the theoretical location of each unit.

5. On the basis of the locations as determined, lay out the distribution system, designing the various feeders with regard to load to be carried, voltage drop, equalizing capacity between stations, etc., and using commercial sizes of wire.

6. Design the transmission system, basing calculations upon capacity required for normal service and making proper allowance for continuity of service in case of cable failure.

7. On the basis of the calculations outlined above, draw up a table showing the first costs and annual costs of the various layouts.

8. Up to this point the calculations have been based on one size of unit (for each district), arranged in single-unit and perhaps two-unit stations. The results derived may indicate the advisability of assuming a second size and making additional layouts on this basis.

9. Having brought the study to this point economic comparisons for a number of combinations are available. Further consideration must then be given to the practical merits of the various plans.

Specific Examples—It will be evident to those who have made such studies that the working out in detail of a specific example involving a large area is quite a task. Time did not permit of the application of the first method to a specific study, although it is believed that sufficient explanation has been given to make the method clear. A specific example showing the use of the second method, however, was worked out in detail.

The Economic Limits to Which Track Drops Can Be Reduced—Assuming that the track bonds are in good condition there are three principal methods of reducing track potential gradients: first, by installing cable in parallel with the rail; second, by an insulated return system and third, by increasing the stations feeding a given area.

The first two methods require the use of additional copper cable. It is evident that if the current flow in such cable is below the economic value, the use of the wire, while perhaps advisable from the standpoint of reduction of rail gradients, cannot be justified from a purely economic point of view.

Based on the data used in the specific cases included in the report, the peak load value of current for a 1,000,000 circ.mil cable which gives the greatest economy (balancing fixed charges against power losses) is 600 to 700 amp. Such a current will produce a drop of 6 or 7 volts per 1,000 ft. of cable.

If we assume a double track line with four rails, each equal to 1,000 000 circ.mil of copper wire, and having a potential gradient of $7\frac{1}{2}$ volts per 1,000 ft., it is apparent that the installation of one 1,000,000 circ.mil cable in parallel with the rails will reduce the gradient to 6 volts, which is equivalent to a flow of 600 amp. in the cable. This result leads to the conclusion that where track gradients are below the figure assumed, the installation of parallel copper is not justifiable from an economic standpoint.

If the negative feeders in an insulated return system are designed to carry approximately 600 or 700 amp. (maximum) per 1,000,000 circ.mil, the negative drop to the bus will be higher than in the case of an uninsulated system and the negative power loss, therefore, greater. The potential gradients which ordinarily obtain on uninsulated systems are of such value that any reduction by means of an insulated return system can only be made at a financial sacrifice.

As to the third method, namely an increased number of stations, the committee is of the opinion that any layout of substations, which is justified from an economic standpoint, would result in track gradients of such value as practically to eliminate danger from electrolysis.

The matter might be summed up as follows:

As a general thing, the reduction of track gradients by the use of parallel feeders or an insulated return system can only be accomplished at the sacrifice of economy. The use of automatic stations, due to the increased number which can be justified, will reduce track gradients to values which from an electrolysis standpoint are safe.

An increase in the number of distribution centers in heavily congested districts with attendant increase in trolley voltage, has, in one or two specific instances, resulted in an increase in demand load and energy consumption. This is due to the fact that whereas an increase in the number of stations reduces feeder losses, the increased voltage results in higher rheostatic losses at the car which may more than offset the saving in feeder losses.

In districts where the distance between stops is relatively long and vehicular traffic light, considerable free running is possible and the benefits of high voltage can be realized. This is not the case, however, in congested districts, where schedule speeds are dependent very largely upon general traffic conditions.

Data obtained under actual service conditions indicate that the schedule speeds possible in heavily congested districts can be obtained with a trolley voltage materially lower (150 to 200 volts) than the general or system voltage. It is evident, however, that satisfactory operating conditions, at street intersections for instance, require more than 400 or 450 volts.

Tests taken under service conditions also indicate that for congested districts, voltages between 400 and 500 result in the greatest power economy, due to the low rheostatic losses. These tests bear out the statement that increased voltage increases power costs.

INTERCONNECTION OF STATIONS COMMON

It is general practice to interconnect adjacent stations through tie feeders, and the difference in bus voltage at the various stations under such conditions is limited by the feeder design, particularly where compound-wound converters are used. The use of shunt-wound converters, however, provides a very satisfactory means of regulating the voltage, for at times of heavy load the voltage is automatically lowered, while at times of light load (when traffic is lighter and advantage can be taken of high voltage) the voltage is reduced comparatively little.

It is impossible to name a figure which will satisfy all elements of the problem under various conditions. A voltage of from 500 to 550, however, seems sufficiently high to satisfy service requirements, although due to interconnection of stations a bus voltage much below 550 volts (based on a general system voltage of 600 volts) could hardly be obtained. The committee simply wishes to call attention to the fact, first, that comparatively low volt-

ages are possible in heavily congested districts without impairment of service, and second, that increase of voltage in such districts, although of no benefit, will result in increased costs of power, particularly demand charge.

The report was signed by C. A. Butcher, J. M. Drabbelle, C. H. Jones, F. W. Peters, E. H. Scofield, L. D. Bale, and W. E. Bryan, chairman.

TABLE III—COMPARISON OF VARIOUS COMBINATIONS TO SUPPLY A DISTRICT WITH A DEMAND LOAD OF 6,000 KW. AND A DENSITY OF 160 KW. PER 1,000,000 SQUARE FEET.

Plan	No. of Stations	No. of Units per Station	Total No. of Units	Capacity of Units, Kw.	Total Cost per Kw. of Capacity
1	2	1	2	3,000	\$9.10
2	1	2	2	3,000	9.67
3	3	1	3	2,000	10.32
4	4	1	4	1,500	10.93
5	1	3	3	2,000	11.15
6	2	2	4	1,500	11.35
7	6	1	6	1,000	11.73
8	3	2	6	1,000	11.96
9	2	3	6	1,000	12.20

In the discussion following the presentation of this report Adrian Hughes, Jr., superintendent of power United Railways & Electric Company, Baltimore, Md., told of the studies which were being made in Baltimore in regard to the use of automatic substations. He brought out the fact that local conditions govern the solution of the problem, and he suggested that the work of the committee on automatic substations be continued.

A written discussion by R. L. Weber, electrical engineer Kansas City Railways, was read by G. C. Hecker, special engineer of the American Electric Railway Association. This discussion described an analysis of substation requirements and location as carried out in Kansas City and results of a study that had been made.

Ralph H. Rice of the Board of Supervising Engineers, Chicago, Ill., presented several curves showing costs of substations as the number is increased. He also presented data he had worked out to show how the distribution costs vary with the number of substations. These figures were obtained by applying the methods recommended by the committee on automatic substations and included in the report.

D. D. Ewing, professor of electric railway engineering Purdue University, said that the fundamental basis of the power problem should be kept clearly in mind in arriving at any particular conclusions, and that various theoretical methods used would be influenced largely by fundamental considerations.

M. B. Rosevear, superintendent of distribution Public Service Railway of New Jersey, said that to him the outstanding feature of this committee's report, and, in fact, of previous reports of other committees dealing with this subject, was the great economy that resulted from the use of automatic substations and the increased advantages that accrued from their use.

The report of the committee on automatic substations was accepted with a vote of appreciation for the work done and for the additional points that had been brought out in the discussion. The meeting then adjourned.

Thursday's Session A. E. R. E. A.

The report of the committee on power distribution was abstracted by M. B. Rosevear, chairman, except for subjects 1, 2, 4 and 8, which were abstracted by sub-committee chairmen. Subject No. 1 was abstracted by Charles H. Jones, electrical engineer Metropolitan West Side Elevated Railway, Chicago, Ill.; subjects 2 and 4 by H. S. Murphy, assistant electrical engineer Philadelphia Rapid Transit Company, and subject 8 by Adrian Hughes, Jr., superintendent of power United Railways & Electric Company, Baltimore, Md. Each subject was represented separately and discussed before proceeding to the following subject.

Power Distribution

The report of the committee on power distribution is divided into five principal subjects, dealing with catenary overhead construction, trolley wire specifications, pole reclamation, specifications for low conductivity trolley wire, industrious co-ordination, temporary connections to trolley wire, overhead construction for trackless trolleys, and review of existing standards. A list of power distribution matters which are being considered by other special committees and by sectional and technical committees under the auspices of the A. E. S. C. is also included.

The committee recommends that subjects assigned for 1924, in addition to those which should be continued, are concrete poles, return circuits, including bonding, standard approach ears or flexible tips, at least the ruling dimensions, standardize various types of suspensions, particularly the ruling dimensions.

Specification for Catenary Overhead Construction.—The sub-committee has prepared a detailed specification for catenary overhead construction, other than for steam railroad electrification. This specification deals primarily with the trolley wire and its supporting catenary system. The various paragraphs cover the supporting system, car clearances, trolley height, spacing of poles and pullovers, with accompanying diagrams and tabulations. The method of locating trolley wire on curves is given, with tables and graphic charts from which may be readily computed the offset required for various conditions as to trolley height, super-elevation and curvature of track, height of car and length of pole. Other graphic charts are included giving the relation between sag and tension in loaded and unloaded messengers for pole spacings from 150 to 300 ft. for steel messenger and for 300 ft. spacing for copper messenger. Temperature correction charts are included in every instance. The method of using all curves is completely explained in the text.

The specifications also include sag-tension curves for trolley wire under similarly varying conditions and cover auxiliary contact wires, hangers, steady strains, anchors and feed taps.

It is recommended that the specification be approved as a miscellaneous method and practice, and that the committee for next year be instructed to put the specification in final form for submission as a recommended specification to the 1924 convention.

It is also recommended that the 1924 committee be instructed to prepare specifications for catenary suspension materials.

Trolley Wire Composition and Wear. Specifications for Round and Grooved Hard-Drawn Copper Trolley Wire.—The sub-committee has compiled data relative to trolley breaks from information submitted by twelve companies, well distributed geographically. These data cover 3,300 trolley breaks, for 5,300 miles of overhead line, over a maximum period of two years. Three tabulations are included: (1) Trolley breaks per mile of single track, (2) analysis of causes of trolley wire failures, (3) summary of causes of trolley wire failures.

These are followed by quoted recommendations of distribution engineers from widely separated geographical locations as to methods of reducing the number of failures.

There is a discussion of the need of securing further data, particularly of a quantitative nature, and a broad research program is proposed, including:

1. The preparation of detailed information by distribution engineers of member companies.

2. The writing of a detailed history of at least one complete section of trolley wire by co-operating member companies.

3. Co-operation with committee on welded rail joints using proposed rotary service testing machine to make comparative tests on various kinds of trolley wire, fittings and collector devices.

4. Employment of a research engineer, or founding a research fellowship at some university, to study the manufacture and use of trolley wire, with such laboratory work as necessary.

As a result of joint action with the American Society for Testing Materials, a revised specification for hard-drawn copper trolley wire is presented.

It is recommended that: (1) The study of trolley wire wear be continued, including causes of wear and failure. (2) The proposed research program be approved and undertaken. (3) The revision of specification Dw 3b, for round and grooved, hard-drawn copper trolley wire be approved. (4) Appropriate action be taken, so that the revised trolley wire specification may be presented to the American Engineering Standards Committee for approval, if possible, as an American standard. The American Society for Testing Materials to be invited to join with our association in presenting the matter to the A. E. S. C.

Pole Reclamation.—Reference is made to the report of the committee on wood preservation, particularly that

portion relative to treatment of wood poles after erection.

It is recommended that further study of pole reclamation be dropped for the present.

Specifications for High Strength, Low Conductivity, Trolley Wire.—Reference is made to a study of existing specifications and discussion with the American Society for Testing Materials sub-committee.

Certain tentative values for tensile strengths and twist tests of high-strength trolley wire are submitted, in order to promote discussion.

It is recommended that the A. E. R. E. A. join the A. S. T. M. in requesting the appointment of a sectional committee under the auspices of the A. E. S. C. to prepare an American standard specification for high-strength trolley wire.

Inductive Co-ordination.—The sub-committee has studied and discussed this subject, including certain data jointly promulgated by the National Electric Light Association and the Associated Bell Telephone Companies. Certain information has been gathered from member companies and an additional questionnaire prepared for use by their representatives if and whenever an American committee is formed by various interested national bodies. If the American committee is formed the sub-committee can render such assistance to its representatives as necessary.

It is recommended that the study of inductive co-ordination be continued. If no American committee is formed, it is recommended that the committee on power distribution be authorized to co-operate with proper committees of other national bodies.

Temporary Connections to Trolley Wire.—Data have been collected as to various devices now in use for temporary connections to trolley wire, particularly for welders and other apparatus drawing heavy currents.

The sub-committee describes and illustrates several typical devices which it is believed prevent damage to the trolley wire if properly used.

It is recommended that the subject be continued for another year.

Overhead Construction for Trackless Trolley.—The sub-committee presents information relative to overhead construction for trackless trolley, together with typical illustrations.

It is recommended that the subject be continued for another year.

Review of Existing Standards.—The committee submits a detailed discussion of each section of the manual under the heading "Power Distribution." In the main, no changes are suggested, but the following recommendations are made:

Df 2b—Specification for galvanizing or sherardizing on iron and steel. This should be included in the new manual with an explanatory note that it has been referred to the A. E. S. C.; that some objections to the present specification have been raised; and that it would probably be revised to some extent by a sectional committee before being approved.

Ds 2c—Specification for 600-volt di-

rect-current overhead trolley construction. In the new Manual there should be added an introductory paragraph referring to other specifications for materials such as Df 4d, overhead line materials; Ds 3c, selection of poles; etc.

Dw 1c—Standard grooved trolley wire sections. This section should be withdrawn from the manual when the revision of specification Dw 3b for round and grooved, hard-drawn, copper trolley wire is approved.

Block Signal Specifications.—The committee discusses the need of referring signal matters to some specific committee. It has reviewed existing signal specifications and submits its recommendations on account of the pending republication of the manual.

It is recommended that:

1. The question of assigning block signal matters to either the committee on power distribution or to a special committee be referred to the executive committee for decision.

2. The following sections be withdrawn from the Manual because of changes in the art and pending action by a committee during 1924:

Ss 7b—Use of continuous track circuits for the control of automatic signals for high speed interurban service.

Ss 8a—Methods of signaling single-track suburban railways for headway between 5 and 20 minutes and speed not exceeding 20 m.p.h.

Ss 9a—Methods of signaling double-track suburban railways for headway between 1 and 10 minutes and speed not exceeding 30 m.p.h.

Ss 10a—Methods for signaling single-track interurban railways for headway not less than one hour and speed 40 to 60 m.p.h.

Ss 11a—Methods for signaling single-track interurban railways for headway as frequent as 15 minutes for trains in several sections and speed 40 to 60 m.p.h.

Ss 12a—Methods for signaling double-track interurban railways for headway as frequent as 5 minutes and speed 40 to 60 m.p.h.

Ss 13a—Sizes of lenses for use in light signals.

3. The other signal sections in the manual be carefully reviewed during 1924.

The report was signed by J. Walter Allen, Robert L. Allen, S. H. Anderson, L. W. Birch, H. G. Burd, Leslie E. Delf, Ralph W. Eaton, D. D. Ewing, L. F. Griffith, C. L. Hancock, H. D. Hawks, C. J. Hixson, Adrian Hughes, Jr., Charles H. Jones, John Leisenring, F. McVittie, H. S. Murphy, H. A. Pharo, W. Schaaake, A. Schlesinger, James Scott, F. J. White, Charles R. Harte, sponsor, and M. B. Rosevear, chairman.

A written discussion of subject 1 by O. M. Jorstad of the Westinghouse Electric & Manufacturing Company was read by Mr. Rosevear. Several corrections in the printed report were called to the attention of the association, on pages 34, 35 and 51. These corrections were accepted by the convention and will be changed in the final report.

Subject No. 2 on trolley wire composition and wear was discussed by J. F. Neild of the Toronto Transportation Commission, who gave some results that have been accomplished in Toronto by following the recommendations contained in the committee's report. Mr. Neild said that the recommendations should be backed up by all operating companies and followed closely.

The subject of overhead construction for trackless trolley was discussed by J. F. Neild of the Toronto Transportation Commission, Adrian Hughes, Jr., superintendent of power, United Railways & Electric Company of Baltimore, Md., and H. S. Murphy, assistant electrical engineer Philadelphia Rapid Transit Company. Mr. Neild told of some of the difficulties they had in Toronto with overhead construction, while operating trackless trolleys, and changes that were made to overcome them. They use a 30-in. spacing of trolley wire and use standard line material in Toronto. He felt that subsequent committees should make recommendations for a standard spacing to be adopted by the association. Mr. Murphy said that they use a 24-in. spacing in Philadelphia and use standard line material. Mr. Hughes said they use a 24-in. spacing of trolley wires for trackless trolley operation in Baltimore and use standard line material. Both felt that a standard spacing was desirable.

C. R. Harte, construction engineer the Connecticut Company, gave an outline of the work which was being undertaken by the American Engineering Standards Committee on galvanizing and sherardizing and assured the members that this work was being considered very carefully.

The report of the committee on power distribution together with recommendations of the standards committee was received and approved by the association.

The report of the committee on power generation was abstracted in part by Chairman C. A. Greenidge, chief engineer, the J. G. White Management Corporation, New York, except the report of sub-committee No. 3, which was presented by L. D. Bale, superintendent substations, Cleveland Railway. An abstract of the report follows:

Power Generation

The first subject dealt with by the committee was recommendations regarding the A.S.M.E. boiler code. Tentative specifications of the A.S.T.M. for lap-welded and seamless steel and lap-welded iron boiler tubes were reviewed.

A second sub-committee reviewed recent progress in the design, application and operation of stokers, grates and furnaces. It is stated that this has been more an extension and refinement of previous developments than the application of any startlingly new principles. Demand has required improvements in the class of workmanship. Simplification and increased ruggedness of design through the entire redesign of some existing types have been found desirable in order better to meet those demands and the increased size of single units now desired.

The sub-committee on auxiliary equipment drive gave a brief comparison of electric and steam-driven auxiliaries. Coal and ash-handling and piping were considered by another sub-committee. The report on these

subjects consists principally of a bibliography covering recent technical articles.

The greater part of the report is taken up with a review of current practice in automatic substation design and operation. This subject does not include the economic aspects of the automatic station, but is intended for the purpose of presenting an analysis of good current practices for the guidance of those who are interested in automatic substation operation.

Four general classifications were used in gathering and compiling data, as follows: Urban; steam railroad electrification; heavy duty interurban; suburban or interurban. Questionnaires were forwarded to electric railway systems operating 118 automatic substations. Answers to some forty-three questions were received from companies operating ninety-five automatic stations. These questions cover a wide range of design and operation.

A list of all companies operating automatic substations, together with the rating and type of service, is also included.

The sub-committee in presenting this report, much of which is in the form of tabulated statistics, states that it realizes that there are several very important phases of the subject that should be further investigated and given more prominence than was possible in the preparation of a report of this kind, which was only intended to cover the subject in general. Many of the individual aspects of the matter, which have been covered by the committee in this report, need not receive further consideration by engineering committees, at least until a further advance in the art is noted. There are, however, several questions, principal among which is the matter of ventilation, which should receive immediate attention. The committee recommended that the matter of automatic substation ventilation for plants in all classes of railway service be a subject for consideration by committees during the coming year.

The report was signed by L. D. Bale, W. E. Bryan, H. E. Davis, F. G. Frost, F. C. Hanker, G. H. Kelsay, H. A. Kidder, F. W. Peters, G. W. Saathoff, W. C. Slade, A. E. Stierly, R. L. Weber, G. W. Welsh, E. H. Scofield, sponsor, and C. A. Greenidge, chairman.

W. E. Bryan, superintendent of power United Railways of St. Louis, suggested that the report of sub-committee No. 3, recommending further study on the subject of ventilation, be given careful consideration and be included in the instructions to next year's committee.

The report of the committee on power generation was accepted. The report of the committee on standards, Martin Schreiber, chairman, which was acted upon in detail after the report of each committee during the convention was also accepted as a whole. In general the recommendations were approved, but in a few instances the standards

committee did not agree. The standards which were disapproved by the standards committee follow:

Standards

Power Generation—A proposed definition of "generator output" was submitted for approval. The committee on standards voted that it would approve the definition only in the event that it had the approval of the American Institute of Electrical Engineers and similar organizations concerned with standard definitions of this character. It was further voted that there was no apparent need of this in a Manual section.

Wheel and Rail Contours—The committee passed the following resolution relative to the dimensions for steel wheels, Appendix B of the report:

"If the convention approves the new wheel contours (recommendation No. 1) this will necessarily involve the revision of certain existing tables of wheel dimensions in Manual section Et 7b as well as the revision of Manual sections Et 18a, Sm 3a and Ws 2a. The committee on standards desires at the same time to recommend to the executive committee that consideration be given to the possible expansion of the tables of dimensions (Manual section Et 7b) to permit obtaining standard flanges and treads in the standard diameters shown in Table 1."

Building and Structures—The committee on standards disapproved a recommendation that the report on prepayment and postpayment enclosures, with drawings 16 to 23 inclusive, be published in the Manual as miscellaneous methods and practices.

Way Matters—The committee on standards disapproved a recommendation that the title of Wr 1c be revised to read "plain girder and standard section rails," and suggested that the title read simply, "plain girder rails."

Equipment—Et 9b—Certain revisions to make this specification conform with A. S. T. M. specification, serial designation A-19-21 were referred back to the equipment committee to clarify an apparent conflict between proposed sections 301a and 301b.

Et 14b and Et 15b—Certain revisions were referred back to the committee on equipment for a reconsideration of proposed section 403a dealing with gear bores.

Et 22a—The proposal to omit section 111 dealing with permissible variations, since it is recommended that it be included in Manual section Et 3c, was disapproved, it being believed advisable to have this information in both specifications Et 3c and Et 22a.

B. J. Yungbluth, supervisor purchasing and supplies Philadelphia Rapid Transit Company, presented the report of the committee on purchases and stores which had been read on Wednesday to a session of purchasing agents and storekeepers for approval by the Engineering Association and inclusion in the Manual as recommended practice. This report was approved by the engineering association with the understanding that it would be submitted

to the committee on standards for approval.

Purchases and Stores

Two subjects were assigned to this committee: (1) Review the classification of materials recommended in the Accountants-Engineering "joint report on stores accounting" and revise if necessary. (2) Continue the study of uniform method of taking periodical inventory with a view of the adoption of standard forms.

1. **Standard Classification of Materials and Supplies for Electric Railways**—A joint report was made on this subject by the committees on stores accounting and purchases and stores in 1921, but through a misunderstanding it was not formally acted upon by the Engineering Association. This committee, in joint session with the stores accounting committee, gave this matter further consideration and agrees with the conclusions contained in the Accountants-Engineering joint report on stores accounting, 1921, that in view of the vast sums of money tied up in inventories it is necessary to have a classification to provide a uniform and economic method of controlling the investment and to secure the advantages of a logical, physical grouping of materials and supplies for proper ordering, storing, handling, distributing, inventorying and recording. Such a classification has nothing in common with that of operating expense accounts.

It was recommended, however, that a classification of materials and supplies containing seventy-four subdivisions [published with the report of the committee on stores accounting of the Accountants' Association] be substituted for the one recommended in the 1921 report, which contained fifty-nine subdivisions. The former has been in successful use for several years and has met the test of practicability, while the latter has not yet been adopted by any company. The classification with seventy-four subdivisions, it was concluded, was more comprehensive and would more nearly meet the necessities of the larger companies, while smaller companies not requiring such detail may abridge it by making a selection of the classes meeting their requirements or consolidate them.

A monthly statement showing the operation in materials and supplies according to this classification is again urgently recommended. The form submitted in the Accountants-Engineering joint report on stores accounting, 1921, showing the revised classification is sufficiently comprehensive to meet the necessities of any company; although some companies will not require the information in such detail, they can readily consolidate certain columns and eliminate others in accordance with their necessities.

2. **Stock Books**—Before the committee could reasonably consider a method for taking fiscal inventories it was necessary to determine the basic system for stock control. The Accountants-Engineering joint report on stores

accounting, 1921, recommended for the control of materials and supplies the stock book system either in lieu of the more customary form of stock card or stock ledger sheet, or in addition thereto and in conjunction therewith.

3. **Fiscal Inventories**—The purchases and stores and stores accounting committees in joint session unanimously approved the following recommendations for taking fiscal inventories of materials and supplies:

1. A general fiscal inventory of materials and supplies as designated by the accounting department for each property shall be taken annually as of one date; the date shall be agreed upon by the accounting department and the stores department.

2. The fiscal inventory shall be taken by the stores department in conjunction with and under the supervision of the accounting department, to assure its being satisfactory for fiscal purposes.

3. The quantities on hand at the time of the annual inventory shall be entered in the stock books in the "On Hand" column for the current month.

4. The form in which the list of material on the inventory will be supplied to the accounting department, and the method of pricing and extending the inventory will depend upon the practice of the various individual companies, as in some cases the accounting is done by the stores department and in others by the accounting department.

4. **Comparative Ratios—Investment in Materials and Supplies on Hand to Gross Earnings**—Realizing that the stock of materials and supplies on hand involves such a large investment, the committee sought to determine a gage by which to measure the performance of the various companies.

The ratio of materials and supplies on hand at the end of the year to gross earnings for the year was taken as a most practicable base for a comparison.

Questionnaires were sent to twenty-four companies for such information for the years 1920, 1921 and 1922; replies were received from thirteen, which show that all companies made successive reductions in the ratio for each year, and that each company maintained about the same relative rank. Taking the year 1922, the four companies having the lowest ratio show an average of 3.08; the second group of four companies showing the next lowest ratio averaged 5.64; the remaining five companies show an average of 7.34; while the ratio of all companies averaged 5.35.

5. **Sessions for Purchasing Agents and Storekeepers**—The committee recommended that such a session be held at the annual conventions.

6. **Subjects for Next Year**—The following subjects are recommended for consideration by the purchases and stores committee for the year 1924:

Method of classification and sale of scrap materials to increase the revenue therefrom.

The proper place for the purchasing and stores departments in the company's organization.

The report was signed by William C. Bell, Jackson P. Dick, J. F. Fleming, Walter N. Ford, C. A. Harris, Harry H. Lloyd, W. S. Stackpole, W. H. Staub, and B. J. Yungbluth, chairman.

Resolutions

C. R. Harte, in the absence of H. H. Norris, read the report of the committee on resolutions, which was accepted. The resolutions follow in part:

"Our officers, through painstaking and untiring effort, have laid the foundation which has made possible the successful outcome of this convention.

"The remarks of President Emmons to the effect that it is the duty of railway men to furnish the transportation facilities that the people need, indicate the wisdom of a farsighted policy in the matter of bus operation. The excellence of the bus exhibits and the evident interest therein have vindicated the policy of encouraging the manufacturers to adapt their equipment to mass transportation needs.

"The reports of committees were distributed well in advance of the meeting, giving opportunity for study prior thereto. This resulted in pointed discussion of the salient features of the reports.

"The sponsor system is to be credited with a considerable share of the success of this meeting, as it has provided a means for the officers to keep in close touch with the progress of committee effort.

"The increasing tendency to co-operate with other associations, particularly along lines of research, is commendable.

"The increasing interest in the standing committee on purchases and stores shows the wisdom of the establishment of this committee under the auspices of the Engineering Association.

"The exhibits have been well worked out with a view to showing the progress which has been made since the last exhibits of two years ago."

The report was signed by R. C. Cram, C. R. Harte and H. H. Norris, chairman.

The committee on nomination submitted the following names for officers and members of the executive committee during the ensuing year and these men were elected by unanimous vote:

President, H. A. Johnson, assistant to the general manager Metropolitan West Side Elevated Railway, Chicago.

First vice-president, C. H. Clark, engineer maintenance of way Cleveland Railway.

Second vice-president, R. C. Cram, engineer surface roadway Brooklyn-Manhattan Transit Corporation.

Third vice-president, Charles R. Harte, construction engineer the Connecticut Company, New Haven, Conn.

Executive committee: Daniel Durie, general superintendent West Penn Railways, Connellsville, Pa.; R. H. Dalgleish, chief engineer Capital Traction Company, Washington, D. C.; E. H. Schofield, engineer power and equip-

ment, Twin City Rapid Transit Company, Minneapolis, Minn.; M. B. Rosevear, superintendent of distribution Public Service Railway, Newark, N. J.

H. H. Adams and Martin Schreiber, past-presidents of the association, were named by retiring President Datz as a committee to escort the newly-elected officers and members of the executive committee for their installation. Before speaking of the newly-elected officers, Mr. Adams called attention to the creditable results accomplished during the past year under the leadership of President Datz. In presenting H. A. Johnson, the new president, he expressed confidence in the latter's ability to carry on the high standard of work set during the last year.

Mr. Johnson, in expressing his appreciation of the honor bestowed upon him by the association, called attention to the necessity for continued co-operation by the entire membership. He then presented the past-president's badge to Mr. Datz.

Each of the officers and members of the executive committee pledged himself to support actively the program for the ensuing year.

Mr. Harte called attention to the importance of closely studying the field for bus operation. No expressed confidence in the ability of the railway to carry on most efficiently mass transportation, but stated that the bus and car should be combined wherever necessary to give the best transportation.

James Dalrymple, general manager Glasgow Corporation Tramways, Glasgow, Scotland, addressed the association, outlining briefly the practice of

his company. He also called attention to the serious unemployment situation which now exists in Glasgow.

Retiring President Datz moved a vote of thanks to Secretary J. W. Welsh and Special Engineer Guy C. Hecker for the effective work which they have carried out during the past year. He also moved a vote of thanks to the manufacturers for the splendid exhibits. Both were unanimously adopted.

New Officers of the Claims Association

The officers elected at the session of Oct. 10 to head the Claims Association for the ensuing year are as follows:

President, W. H. Hyland, claim agent Fonda, Johnstown & Gloversville Railroad, Gloversville, N. J.

First vice-president, H. D. Briggs, assistant general claim agent Public Service Railway, Newark, N. J.

Second vice-president, J. H. Handlon, claim agent Market Street Railway, San Francisco, Cal.

Third vice-president, C. B. Proctor, claim agent Memphis Railway and Memphis Power Company.

The executive committee consists of the officers and S. J. Herrell, claim agent Knoxville Power & Light Company; J. S. Kubu, assistant superintendent accident department Cleveland Railway; L. F. Wynne, general claim agent Georgia Railway & Power Company, Atlanta.

Convention secretary, E. L. Lindemuth, claim agent Wilkes-Barre Railway.

Card Parties and Dances Feature the Entertainment Program

AFTER the business of the day was done for the delegates, excellent entertainment was furnished in the evenings. On Sunday a delightful sacred concert was given before a large audience at the Marlborough-Blenheim, and on the following evenings there were dances, a carnival, and a swimming exhibition. During the daytime there were card parties for the ladies and a golf tournament.

Shortly after nine o'clock Monday evening the orchestra on the Pier broke into the strains of the "Star Spangled Banner," and at the conclusion, swung into a lively dance tune for the opening ball. Led by President and Mrs. Emmons, the crowd poured out onto the dance floor and the festivities began. The music was furnished by Paul Whiteman's Orchestra from New York and was much enjoyed by everyone present. At midnight the formal dancing at the Pier ended, but many of the dancers proceeded to the Hotel Traymore, where dancing continued until 2 o'clock.

The carnival on Tuesday evening was a huge success. Due to the careful preparations made by E. F. Wickwire of the Ohio Brass Company, there was

something doing every minute. Professional and amateur entertainment was furnished, and in between these features there was general dancing. The regular lighting arrangements on the Pier had been supplanted by special lights installed expressly for the occasion by L. W. Mackall of the Crouse-Hinds Company, making the appearance of the Pier one of rare beauty. Fancy paper hats were furnished the guests as they entered the hall, and together with the gay costumes of the performers in the carnival, lent color to the scene.

More than a hundred of the ladies enjoyed a card party at Haddon Hall on Tuesday afternoon, which was more than double the number that have played at previous conventions. On Wednesday the ladies again played cards, this time at the Traymore.

The golf tournament was held on Sunday at the Northfield Country Club. As told in the CONVENTION DAILY, the attendance was as large as the scores were low.

Altogether, the entertainment committee, by providing amusement for every occasion, earned the thanks of all the delegates attending the convention.

The News of the Industry

I. C. C. Denies Application

Decision Says Western Pacific Seeks Sacramento Northern Lines for System Purposes

The Interstate Commerce Commission handed down a decision recently denying the application of the Western Pacific Railroad, a steam property, to acquire control of the Sacramento Northern Railway and to purchase the bonds of the Sacramento Northern Railroad. A similar application was denied by the commission on May 18, 1922, on the ground that the Sacramento Northern Railway was required to apply to the commission for authority to issue its stock and assume certain obligations and liabilities with respect to the securities of the Sacramento Northern Railroad. After the applicant had applied for a rehearing, which was held on Aug. 24, the case was orally argued before the commission on Dec. 6, 1922. It was the former record, supplemented by additional evidence, which the commission considered before handing down its latest findings. The matter was referred to in the *ELECTRIC RAILWAY JOURNAL*, issue of Dec. 23, 1922.

The Sacramento Northern lines are now owned and operated by the Sacramento Northern Railroad. It was proposed that this company sell all of its property to the Sacramento Northern Railway, subject to existing indebtedness, including \$5,224,373 principal amount of bonds of the old company, payment on which will be assumed by the new. The new company intended to provide itself with funds to complete the purchase, and with an additional amount of working capital, through the issue and sale, at par, of \$1,000,000 of its capital stock.

The Western Pacific Railroad took the attitude that the Sacramento Northern Railroad was an interurban electric railway and that the Sacramento Northern Railway would have the same status. It was the plea of that company that neither the railroad nor the railway was subject to the jurisdiction of the commission and that the denial of the application on the part of the commission was wrong.

The commission says that even if it is allowed that the commission is without jurisdiction over corporations organized for the purpose of operating independently as interurban electric railways, the new Sacramento Company does not fall within the "except a street, suburban or interurban electric railway which is not operated as a part of a general steam railroad system of transportation."

The commission says further that there are signs that such operations will be of a broader character than those ordinarily performed by an "interurban electric railway." The Interstate Commerce Commission in its findings then lists seven indications which point to a character of business being conducted by the company more comprehensive than that ordinarily performed by an interurban electric railway.

On the other hand, the Western Pacific Railroad advanced seven arguments to show that the company would be operated as an electric interurban railway. The commission said that there was a basis for the conclusion that the carrier was more than an interurban electric railway if in addition to the business of this character it performed functions which are not commonly interurban functions and, further, was empowered by its charter to engage in transportation generally. The commission says that even if it were able to find that the new company will be operated as a "street, suburban or interurban electric railway," there would still remain the question whether or not it would be operated "as a part of a general steam railroad system of transportation."

The commission could not escape the conclusion that the Sacramento Northern would be operated as part of the Western Pacific system. Further, the commission said that other statements made by the Western Pacific all went to prove that the proposed acquisition was for system purposes, and that the lines, if acquired, would thereafter be operated as part of the Western Pacific System, which is a general steam railroad system of transportation.

For these reasons the commission said that the new company would have to apply to it for authority to issue its stock and assume the proposed obligations with respect to the securities of the old company, and until such application was made, the commission would be unable to pass upon the merits of the proposed acquisition of control. The findings, in the original report, were therefore affirmed.

Time Extended.—An extension of two weeks has been granted by the Supreme Court to the Schenectady Railway in which to file its answering brief in the case instituted by the Public Service Commission in which the commission seeks to collect penalty for alleged violation of an order issued April 7 requiring the company to install increased equipment facilities, following investigation of crippled car service.

Another Co-operative Association in Prospect

At a recent meeting at Baton Rouge of the Louisiana and Mississippi Committee of Public Utilities Information it was decided to organize a state association along the lines of similar co-operative associations in other states. The purpose of the association will be to insure unity of action in all matters of legislation affecting the interests of the Louisiana association and other matters which will make for the advancement and welfare of the state public utilities. W. J. Aicklen, general manager of the Consumers' Light & Power Company of New Orleans, a subsidiary of the New Orleans Public Service, Inc., was elected chairman of the movement.

Personal letters outlining the motives of the proposed association have been addressed by Mr. Aicklen to the several utility corporations of the state. No unfavorable replies have been received so far. When a sufficient number of responses are in hand to warrant it, a meeting of the public utilities interested will be called and formal action taken to place the association on an enduring footing. Articles of incorporation will be filed. Subsequently a similar association will be formed of the public utilities of Mississippi.

Wage Negotiations in Progress in Springfield

Negotiations for a new wage contract are now in progress between the Springfield Street Railway, Springfield, Ohio, and its platform men, the old contract expiring Oct. 1. Both sides express belief that the new contract will be amicably negotiated. The employees are demanding a rate of 46, 48 and 50 cents an hour, the amount depending on the length of service with the company. The present scale is 42, 44 and 46 cents an hour. The company submitted a compromise proposal Oct. 5, offering 44, 46 and 48 cents an hour, retroactive to Oct. 1, but at a meeting of employees held on the same date the offer was rejected, although it was said that representatives of the union conducting the negotiations favored its acceptance.

The first move made by the company after the employees submitted their demands was to throw the company's books open to a committee of workers to show them the present status of the company's finances. It was said to be the result of this examination that the committee recommended acceptance of the company's offer.

No change in working conditions is proposed by either side.

Financial and Corporate

Will Lift Receivership

Plans Being Made for Reorganization of the Birmingham Railway—\$1,000,000 for Improvements

Plans are being perfected for lifting the Birmingham Railway, Light & Power Company, Birmingham, Ala., out of receivership and for the reorganization of the company. It is also proposed to spend more than \$1,000,000 in the betterment and improvement of the street car service.

Arrangements have been made to take up the company's \$4,601,000 of 6 per cent bonds at par and interest. The receivers have just contracted for new cars and other improvements to the amount of \$600,000, according to the agreement between the company and the city commissioners, and also hope to spend an additional \$100,000 for extensions and betterments.

Lee C. Bradley and J. S. Pevear, co-receivers, filed a petition Oct. 6 in the United States Court in Birmingham for authority to default in the payment of the interest on the 6 per cent bonds due Nov. 1.

SALE WILL INVOLVE NO EXPENSE

At the time of the filing of this petition announcement was made that a committee for the 6 per cent bondholders had been organized and had called for deposit of the bonds on or before Oct. 30. The committee announced that it holds a contract to sell the bonds deposited with the committee on or before May 1, 1924, if the principal of the bonds is due, at a price to yield to those who deposit their bonds the entire principal amount of the bonds and the interest from May 1, 1923, to the date of purchase, provided not less than 60 per cent of the outstanding 6 per cent bonds are deposited with the committee. If this sale is made it will involve no expense upon the depositing bondholders, members of the committee point out.

These bonds may be deposited with the Central Union Trust Company of New York, 80 Broadway, New York City, or with any of its agents, which will issue deposit receipts for all bonds deposited.

The petition of the receivers will be heard Oct. 30, before Judge W. I. Grubb of the United States Court of the northern division of Alabama. The petition filed shows about \$1,975,000 of maturing company and receivership obligations due between Sept. 1, 1923, and July 2, 1924; \$600,000 contracted to be spent as a direct result of the agreement with the city; \$110,000 proposed to be spent in addition, as a result of the city agreement, and about \$1,075,000 proposed to be spent during this period for improvements of the property. This shows that approximately

\$3,650,000 must be spent by the company in order that satisfactory service may be rendered. It is estimated by the receivers of the company that this program carried out through to July 2, 1924, will require almost \$1,000,000 more cash than that expected to be available in this period of time.

It is proposed by the receivers to meet this deficiency by default on the 6 per cent bond interest due Nov. 1, 1923, and extension of other obligations, if such extensions can be arranged, but it is pointed out if the deficiency is not met by the extension of other obligations, the receivership might continue indefinitely. It is also stated in the petition that if a default is made and the 6 per cent bonds are made payable in full, they are advised that prompt steps will be taken to reorganize the properties and that the payment of the 6 per cent bonds will make this possible. But such default would in no way affect the company's underlying bonds, which will become due July 2, 1924, or the company's 4½ per cent bonds, of which there are now outstanding in the hands of the public \$8,720,000.

The receivers say that in no event should there be a default in the 4½ per cent bonds, as that would require in the reorganization the raising of \$8,720,000 cash with which to pay these bonds off in full, and probably cause the payment of a much higher rate of interest on the 4½ per cent bonds in the future.

It is believed that the company will be reorganized without delay, as details of the plans of reorganization are now being worked out.

Will Determine Fare in Duluth

In the Duluth fare case recently completed in the United States District Court of Minnesota, A. L. Drum of A. L. Drum & Company, consulting and constructing engineers of Chicago and Philadelphia, testified before Hon. Thomas D. O'Brien, special master, on the value of the property of the Duluth division of the Duluth Street Railway in a hearing at Duluth.

Mr. Drum presented valuations of the property as of July 1, 1921. He summarized the physical property, including power contract, as follows: Present-day cost, prices current June, 1921, \$8,599,526; ten-year average cost, average prices 1912-1921, \$6,853,120; pre-war cost, prices current year 1915, \$5,207,626; estimated original cost, prices current date of installation, \$5,206,267.

In addition Mr. Drum submitted a report on the developmental costs to the company, which amounted to \$1,129,826, based on estimated original cost, which represents the costs that

have been, or would be, encountered in creating and developing the property to its present state of efficiency. Taking these costs into consideration and the present condition of the property, Mr. Drum testified that the going concern value of the Duluth division was at least \$800,000. Considerable additional testimony was heard as to operating costs, increased service, schedules, etc.

As a result of this hearing the rate of fare to be established in the city of Duluth and the value of the property of the company will be determined.

Discontinuance of Northern Massachusetts Property to Be Discussed

Patrons and stockholders of the Northern Massachusetts Street Railway in the territory served by the Gardner, Westminster & Fitchburg division are interested in the announcement of the Gardner Chamber of Commerce that bondholders of the road are threatening to foreclose. The Chamber of Commerce has called a special meeting to discuss the subject.

In a bulletin which the Gardner chamber has issued it is noted that I. M. Garfield, of the law firm of Garfield, Whiteside & Lamson of Boston, presents what is termed "the only concrete suggestion which comes from official source."

The letter from the attorneys representing the railway bondholders points clearly and specifically to the junking of the line unless local interests help in the crisis. It is said that if Gardner men and the citizens of the other towns which the road serves would agree to assistance there is likelihood that a reorganization of the Gardner, Westminster & Fitchburg branch would be arranged, thus permitting its continuance.

The bonds of this division can be bought at a reasonable figure, the letter says.

Gardner people have not warmed up to the suggestion and Mayor Chester P. Pearson of that city has expressed the opinion he is satisfied to have the line junked if it be the wish of those interested in the property.

"Ten years ago if the railway had been discontinued it would have been somewhat of a calamity but now Gardner's roads would be much better if the rails of the company were taken up," Mayor Pearson said.

The Mayor says he feels if the bondholders foreclose and some other interests take over the line a portion of the road could be run at a profit. The Mayor's suggestion is that a line from the Greenwood shop in South Gardner to Templeton could be run to the advantage of many patrons.

However, there are members of the Gardner City Council who feel discontinuance of the railway would be the loss of a modern and indispensable facility.

Templeton residents are disturbed at

the possibility of the discontinuance for it would leave them without access to Gardner or other nearby places.

Some time ago in answer to a letter from Receiver W. P. Abercrombie of the railway the Gardner City Council expressed a willingness to consider a plan designed by that official for the operation of motor buses in the section, but nothing has come of this. There has been no action on the suggestion also made some time ago by attorneys for the bondholders for consideration by the City Council of a proposed plan for reorganization.

Receiver Refused for Dayton, Springfield & Xenia Southern

Motor bus competition during last year was responsible for the failure of the Dayton, Springfield & Xenia Southern Railway, Dayton, Ohio, to pay the interest on \$396,000 in bonds during the last six months. United States District Judge Smith Hickenlooper was informed of this condition by Province M. Fogue and Judge Harry M. Hoffheimer, attorneys representing the company, when Frank Dinsmore and Judge Walter Shohl, Cincinnati, representing the First Wisconsin Trust Company, Milwaukee, trustee of the mortgage under which the bonds are secured, sought the appointment of A. H. Effner, former general manager of the Cincinnati, Georgetown & Portsmouth Railway as receiver of the lines and properties of the Dayton, Springfield & Xenia company.

Judge Hickenlooper, after hearing the arguments of counsel on both sides on the motion of the Wisconsin company for appointment of a receiver to take charge of the company, declined to make an appointment at this time and intimated that in his opinion the appointment of a receiver would not be to the best interest of the parties concerned. The court intimated also that from the evidence it had gathered there is a family controversy involved in this case and that unless it is shown that the company is insolvent it will not be disposed to grant the motion for a receiver.

The bill of complaint of the Wisconsin Trust Company was filed in the Dayton Federal court, Oct. 2. In the bill, it is said, it was alleged that the defendant company had defaulted interest due on outstanding bonds of a bond issue of \$500,000 secured by mortgage to the Wisconsin company and that to protect the interests of bondholders the mortgage should be ordered foreclosed and a receiver appointed forthwith to take charge of the properties of the defendant company.

It was on the motion for the appointment of the receiver that the case came for hearing before Judge Hickenlooper, Oct. 6. The company, through its counsel contended that if a receiver were appointed it should be T. A. Ferneding of Dayton, vice-president and general manager of the company, whose administration of the defendant company's

affairs had been all that could be expected, it was stated. It was declared that Mr. Ferneding is one of the principal owners of the bonds secured by mortgage to the complainant trust company and that his record as general manager has been such as would entitle him to the full confidence of the court in the event the court should see fit to appoint a receiver.

In his statement to the court showing the loss of revenue of the defendant company through motor bus competition, Attorney Pogue stated that the company lost 71,000 passengers last year. Mr. Pogue declared emphatically that the company is not insolvent and that there is no reason for the appointment of a receiver at this time.

Indications Point to Insufficient Return in New Orleans

R. S. Hecht, chairman of the board of directors of the New Orleans Public Service, Inc., in making announcement that the books of the company for the last quarter of 1923 had just been closed, declared that, in the absence of detailed figures, the indications seemed to be that the earnings of the company have been insufficient to make a rate of return of 7½ per cent on the allowed valuation under the company's reorganization agreement, though the earnings justify the rate of return on the company's bonded indebtedness of \$42,000,000.

Mr. Hecht does not anticipate that the company will make application for higher rates because of its failure to carry out successfully its compromise agreement; on the contrary, he is of opinion that when the public utilities have been thoroughly rehabilitated, which they were not during the best part of the trial year, the rate return of 7½ per cent will yet be earned on an even lower scale of rates for gas and car fares.

Large sums had to be raised to bring the public utilities to the desired standard of efficiency, so that their affairs could be economically administered; but with a new power unit recently installed and a large addition of street cars, of greater seating capacity, all of which were lacking when the trial test was started, a further test under present rates may be advisable, to learn definitely whether greater operating economies will not make it possible to earn the 7½ per cent return. The detailed figures will not be available for two or three weeks, Mr. Hecht said, when it is purposed to go over the entire year's operation with Commissioner Paul H. Maloney of the Department of Public Utilities.

Auction Sales in New York.—At the public auction rooms in New York on Oct. 10 there were sold fifty shares of West Virginia Traction & Electric Company preferred, \$50 lot, and three shares of Toledo Traction, Light & Power Company 6 per cent cumulative preferred, \$82 per share.

Foreclosure Suits Filed

Mortgage Bonds of \$30,000,000 Matured Oct. 1—Interest Centers on United Railways' Suburban Properties

The first of two threatened suits to foreclose on property of the United Railways, St. Louis, was filed in the United States District Court in St. Louis on Oct. 2 in behalf of a Colorado holder of \$4,000 of the general mortgage 4 per cent bonds of the company which fell due Oct. 1.

The action was brought by Ephraim Caplan, who filed the original suits for the receivership against the company several years ago. The suit names the United Railways and Rolla Wells, receiver, as defendants, as well as the St. Louis Union Trust Company, trustee under the mortgage securing the bonds. The total general mortgage bonds maturing Oct. 1 was \$30,000,000. They were issued in September, 1899.

Foreclosure on the property of the St. Louis & Suburban Railway part of the United Railways system is planned by Samuel B. Jeffries, representing a committee of the bondholders. This action was decided upon some time ago. On Sept. 29 the Suburban bondholders were successful in their efforts to have Federal District Judge Faris deny the application of Receiver Rolla Wells for permission to extend the time for payment of the three underlying bond issues aggregating \$4,100,000 due on Oct. 1.

The foreclosure suit contemplated by Mr. Jeffries would bring about the sale of the Suburban property and a separation of the merged systems. There are \$4,500,000 general mortgage suburban bonds outstanding. These bonds expired on April 1 but the time for payment was extended to Oct. 1. Demand for payment on that date was made on Receiver Rolla Wells several days ago.

OUTSIDE INTERESTS WANT SUBURBAN CONTROL

Powerful outside interests are said to be anxious to get control of the Suburban property, which includes the Hodiament, Sarah, Union, Manchester and the Kirkwood-Ferguson lines. In this connection the Studebaker-McKinley interests have been mentioned. It is said that should this group take over the Suburban lines they would be merged with the McKinley Traction System, which now enters St. Louis, and form the nucleus for a St. Louis-Kansas City interurban line. This system would also have connections with Danville, Peoria, Springfield and other important points in Illinois, and possibly within a very short time a line into Chicago.

Part of the plans for a reorganization of the Suburban is an elevated system along the right-of-way of the Hodiament line, which has a private right-of-way between Vandeventer and Morgan streets and the old Suburban Garden in Wellston. This would give St. Louis rapid transit, something for which the city is sadly in need.

Traffic and Transportation

Birmingham Railway Starts Bus Operation

As a result of the abolishment of the jitneys in Birmingham, Ala., the Birmingham Railway, Light & Power Company is planning the installation of a number of motor bus lines to run to sections of the city not reached by the street cars at the present time.

One of these bus lines went into service Oct. 6 and is being operated successfully from Birmingham to Tiddesville, a suburb lying several miles out. Another line will be established soon operating from the city of Birmingham to the suburb of Milner Heights.

Permits for the operation of these bus lines were issued by the city commissioners of Birmingham, Oct. 6. Under a new city ordinance each one of the buses operated by the company is required to make a bond of \$10,000. Bonds for the two bus lines named are already made. Arrangements are made on these bus lines for the separate accommodation of both whites and negroes.

All bus lines established by the company will connect with car lines of the company, and transfers will be issued for both the cars and the buses for the additional sum of 2 cents, the same as is charged for a transfer from one car line to another.

Dispute Over Terminal Site

The permit of the Orleans-Kenner line to use North Rampart Street between Canal and Tulane Avenue as a terminal having long since expired, the Commission Council of New Orleans, upon completion of the reorganization of the New Orleans Railway & Light Company, served notice upon the company that it would have to vacate the street that it had been using without authority as a terminal. This is one of the most heavily congested thoroughfares in the city. It is traversed by several electric railway lines and on it is located the present terminus of the Spanish Fort Railway, which operates between the city and summer resorts along Lake Pontchartrain.

The Commission Council selected a site for the Orleans-Kenner line on Howard Street. This arrangement brought on a storm of protest from the people of Jefferson Parish, the other terminal of the road, as well as objection from the members of the police jury of the parish. The site selected was objected to on the grounds that it was too far away from the shopping district and would work a hardship upon the people of Jefferson Parish, contiguous to New Orleans, who made most of their purchases in this city. At a conference held recently with Commissioners Maloney and Ray of the Departments of Public Utilities and

Public Safety and representatives of the Orleans-Kenner road, the New Orleans Public Service, Inc., and the police jury of Jefferson Parish, a site on South Liberty Street between Tulane Avenue and Canal Street, only a short distance away from its present terminal, was tentatively agreed to by all parties to the conference and the incident was presumed to be closed.

It now develops that the residents of South Liberty Street, at the point selected for the new terminus of the Orleans-Kenner Railway, object to the agreement reached and have suggested in its stead that the terminal be placed in the rear of the Elks' Home. It is barely possible that the Orleans-Kenner Railway may be compelled to stop operation at the Orleans Parish boundary line and issue transfers good from that point into New Orleans over the lines of the Public Service, Inc.

The South Liberty Street protestants will be heard by the Commission Council.

Freight Service at Night North from Indianapolis

Improved interurban freight service in northern Indiana territory has been arranged by the Union Traction Company of Indiana. The new service will enable Indianapolis wholesalers and business firms to compete more advantageously with Chicago firms. H. A. Nicholl, general manager of the railway, has notified John B. Reynolds, general secretary of the Chamber of Commerce, that a new freight car, the "Cannon Ball Freight," will leave Indianapolis every night at 11 o'clock, arriving in South Bend, Ind., the next morning at 8 o'clock.

The new freight schedule will enable Indianapolis wholesalers to receive and load shipments the same day and deliver goods in South Bend and Chicago territory the next morning. This will give the local dealers a decided advantage over Chicago shippers, it is pointed out.

Efforts have been made to obtain improved interurban freight facilities to the territory about South Bend.

Temporary Permits No Longer Good.—The New Jersey Public Utility Commission issued an order on Oct. 5 directing all buses operating parallel to trolley lines on temporary permits issued by municipalities to withdraw at once. If any drivers disobey the order, the commission will request William L. Dill, Motor Vehicle Commissioner, to revoke their operators' and registration licenses. This action came after a hearing at the headquarters in Newark of the utilities body. Harry V. Osborne, president of the board, announced that Commissioner Dill had agreed to co-operate in carrying out the order.

Court Approves Jitneys in Columbia

"Jitney" drivers in Columbia, S. C., have scored two victories in the courts during the past few days, and as a consequence the competition which the Columbia Railway, Gas & Electric Company is meeting with will likely be redoubled. Recently the South Carolina Supreme Court held that the city ordinance prohibiting the operation of motor vehicles for hire on certain sections of Main Street, save under restricted conditions, was null and void. The ordinance, the court interprets, is an attempt to legislate the "jitneys" out of existence. The case originated in the City Recorder's Court, where a jitney driver was tried and convicted of violating the ordinance. The case was then appealed to an associate justice of the Supreme Court, who decided that the ordinance was null and void.

The other victory for the jitney drivers was won in the Court of Common Pleas. At a recent session of the Legislature the South Carolina Railroad Commission was given authority to supervise and regulate the operation of "public" utilities. Under this clause the railroad commission undertook to regulate the operation of motor vehicles for hire, and for the protection of passengers required the vehicles to be bonded. Some drivers arranged for the bond and others continued to operate without the bond. The commission then sought an injunction requiring the drivers to show cause why they should not be enjoined from further operating the jitneys until they had complied with the requirements. The case was argued and the judge refused the petition for an injunction, holding that "public utilities" were limited to concerns furnishing gas, electricity, heat, etc. This case, however, will be taken to the Supreme Court.

Changes in Night Service on Boston Elevated

All night service into the Tremont Street subway in Boston will be instituted Oct. 14, it has been announced by the Boston Elevated. Night car service now operated to Adams Square will run into Tremont Street. Cars will run on present schedules, using the subway instead of surface lines. Shuttle service will be operated in the Tremont Street subway connecting the lines which run to Park Street with those that run to Brattle Street. Transfer privileges will remain as at present. The keeping open of the Tremont Street subway through the night is only one of the several requests for changes in the night service that could be granted. The continuance of the 5-cent fare service from 12 a.m. to 5 a.m., the Elevated officials say, is out of the question, owing to the light traffic and consequent lengthening of routes during that period. The officials also state that a 5-cent service over one line for the benefit of a special class of patrons would constitute unjust discrimination.

Interurban's Interstate Rates Not Unreasonable

Rates on commodities in carloads from local stations on the line of the Boise Valley Traction Company, Idaho, to interstate destinations, have been found by the Interstate Commerce Commission not to be unreasonable or unduly prejudicial.

The rates were attacked by shippers on the ground that they are unduly prejudicial to the local points on the traction line. The commodity rates are made by a combination of the traction line's local rates to the junction point and the steam carriers' rates beyond. The electric line, including branches and side track, is 80 miles in length. It extends from Boise along the north bank of the Boise River to Middleton. There it connects with the Oregon Short Line Railroad's Idaho Northern branch. It then crosses the river and connects with the main line of the Oregon Short Line at Meridian. The traction line owns little freight equipment. It interchanges only three of its box cars with the Short Line and those are used in switching service only. It depends upon the Short Line for equipment used in interstate shipments.

In its decision in the case, the commission, among other things, says:

The financial condition of the traction line is unfavorable. During 1921 it failed to earn operating expenses and interest on its funded debt by more than \$54,000. Its general manager testified that its rates were established on a low basis due to the fact that the blanket rates did not apply to or from points local to its line.

Commissioner Campbell, in a dissenting opinion, holds that the shippers on the electric line are being subjected to prejudice because the Short Line fails to grant them the same rates as are granted to shippers on other short and branch lines. He said:

The situation disclosed by the record in this case indicates that the complaining shippers are laboring under a great disadvantage and I cannot sanction the action of the majority in depriving the shippers of the relief they seek and to which I believe they are entitled.

James F. Hamilton a Model for Employees

The successful career of James F. Hamilton, who in twenty-one years rose from conductor to the presidency of the New York State Railways, is cited in a message to the platform men of the Rochester lines of the system by Charles R. Barnes, City Commissioner of Railways, in a recent issue of the employees' magazine. In this message the commissioner points to the rapid climb of the railway executive as an example. That courtesy is an important factor in success in the traction field is stressed by Mr. Barnes.

His appeal says in part:

You are engaged in a legitimate occupation. Your uniform should be as highly respected as any other in the city. It is up to you men to maintain such a condition. This can be done by furnishing proper service to the people, which, as far as you are concerned, consists in polite and courteous treatment—in so far as possible, having your trains on time, stopping to receive and discharge passengers, when or where as provided for by the rules, keeping your cars

neat and tidy, and paying special attention to your personal appearance.

Presidents of railway companies are not born; they are made. The president of your company is an illustration of that statement. He rose to his present position by strict attention to his business along the lines I have suggested.

Bus Franchise Deferred

Efforts of E. W. Hicks of Worcester, Mass., to establish a jitney service between Clinton and Sterling and Clinton to Worcester were unavailing when the Clinton Selectmen put off granting a franchise. Opposition to the establishment of the lines had previously developed from the Chamber of Commerce of the town, although it was not shown when the Selectmen considered the matter. It is said the chamber is not opposed to the Sterling and Clinton line, but has objections to any line that would compete with the Worcester Consolidated Street Railway between Clinton and Worcester. The Clinton Selectmen have not entirely discouraged any attempt by Mr. Hicks to get the franchise for they have notified him their action is simply held in abeyance to give any person or persons who cares to enter objection a chance to do so. Mr. Hicks has informed the Selectmen he has no intention of competing with the trolley lines. He is desirous of getting the Sterling to Clinton route approved, he says, to enable him to connect with the line he now operates between Worcester and Holden and Jefferson.

Authorizes Abandonment, Then Gives Bus Permit

The Public Service Commission has granted the request of the Elmira Water, Light & Railroad Company, Elmira, N. Y., to abandon a portion of its trolley line operating from Elmira to Horseheads and Watkins, on the ground that the line has not paid operating expenses for some years. At the same time the commission granted a certificate for the operation of a bus line as a substitute to supply the needed transportation facilities. The order permitting the abandonment provides that the company shall do so at its own expense and that during the time that the tracks remain, the company shall, at its own expense, keep in good repair that portion of the highways and paved streets that are now required to be kept in repair under the present statute.

The bus certificate is issued to Mr. Marshall and provides that "no local passengers shall be carried from one point to another on that part of the route between the terminal of the city of Elmira and the northerly boundary of the village of Horseheads." He is further directed to bring all buses to a dead stop when approaching railroad crossings, if any exist, and to exercise care in crossing the tracks. He is not to sell his certificate without the approval of the commission. Residents of the communities interested urged the granting of the certificate to Mr. Marshall in the event of the discontinuance of service by the trolley line.

No Reduction in Fare in Quincy

Charles G. Wadleigh, chairman of the public trustees of the Eastern Massachusetts Street Railway, has replied in the negative to the petition of Mayor Bates of Quincy that a 5-cent fare be established from the outlying sections of the city and a 3-cent additional charge for a transfer. The present rate is a 10-cent fare from all points at the edge of the city to the center, although the company sells a sixteen ride ticket for \$1.

The petition presented by Mayor Bates was the result of an effort made by the workmen of the Fore River Shipbuilding Corporation, who claimed they were paying 40 cents a day to get to and from work, while still living in the precincts of the city of Quincy.

In answering Mayor Bates' request, Mr. Wadleigh said:

In 1919 and 1920 the Quincy district failed by very large amounts to earn the cost of service. Up to about the middle of 1920, the non-profitable lines of Hingham and Weymouth were included in the Quincy district, but at that time they were set apart as separate districts, and Quincy relieved of the burden. Since 1920 the Quincy district has been fortunate in having but little burden from lines outside the city.

In 1921 the district failed to earn the cost of service by \$15,713. In 1922 it earned the cost of service by the narrow margin of \$4,621. For the first seven months of 1923 the cost of service has been earned with a margin of only \$1,799.

In 1920 there was a 10-cent cash fare in Quincy, with a ticket rate of 8½ cents. Since that time the ticket rate has been lowered three times, as operating results warranted, until now the rate is 6½ cents per ride. The last reduction in fare to the present rate was made only a little over four months ago, and, as is usual on every reduction in rate, has resulted in a reduction in earnings.

It has been possible to keep the present ticket rate only by practicing the utmost economy and efficiency in operation.

As you are undoubtedly aware, an arbitration board has just recently awarded the carmen in Quincy a substantial increase in wages, which is retroactive to May 2 of this year. This is an additional expense which must be met out of car fares, and it has been a serious question in our minds whether we would not be compelled to increase fares in order to get sufficient funds to pay it. We intend to make every effort to meet it without increasing fares.

Allows One-Man Cars for Interurban Service

The Railroad Commission has authorized one-man interurban service by the Eastern Wisconsin Electric Company on its Fond du Lac, Oshkosh, Neenah and Menasha interurban division. The commission in its decision allowing the company this service examined the financial figures, which showed that for the first six months of the year 1923 there was available from earnings for depreciation and return on investment for the electric railway system an amount equaling only 2.26 per cent of the value of the railway property used and useful for the public. In view of the competition to which the company is subjected by reason of steam railroad and motor bus transportation, it is doubtful if an increase in rates would result in a material increase in revenue. The commission believed that all economies in operation consistent with public safety and convenience should be adopted by the company.

Personal Items

Thomas V. Campbell Appointed Maintenance Superintendent

Thomas V. Campbell has been appointed superintendent of maintenance of the New York & Queens County Railway, Long Island City, N. Y., and started on his new duties Sept. 17.

Mr. Campbell began his railroading career in 1898 with the old Metropolitan Street Railway of New York and was with it for ten years, serving in various capacities from dynamo wiper to shop foreman. In 1908 he took charge of the equipment of the Yonkers Railroad. In 1911 he was appointed shop foreman of the New York City Interborough Railroad, which later became part of the Third Avenue Railway system. His next position was as shop foreman of the Smith Street division of the Coney Island & Brooklyn Railroad, which position he held until February, 1914, when he went with the Public Service Railway of New Jersey, remaining there three years and leaving to accept a position with the Submarine Boat Corporation in charge of the electrical installation on vessels that company was turning out during the war period. In March, 1921, Mr. Campbell became master mechanic of the Jersey Central Traction Company at Keyport, N. J.

Mr. Campbell's duties in his new position with the New York & Queens County Railway include the maintenance of the transmission and distribution system, as well as rolling stock and buildings.

George S. Brush with Motor Company

George S. Brush, for the last five years superintendent of transportation of the Houston Electric Company, has resigned to go to New York, where it is announced that he will become associated with a company manufacturing trucks.

Mr. Brush has been a prominent figure in the railway field since 1908, when he entered the employ of the Boston Elevated Railway in the transportation bureau. During vacation time, prior to this, he was employed by the Middlesex & Boston Street Railway, at Newtonville. Here he did original work in the direction of publicity for traffic stimulation. From the transportation bureau of the Boston Elevated, he was transferred to the president's office, later to the claims department, and in 1910 was appointed chief clerk of Division 6, with headquarters at Sullivan Square terminal, Charlestown. He later became chief clerk of Division 8, which comprised the entire business section of Boston and included all surface cars, subways and tunnels.

In December, 1915, Mr. Brush was

appointed superintendent of the railway department of the Cumberland County Power & Light Company, in Portland. He left that position early in 1918 to become superintendent of transportation of the Springfield Street Railway, Springfield, Mass., succeeding F. V. Fabian. In the fall of 1918, Mr. Brush tendered his resignation as superintendent at Springfield and accepted the position of superintendent of the Houston company, a Stone & Webster property.

Mr. Brush was born in Stillwater, Minn., in 1884. He was educated at the Massachusetts Institute of Technology, taking the course in mechanical engineering. While he was engaged at Portland with the Cumberland County property, he was regarded as one of the best younger operating executives in New England electric railway circles.

Another Promotion for I. W. Pettengill

I. W. Pettengill, who recently was made secretary and general manager of the Cincinnati, Milford & Blanchester Traction Company, which promotion was referred to in the *ELECTRIC RAILWAY JOURNAL*, issue of Sept. 15, has been elevated to the presidency of the interurban company. He succeeds J. P. Peurrung, who resigned after ten years service to engage in the match manufacturing business in Cincinnati. Before his affiliation with the interurban company, Mr. Pettengill was electrical engineer for the Cincinnati Screw Company, Loveland, Ohio.

Henry Kroger, a son of B. H. Kroger, owner of the Cincinnati, Milford & Blanchester Traction Company, has been made secretary and treasurer, while Chester Kroger, another son, has been made assistant secretary and treasurer. Under the previous arrangement Henry Kroger was treasurer and Chester a director of the interurban company. As president, Mr. Pettengill will be in active charge of operations.

H. D. Cowles Chief Inspector

E. M. Walker, president of the Schenectady Railway, has announced the appointment of H. D. Cowles, an electric railway man of twenty-three years' experience, to the new post of chief inspector. In future, all inspectors and motorman instructors will report to Mr. Cowles, who will have an office in the waiting room in State Street, Schenectady. Mr. Cowles has been associated with the company in Schenectady for the past four months.

From 1901 to 1907 he was a motorman on the Hudson Valley lines. For the next ten years he served the same company as train dispatcher and inspector. For three years beginning in

1917 he was assistant superintendent in Youngstown and since then has been with the New York State Railways in Rochester as chief inspector and then with the United Traction Company in Albany.

Ralph Peters Dead

Was One of the Biggest Figures in American Railroading—Transformed L. I. R.R. Into Great Trunk Line

The man who changed a summer excursion line to one of the greatest passenger railroads in the United States died suddenly on Oct. 9 at his home in Garden City. He was Ralph Peters, president of the Long Island Railroad for eighteen years. On Nov. 19 next, his seventieth birthday, he would have completed fifty years in the railroad business. The romance of railroading was probably born in him, as his father, Richard Peters, was one of

Ralph Peters

the pioneer railroad builders of the South.

Ralph was born in Atlanta, Ga., and after graduation from the University of Georgia entered the employ of the Atlanta Street Railways, serving in the capacity of superintendent and purchasing agent for two years. Later he went to the Pennsylvania Railroad. From 1901 to 1905 he was general superintendent of the Southwest System of the Pennsylvania Lines West of Pittsburgh, with office at Columbus, Ohio. When in April, 1905, a vacancy occurred in the position of president and general manager of the Long Island he was selected for that office. Since that date he had been at the head of the Long Island System, as president and chief operating officer of the Long Island Railroad, New York & Rockaway Beach Railway, New York, Brooklyn & Manhattan Beach Railway, Montauk Steamboat Company, Ltd., and eighteen other subsidiary lines.

When the government took over the control of the railroads in 1918 Mr. Peters was selected as Federal manager of the Long Island System. He accepted the post and was relieved of his duties as president of the corporation until March 1, 1920, when the railroads were returned to their owners.

The growth of the Long Island Rail-

road is a monument to the untiring energy and extraordinary perseverance of Mr. Peters, who converted this line from an excursion line to one of the greatest trunk line railroads in the country.

One of Mr. Peters' greatest achievements was in the matter of electrification. Electric train service was started in 1905 between Flatbush Avenue terminal, Brooklyn, and Rockaway Park. Since that date electrification has been extended until now there are 227.2 miles of electrified track in operation on the Long Island System.

In 1905 the system carried 18,000,000 passengers and 2,745,000 tons of freight. In 1922 the road carried 79,656,891 passengers, while freight to the amount of 6,027,860 tons was hauled. More than \$50,000,000 has been invested in improvements and equipment on the road since Mr. Peters assumed the presidency.

During his eighteen years as head of the Long Island he has done more than any single man or organization to promote and develop the agricultural resources of Long Island and was instrumental in bringing about the cultivation of tens of thousands of acres of hitherto idle and non-producing land on the island.

His was a policy of expansion and development. Although he lived to see many of his dreams of reconstruction and transformation come true, he still had a vision of the time when all the branches of the system would be electrified, and a four-track line from one end of the island to the other, and when Montauk Point, at the extreme eastern end of Long Island, would be a monumental port of entry for transatlantic steamers.

Although a busy executive in the railroad field, Mr. Peters cultivated other interests also. He was a member of the Society of the Sons of the Revolution and of the Colonial Wars Society and held membership in the Union League Club of New York and the Cherry Valley Golf Club of Garden City. He is survived by his wife, a son, Ralph, Jr., who is superintendent of transportation of the railroad, five daughters, a brother and a sister.

Lewis R. Schenck

Lewis R. Schenck, president of the Toledo & Indiana Railroad, Toledo, Ohio, died suddenly on Oct. 4 at his home in Toledo. For many years Mr. Schenck was connected with the J. G. White Engineering Company in New York City. When his father, S. C. Schenck, died he returned to Toledo and took up the management of the S. C. Schenck Coal Company and following the death of his brother he was elected head of the Toledo & Indiana line of which his father and brother had been president in turn. Mr. Schenck was born in Toledo, July 29, 1880. After he was graduated from the public schools he attended St. Paul Preparatory School in Concord, N. H., and later entered Yale from which university he was graduated in 1904.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions
A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

59,008 Surplus Cars on Sept. 22

The railroads of the country on Sept. 22 had 59,008 surplus freight cars in good repair and immediately available for service. This statement is in accord with reports filed by the carriers with the Car Service Division. On the same date the reported car shortage for the country as a whole was 13,515 cars. Compared with Sept. 14, the number of surplus freight cars on Sept. 22 represented a reduction of 10,072, while there was an increase of only 270 cars in the reported car shortage in the same period. The railroads reported on Sept. 15 that they had fewer freight cars in need of repair than at any time since May 15, 1920. The number in need of repair on Sept. 15 totaled 165,284, which represented a decrease of 10,043, compared with the number in need of repair on Sept. 1, at which time there were 175,327.

Anaconda Buys National Conduit & Cable Hastings Plant

The American Brass Company, an Anaconda Copper subsidiary, has purchased at receiver's sale the plant of the National Conduit & Cable Company for \$3,000,000. Confirmation of this sale was made Oct. 4. The purchase price is the amount of bond issues standing against the property of National Conduit & Cable at Hastings-on-Hudson, N. Y., the bulk of which was bought up some time ago by Anaconda.

The rod and wire mill at Hastings, which is the property purchased, has a capacity of 10,000,000 lb. per month and is in good condition, requiring only minor changes to make it efficient.

This new purchase by the Anaconda organization fortifies those wire mills so located as to cater economically not only to domestic but to world demand. The Hastings plant is particularly well adapted to the exporting of copper rods and electric wires to continental Europe.

Second Power Show Scheduled

The 1923 Exposition of Power and Mechanical Engineering will be held in the Grand Central Palace, New York City, Dec. 3 to Dec. 8. The number, diversity and interest of the exhibits of the second exposition promise to excel those of the first exposition held in December, 1922. The exhibits will be supplemented by an extensive program of moving picture films to be presented in co-operation with manufacturers. Last year the picture program was found to interest the layman who was not informed about technical processes and the engineer whose close application to

one field of his work had not enabled him to keep up with progress in the rest of the profession.

About two hundred exhibitors have signed contracts for space.

Chilean Railways to Obtain Block Signaling Materials from Union Switch

The electrification of the Chilean State Railways from Valparaiso, on the Pacific Ocean, to Santiago, the capital, located in the foothills of the Andes Mountains, is the most extensive trunk line electrification yet undertaken in South America. This railway, part of which is single and part double track, connects the metropolis of the west coast of South America with its most important seaport, traversing a mountain range having an elevation of 2,500 ft. The first regular electrically operated train was run over a portion of the line in July. It is anticipated that the installation will be completed and all trains electrically operated by Jan. 1.

Contract has been awarded the Union Switch & Signal Company for 515 Style R color light signals, 1,189 alternating-current relays, impedance bonds, check-locking circuit controllers, track and line transformers, pot signals, instrument housings, etc., for complete track circuit signaling between Valparaiso and Santiago, where the signals are semi-automatically controlled, and for the signaling of the Los Andes branch, where the control is manual. Check-locking using Union Switch Electrically locked circuit controllers, including complete track circuit control, will be installed on the single-track portion of the main line.

The construction work will be handled by the railway company's forces under the supervision of W. J. Evans, chief of the department of signals, telegraph and telephone, and P. Godoy, his assistant.

Metal, Coal and Material Prices

Metals—New York		Oct. 9, 1923
Copper, electrolytic, cents per lb.	13.00	
Copper wire base, cents per lb.	15.25	
Lead, cents per lb.	6.85	
Zinc, cents per lb.	6.61	
Tin, Straits, cents per lb.	42.25	
Bituminous Coal, f.o.b. Mines		
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	\$4.825	
Somerset mine run, Boston, net tons	2.375	
Pittsburgh mine run, Pittsburgh, net tons	1.875	
Franklin, Ill., screenings, Chicago, net tons	1.25	
Central, Ill., screenings, Chicago, net tons	.70	
Kansas screenings, Kansas City, net tons	2.25	
Materials		
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	\$6.60	
Weatherproof wire base, N. Y., cents per lb.	18.00	
Cement, Chicago net prices, without bags	\$2.20	
Linseed oil (5-bbl. lots), N. Y., per gal.	\$0.98	
White lead, in oil (100-lb. keg), N. Y., cents per lb.	11.375	
Turpentine, (bbl. lots), N. Y., per gal.	\$1.04	

Rolling Stock

Jacksonville Traction Company, expects to buy four cars for use in South Jacksonville.

Kitchener & Waterloo Street Railway, Kitchener, Ont., it is reported, will soon be in the market for several new street cars.

Knoxville Power & Light Company has placed an order with the Cincinnati Car Company for fourteen cars of the most modern type. The order specifies seven single-truck cars and seven double-truck cars. The cars will cost \$134,000 and first deliveries have been promised for February, 1924. The reported purchase was referred to in the *ELECTRIC RAILWAY JOURNAL* of Sept. 22.

Track and Line

Frankford, Holmesburg and Tacony Railway, Philadelphia, during the present year has constructed and equipped with new rails 2 miles of road and it is proposed to construct 2 miles more next year and another 2 miles in 1925.

Princeton Power Company, Princeton, W. Va., will extend the west end line in Graham to Maple Hill Cemetery and Shelby Heights and the loop line to the fair grounds and Bluefield College.

Conestoga Traction Company, Lancaster, Pa., is building a new section to the Ephrata-Lancaster line which will pass through Talmage, Brownstown and Akron. Construction is expected to be completed by Nov. 1.

Asheville Power & Light Company, Asheville, N. C., is arranging for improvements to relieve congestion in the Pack Square district. A loop system of tracks will be laid and new equipment added. The improvements will cost about \$200,000, C. S. Walters, vice-president and general manager, announces.

Power Houses, Shops and Buildings

Illinois Power & Light Corporation, Chicago, is planning to construct a power house at Venice, to cost \$1,200,000.

Tri-City Railway, Rock Island, Ill., has decided not to erect the planned carhouse in Moline, it was learned. The project would have cost the company \$60,000. The company, after considering the matter for some time, decided it could not afford to undertake this construction at this time.

Fort Dodge, Des Moines & Southern Railroad, Boone, Iowa, is improving its property, especially at Boone and Fort Dodge. The W. J. Zitterell Company has been awarded a contract for the erection of a new carhouse at Boone. President C. H. Crooks of the Fort Dodge line has announced that construction has already been started

on the new buildings which are being erected at Fort Dodge, replacing structures destroyed recently by fire. The contracts for the new carhouse and yard office were let recently. The buildings will be of modern construction, brick and concrete, and the total cost will be about \$150,000.

Trade Notes

American Gear Manufacturers' Association will hold its seventh semi-annual meeting at the Mountain House, Lake Mohonk, New York, Oct. 25, 26 and 27. The first general session of the meeting will be on Oct. 25, when the new president of the association, George L. Markland, Jr., of the Philadelphia Gear Works will preside. On Oct. 26 A. W. Copeland of the Detroit Gear & Machine Company will preside over a special meeting of the automotive group for the discussion of conditions in that industry.

Norma Company of America, Long Island City, has placed contracts for the erection of the first unit of its new plant upon its property recently acquired at Stamford, Conn. The company's Stamford plant will be equipped for the manufacture of Hoffmann precision roller bearings, the American rights to which, as well as to all other Hoffmann products, were recently acquired by the company from the Hoffmann Manufacturing Company, Ltd., of Chelmsford, Essex, England. The plant will also be equipped for the expansion of the manufacture of Norma precision ball bearings. The company's present plant at Anable Avenue, Long Island City, will be continued for the production of Norma precision open-type annular ball bearings.

Elliott Service Company, 244 W. Forty-ninth Street, New York, has announced through C. W. Price, vice-president in charge of the public safety division, that there is now available for the electric railways interested in reaching the public with the safety idea a plan for bringing about the introduction of instruction in accident prevention in the public schools in their respective communities. According to Mr. Price, electric railway executives were among the first to realize that the problem of street accidents will not be solved until the safety idea has been brought into the home, and that this can be done most effectively by getting school children interested in safety. Because of the increasing demand for literature and other material which could be used to introduce this subject in public schools, Dr. E. George Payne, professor of education of New York University, and author of the first definite plan for safety instruction in public schools, has prepared a series of eighteen pamphlets for superintendents, principals and teachers, together with detailed instructions and suggestions for the introduction of safety instruction in the present curriculum in the school system. This entire series by

Dr. Payne may now be secured by electric railways for introduction in the public school system in their respective communities as part of the complete public safety service of the Elliott Service Company. Dr. Payne's plan is now in use in the schools of more than 100 cities. It is said that its adoption has made it possible for the cities of St. Louis, Kansas City and Detroit to cut accidents to children practically in half. In recognition of his pioneer work in this field and because of the growing interest in the subject of school safety on the part of students and graduate teachers New York University has created for Dr. Payne the first collegiate chair in safety education.

New Advertising Literature

Southern Pine Association, New Orleans, La., has issued the ninth revised manual of standard wood construction. This edition contains the information needed to solve every-day problems in wood construction.

Roller-Smith Company, New York, N. Y., has issued bulletin No. 450, describing alternating-current switchboard instruments, and bulletin No. 560 on the "safety" circuit breakers Types "P" and "E."

Rome Wire Company, Rome, N. Y., has issued two pamphlets, one describing its special, extra-flexible electric welding cable and the other the new super-service junior cord, suitable for many applications. A booklet of twenty pages has been produced giving full information on the super-service cords and cables.

Ohio Brass Company, Mansfield, Ohio, has issued its 1924-1925 catalog, which is a substantially bound book of nearly 800 pages, with special diagrams on high-tension insulators, trolley line materials, rail bonds and tools, third rail insulators and car equipment specialties. The book contains a classified index to materials, a catalog number index and a code word index.

Uehling Instrument Company, Paterson, N. J., has issued a new bulletin, 116A, which illustrates three simple devices which, it is claimed, completely eliminate three troublesome elements of the CO₂ recorder. In other words, they permanently prevent fouling and corrosion of the CO₂ equipment and the tubing which conveys the gas sample to the instrument continuously. These three devices are known as the "Pyro-Porus" filter, the gas drier and the gas purifiers. The bulletin also illustrates the small bore seamless drawn tubing used for the gas sampling line. This gives high velocity of gas flow, resulting in quick response to the CO₂ recorder to changes in furnace conditions. This tubing is much easier to erect than pipe, which was formerly employed for the purpose, and practically eliminates all possibility of sampling line leakage, which is a common failing of sampling lines constructed of pipe instead of tubing.

Electric Railway Journal

Consolidation of Street Railway Journal and Electric Railway Review

Published by McGraw-Hill Company, Inc.

HENRY W. BLAKE and HARRY L. BROWN, Editors

A Helpful Program of Activity for 1924

CONTINUED and intensified effort toward good public relations, study looking toward uniform regulatory laws and better franchises, modernizing plant and equipment and practices, study of how to secure relief from unjust tax burdens, further treatment of valuation matters, unification and co-ordination of all forms of transportation, rapid transit, and continuation of the educational work—these are the main topics to which the work of the American Electric Railway Association is to be devoted during the coming year. These are all matters in which the industry has a keen interest, hence the year's work should prove very helpful.

One particularly important assignment is that of modernization. In line with the recommendations of the subjects and meetings committee, this topic is to be handled by two committees, one on city operation and one on interurban operation. The object sought is to emphasize the need for modernization and to show what can be done in this direction. Much more has been done along this line by city properties than by interurban. Hence the work of the interurban committee will be particularly timely. The need here for improvement in nearly every way is so great that the opportunity of this committee to perform a real service to the interurban lines is exceptional. Its efforts will certainly be appreciated and welcomed by the interurban operators.

The study of the bus this year by the parent association will be devoted to the economics of the transportation needs of the community as a whole. The affiliated associations will consider operating details of the bus.

The Accountant Has a Real Opportunity

THE importance of the work of the accountant was well exemplified by the proceedings of the Accountants' Association published in the *ELECTRIC RAILWAY JOURNAL* this week. President W. G. Nicholson stated the matter concisely when he said in his address that the utility accountant of today is more than a book-keeper, and that he must be well informed in all the various branches of the business.

Some of the topics discussed were co-operation with the national associations of other utilities and utility commissioners to standardize accounting methods, control of expenditures by the budget system, classification of accounts for subsidiary bus operations and stores accounting. This wide range of subjects gives an indication of the present-day problems with which the accountant is concerned.

The discussion on budgetary control was an indication

of the opportunity before the accountant. In such studies the auditor can analyze the various sources of expenditure and point out where the executive should look to save unnecessary expenditures.

Perhaps more attention should be given to elimination of unnecessary or duplicate accounting work. In the study of some particular problem the executive may call for a certain analysis of accounts continued over a period of perhaps six months or a year. The solution may be obtained and the report forgotten by the general manager, but not by the accounting department. Following the established routine, the report may be prepared month by month, only to be filed away by some clerk without the knowledge of the executive. A close watch should be kept upon special or unusual reports to prevent such a waste of effort.

Altogether the auditor is one of the most useful aids to the management. The writer of this editorial has seen numerous instances where the management did not know the true financial condition of the road, largely because the auditor was unable to give the needed figures in such shape as to be useful. The first step toward making money is to know how to spend money wisely, and if the accounting department can do this a long step has been taken toward making a property successful.

Accountants' Association Should Have Support of More Companies

WHILE the present personnel of the Accountants' Association is quite active in following up the more important questions of the day, it goes without saying that a body of men numbering less than fifty at this time is working under a severe handicap. The membership in the association and the attendance at the conventions need to be increased materially before the industry can be expected to receive the full benefit therefrom. This is largely a matter for the accountants themselves to consider, but at the same time the executives of the various companies are in a position to encourage their accounting officers to enter into the work of the association and should do so whenever possible.

During the past few years the requirements of the electric railway accountant have been increasing steadily. He is continually being called upon to answer new questions and solve new problems concerning which he has no precedents. To a great extent he must work them out on his own responsibility, and in order to be of service to his company he must develop himself. Such self-development can of course come only through years of study and experience, but it can be materially facilitated through personal contact with other members of his profession and mutual discussion of the various problems. This is one of the most, if not the

most, valuable features of the annual convention, and it seems unnecessary to say that it should be encouraged to the fullest extent.

One instance pointed out at one of the meetings of the association is worthy of particular comment, as it clearly shows the value of accurate figures furnished promptly to the management. By means of a detailed statement of maintenance costs on certain types and units of equipment it was possible for the general manager of a large company to keep in touch with conditions from day to day and thereby effect savings amounting to hundreds of thousands of dollars per year. This is an example of what the accounting department can do.

Leadership Needed in Traffic Problems

THE need for more comprehensive knowledge of street traffic and methods of regulating it was emphasized by the report of the committee on traffic regulations of the Transportation & Traffic Association and the ensuing discussion at the Atlantic City convention. The rapid increase of population of our urban centers and the even more rapid increase of the riding habit make the outlook for the future even more serious than the present situation, bad as it is.

Although the greater part of street congestion is due to the rapid increase in the use of motor vehicles, the various national automobile organizations are doing little if anything to reach a solution. The American Electric Railway Association and its affiliated associations have taken the lead and through several committees have made a start. It is little more than this, however, and most of the work lies ahead.

An interesting commentary on the causes of congestion was pointed out in the discussion. Removal of street car tracks is frequently advocated as the one cure for the transportation situation. The falsity of this position is seen from figures collected in Los Angeles and referred to in the discussion, which showed that the automobile traffic on streets without railway tracks was only about 40 per cent greater than that on streets where tracks existed.

When the relative carrying capacity of street cars and automobiles is considered the absurdity of the removal of car tracks to solve the traffic problem is apparent. Regardless of what is said by certain enthusiasts, the street cars carry the bulk of passenger traffic. The committee on traffic regulations pointed out that the average surface car system carries daily a number of passengers more than equal to the entire population of the city it serves. Even in New York City, with its extensive system of rapid transit lines covering four of its five boroughs, the surface cars carry some 40 per cent of the total riders.

The present haphazard methods of regulating traffic should somehow be made more effective from the standpoint of the greatest good for the greatest number. The many palliatives for congestion must be studied, standardized and applied where they can give relief. Municipal authorities must be brought to see that better traffic control is necessary for the continued growth and prosperity of their communities.

In view of the present and growing seriousness of the situation, and the need for immediate constructive work, the American Electric Railway Association can well undertake aggressively to secure the co-operation

and support of all the interests affected. This is essential not only to safeguard the interests of the street railway industry but to render a still larger service to the communities all over the nation.

Definite Results Obtained at the Claims Convention

THE results accomplished at the 1923 convention of the Claims Association will be recorded with credit in the history of that organization. Two subjects which have taken considerable thought by committees as well as time of delegates at previous conventions were settled definitely at Atlantic City. The first of these was the acceptance of a code of ethics for railway claim agents. One of the encouraging signs of the times is the adoption of such codes by organizations representing professional men. It helps the insider to know what to do, and it helps the outsider to know what he may expect from men in that profession. The need of such a code for the railway claim agents has been felt for some time, and this need was well supplied by the code submitted by Mr. Sears of Boston. With one or two slight changes in wording which were suggested by the committee appointed to consider the code and were accepted by Mr. Sears, the code was promptly and unanimously adopted. This code should be of great benefit to the organization.

Extended discussion took place at the claims convention between those in favor of a large claims organization, prepared to look up and settle with prospective claimants, and the advocates of a small organization. The latter based their argument on the theory that if any one wants damages from a railway he should visit the office of the company and make his claim there. Here also a definite conclusion was reached by the delegates, i.e., that neither plan can be followed exclusively to advantage. In some cities, especially where there are large foreign populations apt to be misled by the wiles of the ambulance chaser, outside investigators seem necessary. Nevertheless, it is not too much to say that the evidence presented by Mr. Robinson of Cincinnati of what a very small force can do in favorable surroundings produced a great impression. In the future the burden of proof will rest on the manager of a large staff of claims investigators, adjusters and clerks that such a staff is necessary.

Outside of these two topics, the greatest interest at the Claims Association centered around the subject of automobile accidents. This also has been a perennial subject. The private automobile has done so much direct and indirect damage to the street railway—indirect in taking away its passengers and in blocking its right of way and direct in colliding with its cars—that the outlook seems about as dark as it could be. Nevertheless, here also progress was reported at the Claims convention. On this topic Cleveland seems to be the bright spot in the country, with its traffic courts, though the sun is shining through also at Rochester, Chicago and Detroit, which have courts of this kind, and seems about to break through the clouds in other cities. In fact, the history of the automobile menace promises to follow that of many other evils. When they get too bad, the people will rise up and suppress them. It is the hope of the claims agent that through some central point, perhaps a safety engineer at association headquarters, the coming of this relief may be hastened.

The Brief that Won the Charles A. Coffin Prize for 1923

The Intensely Interesting Story of the Chicago, North Shore & Milwaukee Railroad—a Story of Achievement—as Told in the Company's Brief Submitted to the Charles A. Coffin Prize Committee of the American Electric Railway Association Is Printed Here in Full, Together with a Few of the Illustrations

AS ANNOUNCED in last week's issue of *ELECTRIC RAILWAY JOURNAL*, page 591, in connection with the report of the Charles A. Coffin prize committee, the gold medal in the electric railway field was awarded this year to the Chicago, North Shore & Milwaukee Railroad, Highwood, Ill. The brief submitted by the company is a beautiful example of the printer's art. It is a printed book with a three-color and black process cover, which is re-

produced herewith, though much of the effect is lost by the absence of the colors. Inside, the matter was printed on exceptionally fine deckle edge paper with illustrations printed in sepia, with hand-lettered headings for the main subdivisions of the report and with an insert reproduction of one of the company's three-color and black process posters reproduced in the original colors. The book was well illustrated with graphic charts showing the trend

of the company's business, economies effected, etc., and with numerous pictures illustrating various types of equipment, including motor buses as well as cars, samples of posters used effectively, reproductions of billboard advertising, three pages of newspaper clipping reproductions, one of the company's fine new stations, pictures illustrating safety work and others showing the work the company is doing with its employees. Altogether the book comprises forty-seven pages and represents a considerable expenditure of effort.

The brief of the North Shore Line starts out with an introductory statement which sets forth the eight factors drawn up by the committee to indicate the matter which would be considered in making the award, and then explains the general manner in which these eight points were treated. These eight points were printed in connection with the committee report in last week's issue of the *JOURNAL*. The introductory statement also explains that clauses 3 and 4, which dealt respectively with the introduction of original ideas leading to economies, and the extent to which the company had taken advantage of economies originating with others, were treated jointly. The explanation given is that while many economies in operation on the North Shore Line have resulted from original ideas and experiments, the company has nevertheless not hesitated to apply practices developed on other properties if they seemed to be an improvement. But as it is difficult to substantiate a claim for originality in ideas, the North Shore Line was content to rest its claim for recognition, it said, on the manner in which it has taken advantage of every development in the industry and turned it into achievement. The full statement of the North Shore Line after the introductory chapter follows:

Popularizing Electric Railroad Service

THAT electric railroad service can be made popular; that a railroad can get more riders and more revenue in the face of the keenest competition; that it can get the communities it serves to work for it, instead of against it, is fully proved in the case of the North Shore Line.

It has been done.

Reproduction of the Cover on the North Shore Line Brief

Without increasing its trackage—except to the extent of gaining an entrance to the heart of Chicago over the elevated—the North Shore Line in the seven years of operation under the present management, has seen the number of its passengers double and its gross annual earnings multiply by five. It has seen the gross earnings from its freight traffic multiply by fifteen in five years; grow from an insignificant item to nearly a million dollars a year.

From a railroad patronized only as a necessity when other means of travel were not readily available, it has become "the most talked about electric railroad in the country," and is patronized by thousands of travelers in preference to any other means of transportation in the territory through which it runs.

How was this accomplished?

The answer may be epitomized in a single sentence: *By giving service and telling the public its story.*

SERVICE MUST BE CONVENIENT

An electric railroad to gain and hold the confidence and support of the public, must give a service that is con-

venient. Between Chicago and Waukegan, a distance of about 35 miles, the territory is closely built up. Although there are a number of separate municipalities, for transportation purposes it is almost a continuous city, making more frequent service and more stops necessary. To meet this condition a half-hourly express service was put in effect. This is distinct from the limited service, although the latter is available also for travelers between Chicago and Waukegan, if they prefer it. This schedule provides a service of three trains an hour in each direction, besides a convenient local service.

Although this service was more than the traffic at first justified, it was maintained and soon the people began talking of the excellent service the road was giving. The sentiment gradually changed, and from hostile critics, the people along the line became enthusiastic boosters.

As through travel between Chicago and Milwaukee increased, the management decided that an even faster service should be given through travelers and three extra trains in both directions were recently put into service,

Line, it was found possible last September, when time schedules were being revised, to cut down the running time between Chicago and Milwaukee by five minutes. The fast time made by trains, combined with their frequency, is the biggest factor in the popularity of the company. With forty-six limited trains operating daily between Chicago and Milwaukee travelers do not have to seek other means of transportation because of inadequate service.

EQUIPMENT MUST BE MODERN

The foregoing brief sketch of the character of service given by the North Shore Line, is intended to show that adequate service is essential if popularity is to be achieved. But the mere running of trains does not mean service, as that term is understood by the traveling public of today. The term "service" embraces many things. No matter how frequently trains may be run, if they are made up of cars of obsolete type, unsightly in appearance and uncomfortable in riding qualities, they will not meet with popular favor. If the cars are good and the roadbed in bad condition, the service will not sat-

Charts from the Brief Showing the Growing Popularity of the North Shore Line

venient. The traveler going a considerable distance, thinks first of the time consumed on the way. To suit his requirements, trains must be operated at a high rate of speed with as few stops as possible.

For the traveler going a shorter distance, perhaps only a few miles to the next city on the line, speed is not as essential as frequency of service. He expects a train to be there to take him at almost any time he may wish to go. If it is there, he will patronize it and praise the service. If he has to wait for a train, he will try to get to his destination in some other way and complain about the character of the service given by the railroad.

Under the present management conditions on the North Shore Line are carefully considered from the standpoint of the needs of the public, and train schedules arranged accordingly. Service is classified under three heads—Limited, Express and Local. An hourly limited service is maintained between Chicago and Milwaukee, schedules being arranged so that trains leave both cities every hour, on the hour. Travelers do not have to refer to a timetable. The service is frequent and convenient and hence popular.

making no stops between Evanston and Kenosha. These trains reduce the running time twenty minutes and proved popular from the first day they were put on. One of the trains is run to connect with the Twentieth Century and the Broadway Limited in Chicago, and is popular with business men in Milwaukee, Racine and Kenosha, desirous of making close connections with those trains without loss of time. Each of these trains was given a distinctive name, mainly for advertising purposes.

ANTICIPATING THE PUBLIC WANTS

It is the policy of the North Shore Line to anticipate the wants of the public and put on additional service without waiting to have requests made by its patrons. In line with this policy a half-hourly limited service was recently put on between Milwaukee and Kenosha, and although the traffic hardly warranted it, there has been a gradual and steady increase in business. The extra service is greatly appreciated by the people in the cities served, and it helps to strengthen the spirit of good will toward the company.

Although an average speed of almost a mile a minute is maintained on the northern division of the North Shore

Line, it was found possible last September, when time schedules were being revised, to cut down the running time between Chicago and Milwaukee by five minutes. The fast time made by trains, combined with their frequency, is the biggest factor in the popularity of the company. With forty-six limited trains operating daily between Chicago and Milwaukee travelers do not have to seek other means of transportation because of inadequate service.

isfy the public. If employees are untidy in appearance, careless in the manner in which they perform their work, if they do a small favor for a passenger grudgingly and only when asked, the service is not satisfactory. If ticket agents are not ready to answer correctly and promptly any and all questions asked by the public relative to service, prospective customers will turn away disappointed and form a poor opinion of the company. It is the policy of the management of the North Shore Line to see that no detail is overlooked to make riding pleasant and agreeable. Every item which enters into giving service, in the broadest sense of that term, is carefully checked and made as nearly perfect as it is humanly possible to make it.

IMPROVEMENTS IN TYPE OF CAR

Owing to the steady increase in business, it has been necessary for the North Shore Line constantly to keep adding to its equipment. Within the last year seventy-five new cars have been put in service, thirty-five of which were gondolas, fifteen merchandise despatch, twelve one-man safety cars, one line car, one dining car, two parlor-observation cars and nine steel coaches.

Marked improvements have been made in all the passenger cars over cars of similar type put in service as late as two years ago. The improvements are the result of careful study on the part of the company's engineers, based on experience, and conditions peculiar to the property. Passengers are quick to notice the improvements and remark that the company is always doing something to add to the comfort of its patrons. Good equipment is conducive to goodwill.

HEATING AND VENTILATING

Proper heating and ventilating of cars are essential to the comfort of passengers. In those respects great improvements have been made in the latest type of coaches put in service by this company. Each car is equipped with a double system of heating, one consisting of a large water heater with circulating pipes, and the other of electric heaters of 630 watts capacity, each with thermostatic control. The electric heaters are used in the spring and fall, when weather conditions do not warrant the operation of the hot-water heaters. In extremely cold weather the electric heaters can be used in conjunction with the hot-water heater, if they are necessary to keep the cars comfortable.

For ventilation each car is equipped with one automatic intake and eleven automatic exhaust ventilators. The air from the intake ventilator is passed over the hot-water heater pipes before entering the car body. The electric lights are in the ceiling in large bowls giving a soft and well diffused illumination to the car. The dining cars are equipped with wall lighting fixtures, mounted on the panels between windows, in addition to the ceiling lights. Each car is provided with storm windows and with screens, and has three oscillating fans. Special attention was given the interior finish and fittings, so that the cars would be attractive as well as comfortable.

PARLOR-OBSERVATION CARS

Two parlor-observation cars were placed in service in July, 1923, the first of the kind introduced on the North Shore Line. These cars have a seating capacity of 29 passengers, including the smoking compartment. They are equipped with the double system of heating used in the new type coaches, each car having twenty-five electric heaters of 500 watts capacity and a hot-water heater with circulating pipes. The ventilating system is the same as in the new coaches. The car interiors are finished in mahogany, rich and pleasing in appearance. The seats consist of large mahogany armchairs, upholstered in fine figured plush, the arms arranged to hold a small tray on which soft drinks and light lunches may be served.

That such comforts are appreciated by travelers was shown the first day the cars were put in service. Although an extra charge of 50 cents is made on these cars, they have been filled to

capacity on every trip, indicating that the public will gladly pay for special service.

During the last year the management decided to extend the service by means of motor coach lines into territory without adequate transportation facilities, through tickets being issued

Charts Used to Show How Good Service Given Shippers Brings Increased Tonnage

good for both rail and bus lines. A fleet of twenty-seven company-owned motor coaches is now operating on four routes, additional ones being rented for special days when business is unusually heavy. In line with the established policy of having the most attractive equipment that can be obtained, four types of coaches are being used by the company, one being a parlor coach, which is reserved for special chartered car passengers. While the motor coach lines give a local service, they are intended principally as feeders for the electric railroad.

SELLING TRANSPORTATION SERVICE

Second in importance to giving good transportation service, is selling it to the public, and in that respect the North Shore Line has been unusually successful, as is proved by its rapidly growing business and the goodwill toward the company which exists in every community along the line. The selling of service is accomplished in a variety of ways, and no way is wittingly overlooked by this company. Giving the character of service outlined above, and providing the kind of equipment described, are in themselves strong selling factors, but they must be supplemented in other ways. The North Shore Line has a highly efficient traffic department, made up of experts trained in soliciting passenger and merchandise movements. These men make regular calls on the traffic departments of all manufacturers and business houses in Chicago, Milwaukee and intermediate cities. Even beyond the limits of those cities their efforts are extended into contiguous territory, and their personal solicitation is followed up by letters, rate cards and other literature.

Tracing of shipments is done, and advice on reconsigning or final delivery is given by long distance telephone, so the customer gets the information he seeks in a few minutes. Shippers appreciate that kind of service and feel disposed to favor a company which renders it.

Invitations are extended colleges and universities to have students in electrical engineering classes make inspection trips over the road.

FRATERNAL ORGANIZATION EMBLEMS

Fraternal organizations often charter special trains when making visits to sister lodges in the territory served by this company. To popularize the service with such organizations, signs bearing the emblems of the different societies are provided by the company. These signs are so constructed that they can be illuminated at night. When a chartered train pulls into a station where the members of a lodge are waiting, with the emblem of that organization looming up on the head end, it creates a favorable impression in the minds of the members. They are surprised and pleased and comment on the thoughtfulness of the company. Many letters have been received from members of lodges commending

this feature of the service. It is just one of the small things that go to make a company popular with its customers.

In telling the public of its service, the North Shore Line advertises extensively in a variety of ways. Newspaper space is used regularly each week in all the daily and weekly newspapers in the smaller cities along the road. In Chicago and in Milwaukee, two newspapers are used each week, the schedule being arranged so that all the newspapers are given an equal number of lines. Space is taken in eighteen foreign-language newspapers in Chicago and Milwaukee alternate weeks. Car cards are placed in surface cars in Milwaukee and in surface and elevated cars in Chicago. Painted bulletin boards and posters are used, moving pictures, summer folders, and various kinds of literature.

ARTISTIC LITHOGRAPHED POSTERS

No form of advertising adopted by the North Shore Line has attracted as much attention, or caused as widespread favorable comment, as the lithographed posters used in the last year. These posters follow the idea of the London Underground System. They depict points of interest on the line and allow the picture to tell the story. Requests for copies of these artistic posters have come from universities and colleges all over the country, from public and private schools, church organizations and art schools. They have attracted the attention of magazines devoted to art, and the art departments of metropolitan daily newspapers. They are being used in the class rooms of high schools in Chicago and other cities and in a number of colleges. Art directors as far removed as the University of Washington in Seattle, read of these posters and wrote for copies to be used in class rooms. They are the work of well-known artists in Chicago, each one a specialist in a particular line.

PAINTED BULLETIN BOARDS

Another form of advertising which has attracted a great deal of attention and helped to popularize the North Shore Line, is the large painted bulletin boards, placed at carefully selected locations on automobile highways, junction points of railroads, and thickly settled sections of Chicago and Milwaukee. Like the posters, most of these bulletin boards let the picture do the talking. For example, one board placed on Chicago's principal boulevard, depicts an electric train racing with an aeroplane. It requires no words to convey the idea of speed. The name of the road is all that is necessary. The location of the board is such that it can hardly fail to catch the eye of everyone passing in an automobile, and thousands of cars pass the point daily. This form of advertising serves to keep the name of the company before the public.

Motion picture advertising and publicity is effective when done in a way

that does not convey any suggestion of advertising to the audience. Owners of motion picture theaters know that an audience will not stand for any kind of advertising, and the better class houses will not display such pictures under any circumstances. The North Shore Line, however, has been able to get two reels, one showing its passenger service and one showing its Merchandise Despatch into the best houses in Chicago and Milwaukee. "The Green Bay Trail" contrasts transportation in the days of the Indians with modern transportation on an electric railroad and is readily accepted by theatre owners as an educational film. The only advertising is the name of the railroad shown on the cars, which was enough. "The Pace of Progress" depicts the advancement in methods of handling merchandise shipments since the days of the trapper, and follows the story up by showing an actual shipment from Chicago to Milwaukee in two hours and twenty minutes over the North Shore Line.

MINIATURE ELECTRIC RAILROAD

A miniature electric railroad with two four-car trains, one a passenger and the other a merchandise despatch, giving a panoramic view of the route of the North Shore Line from Chicago to Milwaukee has been used with good effect at several expositions held in the last year. The miniature cars are exact reproductions of the regular equipment and run electrically, causing a great deal of comment and helping to sell North Shore service.

COURTESY OF EMPLOYEES

Every employee of the North Shore Line who comes in contact with the public is a salesman of the service and helps to popularize the road. The employees take a personal pride in the railroad and are jealous to see that their work comes up to the high standard set by the management. This attitude of the employees is a subject of daily comment among passengers, many of whom write letters congratulating the management on the high caliber of its train crews. Attentions which may seem trifling frequently make lasting impressions, and the employees of this company are ever alert and watchful of every detail which may add to the comfort of their passengers.

SATISFIED PATRONS GOOD ADVERTISERS

Among the many factors which contribute toward the popularity of the North Shore Line, not the least important are its patrons. Many traveling salesmen are regular patrons of the road. They talk about it on their travels and induce fellow-travelers to give it a trial. Letters written to the editor of the *North Shore Bulletin*, show that the road has been the subject of discussion in hotel lobbies in Minneapolis, in Philadelphia, in Kansas City and even in Toronto and Montreal, Canada. It is the subject of many quips on the vaudeville stage

from actors who have been shown some special act of courtesy when traveling between Chicago and Milwaukee. This is a valuable form of advertising, given the road gratuitously by satisfied customers and has added a great deal to its popularity.

Gaining Public Good Will

THE North Shore Line enjoys in a remarkable degree the good will of the public in the communities which it serves. This pleasing result has been brought about by careful cultivation of good will in a great variety of ways.

When the present management took charge of the property, following the reorganization in 1916, the road was in a badly run down condition. It had been operated under a receivership for nearly ten years, during which time no improvements were made and only such maintenance as was absolutely necessary to keep the line in operation. Under such conditions it was natural that prejudice against the road should exist, and the new management had to meet and overcome that handicap. It made the building up of the property and the gaining of public good will more difficult than would be the case where no prejudice existed.

FIRST GIVE SERVICE, THEN SELL IT

There are many ways in which a public service company may break down existing prejudice against it and gradually build up co-operation and good will. Minor details, which taken by themselves, seem insignificant, all contribute toward the general result, but there are two things which are fundamental, without which success cannot be achieved. A company in the first place must *give* the public service, and in the second place it must *sell* that service. In both these fundamental respects, the North Shore Line has been successful.

Immediate improvement of the service was the first step undertaken by the new management. New equipment of improved type was purchased, old equipment was remodeled, roadbed improved, schedules rearranged and the service classified to suit the convenience of the travelers. This rebuilding of the property was a gradual process. It has been going on since the first day the road came under the present management and will continue to go on indefinitely, for a public service company cannot stand still and hope to be successful.

"DOING THINGS" BRINGS GOOD WILL

Public sentiment toward the North Shore Line has undergone a complete change under the present management. A new spirit has been injected into the property and the public has been quick to note the change and react to it favorably. The road is "doing something" all the time. There is nothing which arouses public interest in a company so much as to have it constantly doing something new, making some improvements here or there, showing that it is alive, and trying its best

to please its patrons. That feeling once created in the public mind, good will must inevitably follow. Even shortcomings in service will be overlooked. The public will say: "Give it a little time. It cannot do everything at once, but it is doing something all the time." The North Shore Line has convinced its patrons that its creed is service, and that accomplished, the gaining of good will is easy.

GETTING FAVORABLE PUBLICITY

Next in importance to "doing things," is telling the public what a company is doing. True, an improvement in service will soon be noticed by those who use it, but it is a good thing to call their attention to it. In this respect the North Shore Line is singularly fortunate. Few railroads get as much free publicity. Hardly a day passes that some newspaper published along the line does not carry a news story about the company. The accompanying reproductions of newspaper clippings are submitted, not for the purpose of showing how much publicity the company gets, but rather to show the variety of ways in which a company can get into public print in a favorable way. As a matter of fact the clippings represent a small fraction of the total number of stories printed in the last year, but are selected because of their variety. They show the various activities in which the company, or its employees, are engaged, and in no sense are they "press agent" stories, as that term is commonly understood.

The reason why the North Shore Line gets so much favorable publicity, is that it is constantly making "news." A glance at the clippings reproduced will show that they are not items prepared by a "press agent." That method of obtaining publicity, happily is disappearing. It is never even attempted on the North Shore Line. The policy of the North Shore Line is to make "news" and publicity will take care of itself. Newspapers, especially in small cities, such as those served by this company, are anxious to get legitimate news stories of new activities. The North Shore Line is a part of the communities it serves. Anything that it is doing in the way of improvements, anything that its employees may do in the communities in which they live, is of general interest and as such is worthy of space in the newspaper columns.

THE "NORTH SHORE BULLETIN"

As an aid in publicity work and as a medium through which to cultivate good will between the public, the employees and the company, the *North Shore Bulletin* is published monthly. This little publication has attracted a great deal of attention and has built up quite an extensive following. It has readers scattered all over the country, men and women, who have accidentally run across a copy, read something that interested them, and written to the editor to have their names placed on the mailing list. The mailing list numbers

about two thousand, a majority of whom have requested to have the publication sent them, many offering to pay for it. The issue is 15,000 monthly, distributed through boxes placed in the cars and at the various stations along the line. Every copy is carried away within a few days of the time they are placed in the cars and stations.

The *Bulletin* has proved a factor in building up good will. It serves as a link between the public, the employees and the company. A passenger who has been shown some exceptional courtesy, or received a favor from a trainman, writes a letter about it to the *Bulletin*. The letter is published in the next issue. It pleases the particular employee commended and it pleases the passenger. Another passenger will read it and it suggests the

to the *Bulletin*. Either way they make good publicity for the company.

The *Bulletin* serves as an aid to the traffic department in obtaining business. It is the practice each month to write a descriptive story of some manufacturing plant or business establishment on the line. These writeups are illustrated and are of some advertising value to the particular concern written up. They are entirely gratuitous, and tend to create a friendly feeling on the part of the concern toward the company. Requests and invitations to write up plants are sent the *Bulletin* faster than they can be complied with. Many times a firm receiving such a writeup requests a supply of copies, to mail, so in that way the *Bulletin* gets into hands it would not otherwise reach. Recently one institution requested 2,000

One of Several Posters Reproduced in the Brief

idea to him of commending some employee, or some feature of the service. Many of the letters comment on the *Bulletin* itself, but whatever the nature of the letters, the important thing is that they are written and that they serve to keep the road in the minds of its patrons.

Occasionally a letter is written the *Bulletin* criticising some operating practice which may cause inconvenience. Complaints of that character are taken up at once, the condition is remedied and a courteous reply sent to the person making complaint, thanking him for calling attention to it. No criticism or suggestion is ever overlooked. If it is not practicable to carry out a suggestion, the reasons are fully explained, usually to the complete satisfaction of the person offering the suggestion. Letters in the nature of complaint or criticism are exceedingly rare, but the management welcomes them and gives them prompt attention. An average of thirty letters a month are written to the *Bulletin*.

Another way in which the *Bulletin* is useful, is as an indirect publicity medium. Every activity of the company is exploited in it. Each month some of the newspapers along the line find something in the *Bulletin* that they consider worthy of space in their columns. Sometimes items of news are rewritten as news stories, other times they are printed verbatim and credited

copies to mail, offering to pay the cost of printing.

PUBLIC FUNCTIONS INCREASE GOOD WILL

When the North Shore Line opens a new station of importance, installs a bus line, puts into service some new equipment like observation cars, it is the custom to celebrate the event with a dinner, to which public officials, representatives of business men's associations, and newspaper publishers are invited. Several such occasions have been celebrated in the last year with gratifying results in the way of obtaining favorable publicity and strengthening the spirit of co-operation and good will. On the eve of the opening of the bus line connecting Kenosha and Lake Geneva, a dinner was given in the latter city. The mayor and aldermen from Kenosha, together with representatives of the manufacturers' and retailers' associations, met with like officials and representative business men in Lake Geneva. At the close of an enjoyable evening all pledged the new line their hearty support. The same course was followed on the opening of a bus line connecting Waukegan and Kenosha, and on the opening of the latest line between Wilmette, Highland Park and Waukegan.

These public dinners serve a two-fold purpose. They bring together the public officials of different cities with officials of the company and they make

good publicity for the newspapers. The new bus line, or whatever the particular service may be, starts out with the support of public officials and newspapers. It is an effective way of creating good will.

An improved system of ticket auditing, through which the prompt refunding of unearned revenue is accomplished, recently was perfected on the North Shore Line, and has proved an important factor in creating public good will.

When a passenger claims a refund on an unused ticket, under the new system five days is the maximum time which elapses until a check for the amount is in his hands. Usually the time does not exceed two or three days.

While this is seemingly an unimportant detail, the hundreds of letters received from pleased patrons indicate that they appreciate it. In the merchandise despatch service, refunds are made with equal promptness, many times without the shipper making any claim. When waybills are checked and an overcharge discovered, a check for the amount of overcharge is immediately sent the shipper. This promotes confidence in the company and expedites adjustments in cases where customers have been charged too little.

Economies in Operation

IN seeking to effect economies in operation, an electric railroad situated like the North Shore Line, subject to the keenest kind of competition, must consider the subject from many points of view. What may seem an economy today, may within a year prove a grave error in business judgment and bring results directly opposite to what was intended.

While the North Shore Line is steadily effecting economies in many directions, they do not necessarily loom up large on its balance sheet. They are not effected by a curtailment of the service given the public. The company operates through a rapidly developing territory. It is building up its business, and steadily creating new business.

A railroad differently situated might be able to show economy by curtailing its service. In a fully developed territory, a curtailment of service during a business slump, might prove a real economy. In a growing territory it might easily be the reverse.

Were the chief purpose of the North Shore Line to reduce its car mileage to the lowest possible point at which it might operate a service that would escape the criticism of regulatory authorities or of its patrons, it might be possible to effect an economy. But would it be a real economy? Could the company hold its patronage and increase it, if it allowed its trains to be overcrowded through insufficient service? If part of its patronage left it for other competing means of transportation, would a restoration of service bring back that patronage? Would its patrons continue to praise the service and recommend it to others?

The policy of the North Shore Line is one of strict economy, but not at the expense of the public. The management feels that the good will of the public is the road's greatest asset and it fosters and guards that good will jealously. If the gross earnings justify a measure of service better than sufficient to escape criticism, the management believes the public should have that service, even if it means somewhat less net revenue to the company. For the North Shore Line that policy appears to be real economy.

AUTOMATIC SUBSTATIONS

Extensive use has been made of automatic substations in expanding and raising the efficiency of the power distribution system and reducing operating expenses. The first installations were made at the time when this type of station was in its early development stages, and these installations were of material help in the development of apparatus, and demonstrating its applicability to heavy traction work, thus benefiting the industry as a whole in paving the way for greater efficiency in power distribution.

Since the first installations were made stations have been added from time to time until we now have seven in service. Six of them are new stations added to the system; one was a manually operated station to which automatic control equipment has been added, and we are now completing the changeover of a second manually operated station to automatic which will bring the total up to eight.

Considerable progress has been made in developing outdoor type power transmission apparatus which has aided in reducing cost of substation installation, due to reducing size of buildings. We have taken advantage of this development and in our latest substation have placed all high tension apparatus outside the building with a resultant reduction in first cost and fire hazard.

Extensive application of automatic substations has made it desirable to develop some means of supervisory control so that a dispatcher at a central point would know whether or not stations were operating and also make it possible for him to control these stations. This problem differs on an interurban property from an urban property and requires a different solution. We have done a great deal of experimental work with such a system and through the co-operation of the manufacturers we have developed one which gives good results with a minimum of equipment and expense.

As better and more efficient protective apparatus has been put on the market for power systems we have applied them where economy and elimination of service interruptions would result, thus keeping our system up to the highest possible state of efficiency and reliability.

The tendency of the times in power generation work is to standardize on a frequency of 60 cycle for all kinds of power work, eliminating all other

frequencies as they tend to duplicate investment in station and line equipment. This changeover is being actively followed by the power companies from whom we purchase power, and in spite of the fact that our long term power contracts call for furnishing 25-cycle energy we are co-operating in the movement by installing all new apparatus with 60-cycle equipment even though it entails considerable inconvenience, additional expense and temporarily some duplication of transmission lines. The results to be obtained from this progressive policy can not help but be of benefit to the industry and the public at large in reducing the cost of service.

REDUCTION IN POWER CONSUMPTION

Believing that the greatest economy can be had only by careful analysis of all items which enter into cost of rendering service, power recording meters were installed on all passenger equipment and accurate records kept of power required per car mile in all classes of service. The reduction in energy consumption which followed the installation of this metering equipment was due to several causes, but each of the steps taken to accomplish results were studied with the aid of these meters.

Some of the factors entering into a reduction in power consumption are:

1. Careful coaching of motormen in proper operation of trains.
2. Substitution of new, lighter and more efficient car equipment.
3. Study of effect of using proper type of equipment in various classes of service.
4. Study of effect of properly balancing up motor and trailer cars in various classes of service.
5. Establishment of a number of non-stop limited trains.
6. More scientific basis of making up schedules and elimination of stops wherever possible, especially at times of peak load extra service on heavy days.
7. Enlarged terminal track facilities in Chicago which made it possible to avoid interference from local transportation system, thus eliminating unnecessary stops and slow downs.
8. Substitution of one-man cars for heavy two-man cars in Waukegan and Milwaukee.
9. Improvement in average line voltage making it possible to do more coasting.

ECONOMIES OF ONE-MAN CARS

Installation of one-man safety cars in the city of Waukegan, where the North Shore Line supplies all the local transportation service, and later in Milwaukee, where this company furnishes a portion of the local service, has resulted in greatly improving the service, increasing the number of passengers carried and reducing the cost of operation.

At the time the one-man cars were introduced in the local service in Milwaukee, February, 1923, a ten-minute

The Kenosha passenger station was opened to the public less than a year ago. An increase in business at that point was noticeable immediately after, and it is steadily growing. The station is a standing advertisement for the company.

Business conditions at Kenosha made a new station imperative. Traffic had outgrown the former station. A less pretentious station, however, might have met the requirements for several years. But the management decided that capital invested in a station that would stand out as a distinctive landmark and be looked upon with pride by the local community, would pay returns. The results have fully justified that decision.

The building is a handsome structure, the walls being pressed brick, with three-quarter inch raked joints, cast concrete trim, massive concrete pillars and a glazed tile roof. The station is equipped with all the con-

ballasting its roadbed over the entire system, more than 60 per cent of this work being completed. The best equipment will not ride smoothly over a poor roadbed.

Heavy rails add to the smooth riding qualities of a train and the North Shore Line is replacing all light rail with 100-lb. rail on the main line and on some of the city streets with 116-lb. rail.

In the city of Milwaukee a new type of chrome nickel crossing has been installed at a number of locations. These crossings are made of much harder material than the ones they replaced, and being cast in one piece, the shifting or loosening of sections is eliminated.

MAKING IT EASY FOR AUTOISTS

Hundreds of automobiles daily cross the tracks of the North Shore Line. In the belief that smooth crossings create a friendly feeling toward the company on the part of the public, a

Records show that the settlement of personal injury and property damage claims amounts to 1.82 per cent of gross earnings. In the year 1922 the company had one accident for every 16,081 car-miles operated. When it is considered that record is made of every accident, no matter how trivial; that the road operates through a territory in which automobile travel is heavy, with many grade crossings; that trains constantly are run at a speed of 60 miles an hour and upward, the record speaks for itself.

Safety work on the North Shore Line is not occasional and spasmodic. The safety department of the road is thoroughly but simply organized, under systematic plans which assure continuity of effort. It is required to operate with the same exactness as other departments. The management, supervisory forces, and in fact the entire organization of the company, recognize the safety department as having the

Curve Showing Reduction in Energy Consumption Accomplished by Various Means Noted in the Brief

veniences of a modern railroad station, lunch counter, women's rest room, newspaper and magazine stands, shoe-shining parlors, etc.

The grounds surrounding the building are spacious, and here artistic flower beds have been laid out, winding footpaths, ample parking space for automobiles and for company buses, which connect with the main line at this point. It is looked upon by the citizens of Kenosha with pride and is pointed to as one of the show places in the city. The importance of that in the way of creating good will cannot be overestimated.

MAKING SMOOTH RIDING

In these days when travel on rubber tires is the popular fad, when luxurious motor coaches and automobiles are competing with railroads for public patronage, the electric railroads must exert all their energies toward making travel fast, safe, smooth and comfortable. They cannot afford to overlook a single detail in the matter of equipment, roadbed, or, in fact, anything which enters into the operation of a railroad.

With this thought in mind, the North Shore Line is constantly striving to make improvements. It is now rock-

new type of crossing has been placed in use that has been the cause of many favorable comments. It consists of a composition made of graded sizes of limestone with screenings and Headley road oil. Long rails were laid at crossings so as to eliminate joints. The result is that these improved crossings make as smooth riding as cement roads.

Wood platforms are being replaced all over the system. At the more important stations concrete and brick platforms are being substituted, but at the smaller stations a new type has been developed and made standard. It consists of a fill with cinder base and a top dressing of fine limestone screenings, bound by a curbing of 4x12 creosoted timber. The hazards caused by loose boards and nails are removed and there is less danger of ice forming on this type of platform.

Accident Prevention

THE Chicago, North Shore & Milwaukee Railroad is frequently referred to by its friends the "the safest high-speed electric railroad in the country." Whether or not this claim can be substantiated, it cannot be disputed that the North Shore Line has done, and is doing, excellent work in the way of accident prevention.

same status in operation as other operating departments.

Since the North Shore Line was brought under the present management in 1916, it has constantly engaged the services of the Bureau of Safety, a well known organization specializing in the safety of public utility operation. In the last year, however, it has supplemented this service by the employment of a trained director of safety, who devotes all his time to accident prevention. The Bureau of Safety continues to give consulting service and constantly keeps some member of its staff working in co-operation with the safety director.

COMMUNITY SAFETY WORK

The work of accident prevention on the North Shore Line is not confined to employees. The company is active in community safety work in the territory which it serves. Several active community safety organizations have been formed in the last year as a result of the influence and assistance of the company's safety department. Each year the company provides the public and parochial schools within the territory with lectures on safety, paying the expenses. Illustrative of the scope of this work the records show

that between March 1 and July 15, 1923, 570 such lectures were given before 22,548 pupils. It is difficult to distinguish between the value of the safety work within the organization of the road and that to the public, but on a property like the North Shore Line, it is essential that the public as well as the employees, should be educated.

EDUCATING THE PUBLIC

In addition to conducting lectures in the public schools the North Shore Line prints many safety posters and cards which are displayed in classrooms, libraries and other public gathering places. This summer the company had a number of decalcomania labels printed which are used on the windshields of all automobiles driven by officers or employees of the company reading: "This car stops at all railroad crossings." These labels attract a good deal of attention and suggest the thought to other drivers to do likewise.

During the year 1922, 152 safety meetings of employees' groups and committees were held. At these meetings 884 safety recommendations were submitted, 707 of which were approved and carried out. Inviting suggestions from the employees themselves and acting upon them promptly stimulates their interest in the work, and assures their co-operation.

SAFETY EDUCATION OF TRACKMEN

Most of the meetings of employee groups are held after their day's work, the meeting places being arranged to best suit the convenience of the men, but in the case of track laborers, who are scattered along the entire road, this method was found to be inconvenient and it was difficult to get full attendance. To overcome this difficulty the North Shore Line devised a plan, which it is believed is not used on any other railroad. A passenger car, of the older wooden type, was fitted up suitably for safety meetings. The safety car makes periodical trips along the line, picking up the track laborers at the point they are working. It is then run on to a sidetrack where a meeting is held, the safety director, or a representative, giving the men a short talk on safety measures. At the close of the meeting the men are taken back to their working places and the car proceeds to the point where the next gang is at work. Through this plan a full attendance is assured at each meeting as the men are paid regular time for their attendance.

FIRST AID DRILL TEAM

First Aid is closely allied with safety work. While the aim of safety work is to eliminate accidents among employees, it need not be expected that full realization of that aim can be achieved. Prompt medical assistance, when an accident does occur is essential, and this the North Shore Line provided in 1922 by having the medical department organize a First Aid Drill Team.

The First Aid Drill Team, composed

of twenty employees, carefully selected and given a thorough course in first aid work, has demonstrated its value to the road in a number of ways. Members of the team are expert in applying artificial respiration in case of electric shock through the Schafer prone pressure method, they know how to stop a flow of blood, apply splints and bandages in case of fracture, and give other emergency relief measures, pending the arrival of a surgeon. As a result of this knowledge and prompt application of medical skill, the time

is a good medium through which to advertise the road and cultivate friendly relations with its customers. The team has been called on to give many demonstrations before chambers of commerce, business men's clubs, etc., and these exhibitions keep the name of the company constantly before the public.

WOMEN'S FIRST AID DRILL TEAM

So successful have been the efforts of the First Aid Drill Team in stimulating interest in safety work and im-

North Shore First Aid Drill Teams

lost by employees meeting with an accident has been materially reduced and much suffering avoided.

Knowledge on the part of the employees that there is always one or more members of the first aid team near at hand, has a tendency to strengthen the morale of the entire force. The policy of the company is to rotate the members of the team at stated intervals, so that eventually all employees will be given this instruction.

Aside from the practical value of having such a team available in case of accident, the First Aid Drill Team

proving the morale of the working forces, that recently a number of women in the general offices requested the director of safety to give them instructions in artificial respiration and other simple emergency measures. They volunteered to give their time evenings while taking the course of instructions, and a team was accordingly organized.

This being a novel departure, good feature stories were printed in all the newspapers along the line with large pictures showing the girls in action. In this way a great deal of favorable publicity was obtained for the company.

Development of Good Relations Between Management and Employees

FRANK and open dealing with employees, is the characteristic policy of the management of the North Shore Line. The aim of the management is to make each employee feel that he, or she, is an important part of the organization; that the company is *his* or *her* company; that the future of each employee depends on the success of the company; that all are one family whose purpose is to give the public a service that will insure continued successful operation and consequent steady employment.

In departments in which the employees are organized in unions, the principle of collective bargaining is recognized, and wages and working conditions are established through joint conference. In other departments where no union organization exists, a liberal policy is followed, under which wages and working conditions are made as agreeable to employees as is consistent with management of conservative type.

That this policy is successful is shown by the fact that the North Shore Line, under the present management, has had no labor difficulties to interfere with its continuous operation. That there exists a spirit of co-operation between the management and the employees, has been proved in many emergencies, such as severe snow storms or other unusual and unforeseen circumstances, when all employees have worked night and day, without a murmur, in order that trains might be kept moving without interruption and the public given the service to which it has become accustomed.

Further proof of a spirit of co-operation might be shown in hundreds of letters from patrons of the road commenting on the good work of employees, and commenting on their courtesy and helpfulness to passengers.

EDUCATION OF EMPLOYEES

In line with the policy of frank and open dealing with employees referred to, the management of the North Shore Line believes it essential to give every employee an opportunity to become acquainted with, and to understand the business principles which govern every corporation. Employees in the transportation department of a comparatively small railroad like the North Shore Line, see trains well filled with passengers, or other evidence of seeming prosperity. Unless they understand something of the business end of the enterprise, something of the financial problems with which every corporation has to deal, they are apt to form erroneous impressions, which tend to produce unrest and discontent.

With that thought in mind and with the desire to have all employees of the North Shore Line familiar with the business end of the company, the management engaged Ralph E. Heilman, dean of the School of Commerce of North-

western University, to give a course of ten lectures covering every phase of public utility operation. These lectures were given during the winter of 1922-23, and while it was impossible for all employees to attend them, most of those employed in a supervisory capacity attended and learned a great deal about the business of the company. The fact that the lectures were given by a well-known instructor and authority on such subjects, who had no direct connection with the company, and whose views were in nowise influenced by the company, made them more valuable and convincing than if given by anyone connected with the company.

FINANCIAL ASSISTANCE GIVEN STUDENTS

As a result of the Heilman lectures quite a number of employees wished to take courses in English, mathematics, electricity, etc., at Northwestern University, or other educational institutions, to advance themselves in their particular fields of endeavor. This laudable ambition was encouraged by the management and announcement made that all employees who took extension courses at any educational institution, would have one-half the tuition fee refunded them by the company upon presentation of proof that they had completed the course. A number of the employees are now taking such courses.

PUBLIC SPEAKING CLASSES

Whether due to the stimulus in an educational way of the Heilman lectures, or some other cause, employees of the North Shore Line have recently shown a keen desire for self-improvement. One such activity was the organization of classes in public speaking. During the spring and early summer, four such classes were organized, one of them composed of women employees. The employees attending the classes in public speaking were regular attendants at the Heilman lectures. Second in importance to acquiring correct information about the affairs of the company, is the ability to impart that information to others, and the classes in public speaking are intended to supply that requirement.

EMPLOYEES' MUTUAL BENEFIT ASSOCIATION

An active Employees' Mutual Benefit Association exists on the North Shore Line, to which about 1,000 of the estimated 1,200 employees eligible to membership belong. An active campaign conducted in the spring of 1923 resulted in adding more than 200 members to the association.

The association is financed by a payment of \$1 a month per member, to which a contribution of 50 cents a member is added by the company. Liberal sick and death benefits are paid and the association in the two and a half years of its existence has built up a surplus of \$8,000, which is invested in government bonds.

The association is an important

factor in fostering friendly relations between the management and the employees.

AMERICANIZATION WORK

An important phase of the educational work carried on among its employees by the North Shore Line, is what is known as Americanization work. As in the case of all railroads, most of the men employed as track laborers are of foreign birth. Generally speaking they are illiterate, many of them being unable to read or write the language of their native country.

When it was decided that something should be done for the improvement of these men, the first step was a survey to ascertain the facts. This survey showed that of 129 alien track laborers employed at that particular time, thirty-seven could not read or write their native language, twenty-nine could not speak English at all and the others very imperfectly, eighty-two could not write English and seventy-five could not read it. Of the entire group, 101 were not American citizens and only forty-four had declared their intentions of becoming citizens.

The company at once employed an experienced man as a director of education and Americanization. Evening schools were established in buildings furnished by the company at convenient points along the line. Four classes in English were organized and later a class for foremen. Most of the men evinced keen interest in the work and within a few weeks all those attending the classes were able to write simple sentences in English. Some difficulty later was experienced in getting the foremen to attend the school. They were mostly middle-aged men and the idea of attending school did not appeal to them.

In order to overcome this objection the class was changed to a foreman's "club," which elected its own officers and conducted its own meetings. Changing the name did not materially change the nature of the class. Instruction in English continued at the club meetings, practical lectures were given on various phases of the work, and cigars and lunches were provided by the company.

RECREATIONAL FEATURES

To sustain interest in the evening classes, it was found necessary to introduce some recreational features such as horseshoe pitching contests, moving pictures, entertainments and floating libraries, the books for which were obtained from public libraries in cities along the line. This work has made a deep impression upon the men. The improvement is noticeable in the reports on work made at frequent intervals by foremen and in the desire of the men to continue in the service of the company. The "turnover" in this class of labor has shown a marked decrease since the educational work began.

In connection with teaching the alien workmen the English language, they were given lessons in American citi-

zenship. To those who had not declared their intentions, the advantages of becoming American citizens were explained. Arrangements were made with the courts in Waukegan, Kenosha, Racine and Milwaukee to receive applications for citizenship on a certain date, which was designated "first paper" day. Practically all the men eligible applied for their first papers on that day. The work was followed up and those who previously had their first papers were given assistance in becoming full citizens. This educational and Americanization work is being continued as one of the regular activities of the North Shore Line.

HOUSING CONDITIONS OF TRACK LABORERS IMPROVED

As a part of the educational work among the track laborers, an investigation was made of the conditions under which they lived in section houses. It was found that some of the section houses were in an unsanitary condition and immediate improvements were made. The company's visiting nurse was sent to the section houses to explain personal hygiene and the necessity for maintaining clean sanitary surroundings. All this work has tended to improve morale and strengthen the loyalty of the employees to the company.

PLACEMENT SERVICE

Another policy adopted by the North Shore Line which tends to promote good relations, is what is known as "placement" service. If an employee fails to make good in one position, he is placed in another and another, until a position is found where he will fit. It is the policy of fitting the man to the job. This policy is based on the theory that the ordinary human being will make good somewhere, if the proper niche for him is found. It inspires loyalty to the company, as the employee feels that he will be given every opportunity to make good.

HOME BUILDING

Employees desirous of building a home are assisted by the company to the extent of procuring plans and specifications, estimates on the cost of various materials and expert advice on the most improved methods of construction.

SERVICE COMMITTEE DEALS WITH COMPLAINTS

In March, 1923, the management created a "service committee," offering a series of money prizes to the employees who would offer the best suggestions during the year for improving the service. The thought which prompted this offer was that the employees constantly come in contact with passengers and shippers. If they should hear a criticism of some detail of operation, the management wishes them to be in a position to assure the complaining customer that the matter complained of will be attended to im-

mediately. Report is made of the criticism to the service committee and immediate action is taken to have the cause of the complaint removed. This plan tends to make the employees alert and watchful and to give them a sense of responsibility. They are made to feel that anything which affects the company is their personal concern and that the management appreciates any suggestion that they may offer in the way of improvement.

SOCIAL ACTIVITIES

The North Shore Line encourages athletic sports and social activities among its employees, providing facilities for meetings, commissary service, and financial assistance. Within the last year a tennis court was laid out. Last Spring the North Shore Line Club was organized by the employees to direct social and athletic activities.

mingle with the employees, and help to create the feeling that all are one big family.

Special Accomplishments that Reduce the Cost of New Capital

THE continually increasing revenues of the North Shore Line, which are the determining factor in the life and success of the property, make necessary large capital expenditures. Until recently, when the company completed a flexible financing plan, we were unable to obtain the required capital at a reasonable cost. However, during the war period, when obtaining capital was very difficult, the company raised seven million dollars, and the increased earnings made possible by the new capital put into the property, enabled the North Shore Company to

The North Shore Line Station at Kenosha, Wis. This Picture Was Run in the Brief with the Caption "Popularizing Service by Building Artistic Stations"

Soon after its organization the club undertook the publication of *The Highball*, a monthly paper to serve as a mouthpiece for the club's activities. After two issues of the paper, the club found the cost was more than it could carry and the company assisted by having its publicity department take charge of the publication and pay the bills for printing. Each year the employees gave a field day and also one or two theatrical performances. They have a bowling team and a ball team, a post of the American Legion, a Company Section of the A. E. R. A., and other activities. A feature of the social side is the annual reunion of employees.

The reunion is held in some large hall rented by the company and all the employees and their families are invited. It begins at noon and lasts until midnight to give all the employees a chance to attend. The company provides a turkey dinner at noon and supper in the evening. It engages professional entertainers and an orchestra. These entertainments are attended by all the officials of the company, who

improve its credit and further enhance its reputation for good service and reliability.

When the properties were acquired by the present management, there was no working capital—no power to issue junior securities, and a closed mortgage on the properties limiting the bond issue to ten million dollars, and limiting the interest rate.

The new financial structure makes it possible for the company to finance its growing needs through the sale of mortgage securities and junior securities.

The elastic financing plan will also enable the company to obtain capital for betterments at a materially reduced cost.

One of the most important features of the plan is that we will be able to maintain the proper relationship between the funded debt and the capital stock.

Another important point is the opportunity to interest consumers and employees in becoming part owners in the property through the purchase of stock.

Automobile Accidents from Transportation Standpoint*

By **Ralph W. Emerson**

General Manager
Cleveland Railway

Ralph W. Emerson

**Not More than a Fifth of
Collisions Are Due to Negli-
gence of Motormen—Safety
Instruction Is Valuable Aid
—Parking Rules Should Be
Adhered to—Better Enforce-
ment of Legislation Urged**

THE thing that makes automobile accidents so vital is their appalling increase. In Cleveland the increase was from 1,803 collisions in 1912 to 10,353 ten years later, in 1922, an increase of over 400 per cent for the period. This is typical of most properties throughout the country and out of all proportion to the variation in any other class of accidents.

The increase in the use of the pleasure vehicle and motor truck has been so rapid and the resultant changes in methods for dealing with this new problem have followed each other in such rapid succession that transportation men as well as claims men have only been able to gasp for breath and wonder what might be done to check the apparently inevitable increase in the number of collisions with autos. Consequently most efforts have been spasmodic and tended to deal with present conditions rather than to propose a scheme to cover the entire question and which would be satisfactory for a considerable period of time. The inauguration of each of the various remedies tried seemed to check the onward and upward rush of automobile accidents, but its effect was only momentary. Something was lacking.

The Safety Council has been very active in studying conditions and seeking a solution. Much constructive work has been done through campaigns of education, through bulletins and letters, and to them must be given much credit for the bringing together of the various civic interests of the community for the study of this perplexing problem. What is regarded by many as one of the most constructive activities fostered by the Safety Council is the work carried on among the school children in collaboration with the Board of

Education. Very remarkable results have been obtained in educating these auto drivers of the future and inculcating in these young minds the habit of thinking safety.

There are at present eighty-two cities having children's safety organizations. Children are interested in the work as presented in the Cleveland schools, where a text-book on safety instruction for grades one to six has been adopted. The manual provides for forty-five minutes a week of safety study in the kindergarten and the first four grades. The fifth and sixth grades have been organized as junior safety councils.

As an indication of the beneficial results of this constructive work, traffic accidents to school children reduced 50 per cent last year and "Own Fault" accidents 82 per cent. Boy Scout training now includes instructions in safe conduct at home and abroad.

What have transportation companies done within their own ranks toward combating collisions with automobiles? Many of the companies have instituted campaigns of education, reaching their men through bulletins together with talks on accident prevention and endeavoring to win the co-operation and earnest efforts of their employees by an appeal to the heart rather than to the head.

The good results which may be attained by such work will be nullified and short-lived unless followed up with strict, fair and impartial discipline. C. B. Proctor, claims agent of the Memphis Street Railway, strikes the nail on the head when he says "Safety work is important, but it is secondary to discipline, unhesitatingly and impartially applied."

In Cleveland certain rules for safe operation have been laid before the men either by bulletins or talks. A strict account is kept of each operator and for the first violation of a safety rule he is called into the office and reprimanded. For any violation beyond the first he is suspended from his work for a number of days, depending upon the seriousness of the violation. This same discipline is administered for other violations.

It is safe to assume that not over 15 per cent or 20 per cent of collisions with automobiles are due to negligence on the part of motormen, notwithstand-

ing the fact that they are driving vehicles weighing between 20 and 25 tons and upon fixed rails. In Cleveland of the 135 traffic accidents in 1922 which resulted fatally there were but eighteen in which a street car was involved and but five in which the liability rested solely upon the traction company. During the same period 124 persons were killed in motor vehicle accidents. It is interesting to note that more fatalities resulted from horse-drawn vehicles and bicycles than street cars in the same year.

One of the things which contributes to the development of such efficiency among the men is the fact that in the first place they are schooled as soon as their applications are accepted, which schooling involves instruction in the mechanical and electrical apparatus which they are to operate. It involves listening to talks by the superintendent of employment bearing directly on the automobile hazard and instructions as to the safe way of combating this hazard on the street.

After ten days of breaking in under competent instructors these men are then assigned to runs and from that time on they are put on their own responsibility, with the exception that they are under the watchful eyes of the chief instructors whose duty it is to ride their cars in citizens' clothes and observe the work of the operator. Should these new men show evidence of carelessness, nervousness, indifference or unsafe practices of any kind the chief instructor makes himself known to them and shows them wherein they are wrong.

Up to this time the new employee is more of a liability than an asset. The company has spent time, money and effort to enable him to acquire himself creditably in his new work, and in return we expect these new employees to render careful, faithful service to their employer. Probably 85 per cent of all employees will do this. The other 15 per cent represent that portion of our organization which gets us into trouble through accidents, and for that reason strict discipline must be applied and a final effort made to win these men over and make them good employees, not only for the safety of others but themselves as well.

If we assume that most automobile drivers are careful to begin with, we have only to deal with a small minority who persist in unsafe and reckless driving. It might be wise and beneficial to have established in the municipality or state a school of instruction, attendance at which would be compulsory for those who by their records show themselves to be incompetent drivers.

It seems to me that the administration of the same kind of discipline to these drivers as is meted out by traction companies to their employees would go farther than any other agency in cutting down the number of preventable accidents. If the municipalities would come to the realization of the importance of disciplining the reckless without fear or favor and let it

*Abstract of a paper before the annual convention of the American Electric Railway Claims Association, Atlantic City, N. J., Oct. 8-11, 1923.

be known that there is no escaping through friendship, pull or even worse, the administration of our traffic courts would be respected by the careful driver and law-abiding citizen and equally feared by the careless.

In Cleveland we have been very fortunate in the operation of a highly efficient traffic court. During the administration of Judge A. R. Corlett, who pioneered in sentencing speeders and reckless drivers to the workhouse, this court was put on a firm, business-like and impartial basis. The fact that these sentences were meted out without fear or favor, regardless of political affiliation, friendship or any other consideration, soon caused public sentiment to rally to the support of Judge Corlett's policy. Whether or not we favor the imposition of workhouse sentences, the fact remains that the inauguration of this means of combating the reckless and intoxicated driver has done much to eliminate the small portion of automobile drivers guilty of such offenses. In 1922 of the 13,326 arrests for violations there were 12,557 convictions, or 94.22 per cent. In the first three months of this year the ratio of convictions to arrests is 96.65 per cent.

A careful analysis of data collected throughout the country reveals the fact that the percentage of accidents to motor vehicles operated is steadily decreasing. For instance, in the year 1922 in Cleveland there was a reduction of 21.6 per cent in accidents per thousand motor vehicles over the year 1919. To put this in another form, in the city of Cleveland there was an increase of 68 per cent in licensed automobiles in the four-year period 1919 to 1922 inclusive, yet in the same period automobile collisions with street cars increased only 28 per cent.

There are several causes which may have contributed to this favorable showing. Drivers are more familiar with their cars and know better what they can and cannot do with them. They are more experienced due to the longer period of time over which they have operated automobiles. They have been influenced more or less by accident prevention propaganda. They are influenced by the increased severity of discipline meted out in our courts and, lastly, the accident rate has been decreased by reason of the fact that automobile congestion is becoming more acute day by day and drivers are forced to operate their cars at a lower rate of speed, thereby being better enabled to make a quick stop when emergency arises.

This lower speed at which autos have been forced to operate is probably the principal reason for this decrease in the accident rate. By the very force of their own numbers they are helping to solve the problem of accidents. This will continue until the saturation point has been reached—whatever that is.

This phase of the question is an encouraging one to the claims man rather than a discouraging one. It shows that education, discipline and the other fac-

tors enumerated are surely cutting down not only the accident rate but the severity of the accidents which occur.

The problem of the operating man, on the other hand, is becoming increasingly difficult. His duty is not only to transport passengers safely but also expeditiously. If we wish to retain the patronage of that portion of the public which uses street cars as a means of transportation, there must be no decrease in the speed with which we deliver them to their destination.

How is this to be accomplished? Obviously, one solution is the separation of traffic by creating "street car streets" and "automobile boulevards."

Undoubtedly our larger cities, at least where physically possible, must come to the separation of traffic by the establishing of auto boulevards. This problem is now up in Cleveland, where the saturation point has been reached on many thoroughfares. The creation of main thoroughfares whereon street cars as well as autos have the right-of-way is another means of enabling transportation companies to render rapid and efficient service safely.

The Ohio State Legislature at its last winter's session passed a uniform traffic law which became effective July 26 of this year. This co-ordinates the conflicting rules of the road in various communities. Section 6,310 reads as follows:

For the purpose of enforcing the road regulations referred to in this chapter, the main thoroughfare shall be understood to mean all sections of public road and highways on which street cars or electric cars run.

Vehicles and street cars going on main thoroughfares shall have the right of way over those going on intersecting thoroughfares.

A vehicle joining the flow of traffic on a road or highway from a standing position, an alley, a building or private property, shall yield the right of way to all other vehicles.

Thus we have some relief from collisions occurring at intersections where the responsibility has heretofore been equally divided.

Another condition which introduces a serious hazard and interferes with the maintaining of schedules is the parking of automobiles in the congested sections.

The writer has attended meetings of the traffic committee founded by the city council and composed of representatives of the various civic institutions and organizations. One of their meetings was devoted entirely to a discussion of downtown parking. The only thing the committee agreed on after a long and arduous meeting was that this matter should be left alone. It was suggested by the writer, in order to start discussion, that all parking of automobiles should be prohibited upon every downtown thoroughfare upon which a car line operates. Representatives of the wholesale merchants, retail merchants, taxi drivers and various other organizations presented their arguments why this should not be done. The only personal satisfaction which resulted from this meeting was a statement by the secretary of the Cleveland Automobile Club, who was also chairman of the meeting, that he believed

that ultimately this would have to come, but that the suggestion was premature by a year or two.

We do have in Cleveland a traffic code which prohibits the parking of automobiles on certain main thoroughfares on the city-bound side in the morning from 8 a.m. until 9:30 a.m. and on the out-bound side between 4:30 p.m. and 6 p.m. This is intended, of course, to give the full width of the street for the use of moving vehicles.

As a matter of fact, parking in these hours is not less than any other hours of the day.

The provision of one hour parking on certain streets in the congested districts means nothing so far as accelerating the movement of traffic is concerned. A satisfactory, expeditious and safe movement of street cars and traffic in the busy, congested sections of our cities must ultimately do away with the use of these streets as a public garage and the time is coming, if it is not already here, when merchants must realize that their business will be enhanced rather than retarded by the quicker movement of customers to and from their stores and the ease with which they may reach the sidewalk after alighting from their automobiles or street cars.

At the last session of the Ohio State Legislature another bill was passed which we feel has been a distinct step forward, particularly in protecting the investment and the very life itself of interurban properties, namely, "the motor truck and bus law of the state of Ohio." This bill empowers the Public Utilities Commission to supervise and regulate each motor transportation company, whether passenger or freight, to fix, alter and regulate rates; to regulate service and safety of such companies; to prescribe safety regulations and designate stops for service and safety on established routes; to require the filing of an annual and other reports and to provide uniform accounting.

The fee charged by the state runs from \$40 per year to \$230 per year, depending upon the number of passengers carried. Trucks carrying freight and express are listed on a tonnage basis, the yearly fee running from \$40 to \$200.

The operation of this law will drive out the irresponsible and careless operators, and to that extent reduce the hazards of the road. There is nothing in this bill, however, which limits the size of trucks.

The ultimate solution of the problem of automobile transportation and the curbing of accidents which result therefrom will require a great many years for its fulfillment in most of our communities. In our large communities it will require city planning for the reason that our streets, as laid out, were never intended to be taxed as they are at present. It is going to mean the establishment of more thoroughfares, which provide for the proper separation of the various means of transportation.

The problem confronting our mu-

municipalities is not only to deal with the problem as it now exists and to furnish remedies which may for a short time relieve a bad situation, but at the same time they must plan on a larger and more comprehensive scale which will meet the requirements of the road imposed by the universal use of the automobile, whose numbers have increased in five years from 6,000,000 to more than 12,000,000 in the country.

In the meantime, all that we can do is to follow up, possibly a little more systematically and thoroughly than we have in the past, the choice of our employees, their thorough and painstaking education, promulgation of accident prevention work, etc., but also not to lose sight of the fact that old-fashioned discipline, fairly and impartially administered, will do more for curbing

automobile accidents than all the various theoretical methods that have been suggested.

On the part of municipalities, more strict enforcement of the existing traffic laws, which will no doubt require the employment of more men in the traffic departments, which are woefully and universally undermanned, rather than the passage of more legislation, which will be equally helpless without the man-power to enforce it, and for them to work out a harmonious relationship such as we have in Cleveland between the courts, the police prosecutor and the police department, administering the same fair and impartial discipline to the reckless and intoxicated automobile drivers which we are trying to administer in the operation of our street cars.

case in his court because the express companies had declined to furnish the information as to costs as asked for by the commission.

Bookkeepers are not necessarily accountants, and it is only in comparatively recent years that the fundamental importance of careful accounting has been recognized. Good accounting is a careful record of essential facts of business operation, the essential operating facts necessary both for the operator of a public utility and the regulator; the recording of essential facts and not the management of property. The absence of proper accounting in the early stages of railroad development proved a serious handicap to the Interstate Commerce Commission. Many of the earlier records were entirely lost or, through their indefiniteness and unreliability, were misleading or worthless.

When I was a boy I became interested in the annual reports of railroad companies to state and Federal commissions. I was early impressed with the accuracy of the figures presented and with my utter inability to find a story in them. It was amazing how little the accountants knew of details necessary for a regulating commission to know in order properly to fix rates or otherwise perform their functions as required by law, and what a vast storehouse of knowledge of details these same accountants became when they wanted to use such details in fighting some action of the commissions in the courts. They could not say what proportion of business done was state and what portion interstate while a state commission was attempting to fix a rate, but could afterward tell the court what a sorry job the state commission had made of it by fixing the rates it did, and prove their claims by endless detailed statistics. It is this sort of professional expert that has caused the public to discredit statements made by the accountants for public utility companies.

A regulating board, whether city or state, in order to make its orders stand the test of court procedure, must fix rates based upon cost of service, including a reasonable return on the value of property used in public service, and including a sufficient charge to provide for the cost of retirement of equipment. Cost figures should be actual and some of the cost figures will not be easy to ascertain, and will change from year to year and be different for different localities and different companies. No accountant for a utility company should be party to any system of bookkeeping or accounting which would permit of unreasonable use of the funds of the company or an unreasonable statement of operating conditions.

Public regulation has come to stay. It must be along reasonable lines, in the public interest, and founded on a complete knowledge of practical requirements of regulated industry. Regulation along these lines will do away with the possibility of government or

The Utility Accountant's Obligation to the Public*

By Dwight N. Lewis

President National Association of
Railway and Utility Commissioners

While Accounting Work Is Seldom Spectacular, It Is Indispensable to Proper Utility Regulation—Accurate Figures Can Help in Combating Demagoguery

FIGURES are such soulless things, in and of themselves, that it takes a real genius to so clothe them with spiritual attributes that they become alive, attention-compelling and decidedly interesting. It is recognized now that not only do figures not lie, but the man behind the figures must play fair with the arrangement of them. To be sure, there may yet be found those who, for a present advantage, will distort accounts so that the figures presented do not tell the story as it should be told. There are yet those who, for the purpose of befuddling an issue, might, instead of saying two plus two equals four, put it something like this—78 plus two divided by four squared minus three plus two equals four. Correct, sure, but the general public would have little knowledge of what was going on.

Accounting work is seldom spectacular, though I must confess I have seen some wonderfully spectacular figures coming out of the smoke funnels of utility accountants' engines. Upon you men devolves the duty of so keeping accounts that the owners and managers of the property may know, day after day, the actual results of operation. Upon the care with which you properly allocate operating expense, interest and other items of expense to various divisions of the work depend proper readjustments for the betterment of serv-

ice and the introduction of economies in operation. The public knows little of you or your work. You are like the guards in a football game—we know they're there and most mightily necessary in every play, but it's the backfield or the ends who get the applause or condemnation. I have heard times without number criticisms on the side line (may have indulged in them myself) of how the quarterback or fullback or right end or left end or a halfback ought to play the game, but I've never heard a man presume to criticize a guard. Of course, the analogy is not perfect; analogies never are. We do hear that the statisticians or accountants for public utility companies so manipulate figures as to tell a story different from the whole truth. But you are personally never blamed for it—the rotten management, the dishonest Wall Streeter, or some mythical personage representing the murderous money power, is at fault—and you are merely one of the means used to deceive and defraud the public.

SCIENTIFIC ACCOUNTING INDISPENSABLE

Scientific accounting is indispensable to the proper regulation of public utility companies. This basic truth is well recognized. I have heard the late Federal Judge McPherson many times declare that a regulating body had no standing in his court, if it fixed rates or ordered service without knowing, or at least making an honest effort to learn, the various items of cost. The state of Iowa won its express rate

*Abstract of a paper before the annual convention of the American Electric Railway Accountants' Association, Atlantic City, N. J., Oct. 8-11, 1923.

municipal ownership and operation. No real student of a democratic form of government desires to see government ownership and operation.

It is the easiest thing in the world to inflame the public mind against any public utility that is monopolistic or nearly so. The utility companies upon which we are most dependent for the necessities and comforts of life are the ones to receive our severest condemnation. We always want to buy cheaper, while at the same time receiving more for our own services. We always want more service for our outgoing dollar, although we are not always so keen to render a greater service for the incoming dollar.

When a demagog wishes to ride into public office and has absolutely no attribute of mind or conscience fitting him for the office, he bases his campaign on hatred for public utilities of one kind or another. United States senators, as well as congressmen, are made by lambasting railroads, mayors, councilmen, even governors, are elected

because they declare what rotten institutions water companies, gas companies or street railways are.

A movement which is on foot now, I believe, will have a tendency to cure the worst symptoms of this form of demagoguery and that is public ownership through buying of stocks and interest-bearing securities. I am most heartily in accord with the efforts now being made by public utility companies to promote customer ownership. It goes without saying that when one owns an interest in a going concern the viewpoint changes materially as to the needs of that institution. The more we can induce the men and women of America to own something—to have property interests—the more certain we are that the red radicals will never get a foothold in our beloved republic.

In the meantime—yes for all time—you men have it within your power largely to prevent injustice being done to either the public or the utility companies by the frankness and fairness with which you do your work.

address to another and also enable him to find those who had lived at various addresses at certain times. The company should also keep an index file showing the name and address of all previous claimants, as well as an index showing all present and past employees giving their full names and addresses and the names and addresses of their references. The company should belong to at least one local index bureau or clearance house, where a daily list showing the full name and address of all claimants could be consulted when necessary, and that it should be a member of at least one index bureau of national repute.

The chief investigator should, in addition to the above, keep a record or "dope" cabinet, so called, of all things which were of great importance to his company, but of no importance to other companies. The filing of newspaper clippings at the local index bureau or in the chief investigator's cabinet is always of great assistance, for it often opens up much information of great value. The writer well recalls a case where such a clipping was used some five years after it was filed and it opened the door to information which showed that a woman had two claims at the same time, under two different names and addresses, and that she was connected in many ways with fake claimants.

The dictagraph or dictaphone may have its special field of usefulness and should be furnished by the company when necessary. The subject of photographs is too well known to require much comment here, but an expert photographer who is a practical railroad man should always be at the service of the investigator when needed, as should also an engineer, who could take measurements, make plans and testify in court later, if needed.

Declarations should be promptly obtained after entry day, and when needed, specifications filed, and when answers are received and it is fully known what plaintiff's claim is, searching interrogatories should be filed in all cases of any great importance and should be followed up until they are fully and properly answered.

Passes or identification cards should be furnished investigators so they may readily identify themselves when and wherever needed.

EXPERIENCED, CAPABLE INVESTIGATORS

The successful preparation of litigated claims is nothing more or less than a search for the truth, and to be able to do the work of a first-class investigator one must be intelligent and honest, a hard worker, and willing to pay strict attention to business, a clear, cool-headed person, one capable of sizing up all kinds of people with whom he comes in contact. He must constantly be studying his cases, the people he meets and the locality in which he is working. An investigator should always try to leave a favorable impression with those he does business with so that they will have confidence in him in the future. Even when his

The Importance of Having an Adequate System and Experienced, Capable Investigators—Complete Records of All Cases, Properly Filed, Are a Safeguard Against Fake Claimants

Edwin F. Livingston

THE two main requirements for the proper preparation of claims are (a) an adequate system and (b) experienced, capable investigators. Any system of preparing claims that tends to fix the investigator in a groove should be avoided. An investigator may do one thing day after day, but he should be flexible, physically and mentally, capable of making quick adaptations, and alert to all the possibilities of his work. In the preparation of claims a knowledge of the essentials of that branch of the common law and the statute law relating to negligence and damages as applicable to electric railway cases should be possessed and understood by those having to do with the work of preparation. It is also equally necessary and important to keep in close touch with the decisions which, from time to time, are handed down in our cases.

The investigator's work should be laid out for him in the simplest form

consistent with the proof wanted, and under a schedule which will avoid multiplicity of work and unnecessary expense. While it is desirable that the chief investigator should indicate specifically the general ground to be covered in the preparation of the case, he should not deprive the investigator of initiative or power of instituting local investigation as to any matter concerning the case which may arise during his field inquiry into the facts. Every alert investigator will find abundance of opportunity in the cases he handles for the exercise of his best efforts and talent.

AN ADEQUATE SYSTEM

The company should provide its investigating department with all practical things within reason to aid it in its work, for instance, the latest, as well as the older, directories of the cities and towns in and near which the company operates cars; also copies of new and the older voting lists, telephone books and other sources of similar information, so that the investigator before he leaves the office may be able to trace people if necessary from one

*Abstract of a paper before the annual convention of the American Electric Railway Claims Association, Atlantic City, N. J., Oct. 8-11, 1923.

work takes him to people of the "underworld" he should strictly keep his word to him. If he will do this and is a good investigator he will often be able to obtain much valuable, honest information. An investigator should be a practical railroad man and often the best results are obtained by promoting a man from the ranks of conductor or motorman. It is highly desirable that the man seek the position rather than the position the man. He should be promoted strictly on his merit for work done. A first-class investigator is not the product of one season. The man who has been in the business many years may continue to learn something about investigation. [The author then gave several illustrations from actual cases to show the difference between a first-class and a poor investigator and their value to the company for whom they work.]

To prepare cases for trial successfully, one must have first-class investigators. The investigator's job if he hopes to be successful means a great deal of hard work, each man should be paid according to the value of the work he does. Did you ever know of a first-class investigator being paid more than he was worth? I never did, but I have known poor investigators being paid more than they were worth, for a poor investigator is of but little value. An investigator's personal appearance means much and may be a valuable asset to him.

It is very important that a first-class investigator who has had a thorough experience in doing all kinds of the work and is entirely familiar with the operating department, should be furnished as a court assistant to the trial attorney. In the trial of cases this kind of a man is of great value, as he will readily grasp many a situation of which even the best of trial attorneys might not think, or might overlook. I cannot say too much in favor of this kind of a man as a court assistant, but believe the hardest of all positions for an investigator, is where he is required to do plaintiff's history work in a blind case, or where large amounts are asked and the company does not know whether the claim is an honest one or a fake case. In such cases the investigator often has nothing definite on which to work and the success or failure of the case depends on his ability to cope with existing situations and to secure the truth. To do this work well a man must be a constant, hard worker and not become discouraged when he is not able to obtain results. The whole value of first-class investigation will never be fully known, for in some cases where the whole truth is never found out the company never knew what it lost as a result of its incomplete investigation. Then, again, in the case where the fake claimant is thoroughly shown up, the investigation in many cases helps to stop other fake claims, even in some instances where claimants are waiting to see what the outcome of a certain case may be, and if it is fatal to claimant, the claim is never made.

Of course there are many cases

where the injury and nature of the accident are not, to any great extent, debatable, and such cases call for little, if any, fine investigation work, the only problem being one for the trial attorney, to see that the questions of law or fact are properly presented to the court or jury. It is largely in cases where doubt as to the happening of the alleged accident is raised or fraud suspected as to the genuineness of the alleged injury that the talents of the trained investigator are required.

It has been the experience of the writer that a man who can not only obtain statements from plaintiffs and witnesses but who can also get a record in the handwriting of the person making the statement, showing that statement is correct and that they have read it over, is a valuable man. Statements unsigned and not showing that they have been read over by claimant or witness are of but little value compared to those which have been properly taken.

Proposed Code of Ethics of the Claims Association*

Drafted by

Russell A. Sears

General Claims Attorney

Boston Elevated Railway Company

Russell A. Sears

Some of the Leading Principles Which Should Guide Claims Men and All Other Persons in Similar Positions

THE street railway is comparatively a new industry and like all conveniences of modern life brought with it some of life's inconveniences and hazards. In the early days the president, the manager, the superintendent or attorneys undertook the adjustment of claims against their railway until the unprecedented growth of this form of transportation and the alarming increase in injuries called for those of special fitting and experience to undertake the work of this character. Then was born the claims agent, who has finally, it is hoped, established himself as a respected, self-respecting and useful member of the business world. From a few dozen of them spread throughout the country in the early nineties, they have grown to hundreds, and with the influx of similar situations in all industries now number themselves in the thousands.

These thousand of claims agents have conducted their business without standardization or without a declaration of any basic principle which would seem to meet with the approval of all concerned. Believing that the time has now arrived when this association, representing one of the greatest industries of the country, whose members desire under all the circumstances to be just and honorable, should gather together some of the leading principles which should guide its members and all

other persons in similar positions, it hereby declares and adopts the following sections as its Code of Ethics:

I.

Code as Proposed

It is the duty of the claims agent to serve his company with absolute fidelity; entrusted as he must be with wide latitude of discretion in the discharge of his duties, many of which must be accepted on his unconfirmed statement, he must at all times be faithful to the interests of his employer. The nature of the business which he transacts is such that temptations toward dishonesty abound; he is subject to approach or evil suggestions from those whom no code of morals could bind; he must often in emergency act quickly and make decisions which afterthought may not confirm as wise; he may be imposed upon and misled by those of greater adroitness or who are untruthful or intentionally fraudulent. The test should be fidelity to his company under all circumstances, leaving to others the results of dishonesty, and for himself his future advancement based upon his honesty and fair dealings.

II.

The claims agent in adjusting a claim should be fair and just; while he may assume that a person of mature age will care for his own interests, the representative of the company should not by fallacious reasoning or cunning seek to reduce the claim below a reasonable amount, much less should he seek to take advantage of ignorance or inexperience. It is his duty in dealing with claimants or their representatives to disclose clearly the fact that he represents his company and never by words, actions or intimations lead those with whom he deals to believe him to occupy any other capacity than his true one. When it is apparent that the injuries were sustained through the negligence of the company and that the claimant was not at fault, the law considers the injured party entitled to proper payment. The law favors compromises and protects those attempting to adjust their differences from any prejudicial inference. Settlement should not be effected while the claimant is in pain or anguish to the extent that his mind is not clear. Adjustments made under circumstances when the claimant is not in a condition to intelligently transact business are odious and for the reputation of the company and the good name of the claims agent should be avoided, however great the temptation.

Wholly fraudulent cases under no circumstances should be compromised, however great is the expense necessary for resistance. Those guilty of perpetration or attempting to perpetrate a fraud on the company should, if the evidence warrants, be

*Abstract of a paper before the annual convention of the American Electric Railway Claims Association, Atlantic City, N. J., Oct. 8-11, 1923.

turned over to the public authorities for prosecution. This is a duty owed the community.

III.

In taking a written statement from the injured person, the injured party's statement and not that of the claims agent should be made. Such statements should be as full as desired by either party and should be honestly and accurately transcribed in writing, and the person making the statement, if he is asked to sign the same, informed of the nature and effect of the statement he is signing. The taking of written statements has often placed the claims agent in an embarrassing position, hence all precaution should be taken to surround the transaction with evidence of good faith.

IV.

When it becomes desirable to obtain the statements of witnesses, the truth only should be sought and it is the moral duty of all persons to be truthful in matters pertaining to the rights of their fellow citizens; to whom such statements are made is immaterial. A true and accurate statement should be taken and neither directly nor indirectly should any improper suggestion or intimation of reward be made by the company's representative to any witness.

V.

If a claims agent is called upon to attend court, either to assist counsel or to testify, his conduct should be deferential to court, counsel and all concerned. To attempt to curry favor with the judge, to meddle with the drawing of jurors or to directly or indirectly influence the verdict is wrong. There is very little satisfaction in a victory gained by unfair methods.

VI.

It is the duty of the claims agent who is intrusted with the privilege of employing his associates to choose men and women of good moral character. A company soon becomes favorably known if its representatives stand as men of integrity and honor in the community. No person, however alert, cunning or efficient in the business, should be employed unless this standard of character is fulfilled. When a person new to the particular company is employed to investigate or adjust claims he should be thoroughly instructed as to the policy of the company and should be required to live up to it.

VII.

In all his transactions with the company the strictest accuracy and honesty should prevail. No meretricious report, no unsubstantiated self-serving figures or accounts should be submitted. A candid report best serves the claims agent.

VIII.

The claims agent should deal only with the injured person or his properly authorized attorney or agent. To deal with one who has solicited the case from the injured person is to ignore the law and participate in an odious practice. In nearly all the states laws have been enacted against the solicitation of accident cases and in all civilized places such practice has been condemned. To recognize a person who has solicited a case by discussion or adjustment is participating in a wrong and is calculated to increase the growth of an evil situation. It is proper to discuss or adjust a case directly with the injured person without conferring with or notice to any person who has illegally or improperly procured authority to act as the injured person's representative.

IX.

When it becomes desirable to have a medical report of the condition of the injured person, only surgeons or physicians of competency and high standing should be employed. Such doctors should understand clearly that only a report of the true physical condition of the examined person is expected or desired.

Such reports, if prejudiced or unfair, mislead the adjusting authority and are to be condemned as seldom bringing even temporary satisfactory results.

X.

The reports of the accident made by the employees, being generally the starting point of the claims agent's duty, should be frank and truthful and all employees should thoroughly understand that they best serve their company and themselves by making such reports. Rules should be formulated and promulgated, according to each company's method of bringing such notice to its employees, stating clearly that the true facts only are desired in such reports.

XI.

The street railways are quasi-public corporations to the support and success of

which the public contributes its money. The return which the public has a right to expect is good service at reasonable cost. All payments made by the claims agent in the adjustment of cases are charged to the cost of service. It therefore follows that sound judgment should be exercised in these payments. Unjustifiable or over-liberal payments should be avoided. The public has a right to expect the application of sound business principles in all branches and departments of the street railway which it supports.

Even-handed justice, as far as the claims agent can see it, should be administered to all. The rich or powerful, those of political influence or holding political positions, should be treated on the same basis as those in humbler life. Pain or suffering—or the law—make no distinction as to personages.

XII.

The claims agent, having unusual opportunities to witness the effect of accidents both to the individual injured and the cost that results therefrom, should by all means in his power advocate the adoption of safe methods and practices on the part of his company and should unceasingly work with

his management in the prevention of the loss of life, suffering and money. This is one of the highest duties of the claims man and commends itself to the approval of all. He, too, has the unusual opportunity of witnessing the evils to the community resulting from the practice of soliciting personal injury cases. It is his duty inasmuch as the practice is condemned by all to do what he can to discourage the same by the advocacy of legislation or other means tending to stop it and properly to punish those who indulge in it.

CONCLUSION

In its last analysis, the duty of the claims agent toward his company, the injured person and the public resolves itself, like all human action, to nothing more or less than living up to the Golden Rule. The claims agent who transgresses the settled rules of procedure in his business offends against his company, the community and his brethren.

Construction Cost Accounts*

By **Weston J. Hibbs**

Treasurer
U. G. I. Contracting Company

Exact Principles Govern Cost Keeping—Accuracy of Results Depends on the Skill with Which They Are Applied—The Accounting System Used by the Speaker Is Described

Weston J. Hibbs

A GOOD construction cost system should function in such a manner so as to produce the following results: (1) To enable those in charge of the work to have revealed to them all the cost of the work as it progresses, so that the figures will assist in pointing out efficiencies and inefficiencies promptly and in time for remedial and productive action, thus helping to save time and money instead of simply accounting for and analyzing the outgo after it has been spent; (2) to permit readily of a financial audit; (3) to divide the various elements of cost so as to permit of an accurate detailed record of all the multitudinous parts of the work; (4) to be sound in theory and accurate in practice; (5) last but not least, not too expensive to operate, nor too difficult to keep accurate.

The fundamental principles of cost keeping are as positive and exact as the fundamentals of mathematics and every variation from these principles results in error. Accuracy of the results are predicated on the degree to which these principles are skillfully applied.

These fundamental principles may be defined as follows:

1. The Principle of Cost Definition.—

*Abstract of a paper before the annual convention of the American Electric Railway Accountants' Association, Atlantic City, N. J., Oct. 8-11, 1923.

The cost of an item of product is the sum of the expenses involved in its production and distribution up to any predetermined point. It is the price at which an article may be sold without either loss or gain to the seller.

2. *The Principle of Element Definition.*—Each cost element is definite in amount, purpose and object. An element of cost is any expense incurred. Expenses may be classified as normal or abnormal, normal expenses being those incurred directly as the result of premeditation or planning with a view of obtaining some definite result.

Abnormal expenses are incurred as a result of unpremeditated contingencies of business such as accidents, fires, carelessness, or other causes which were not definitely planned. Expenses having a single beneficiary are "direct" expenses; those having two or more beneficiaries are "indirect" expenses and require distribution.

3. *The Principle of Expense Grouping.*—Indirect expenses may be grouped for simultaneous distribution only when their benefits are measurable by a common unit and their beneficiaries participate in identical ratios. The combining of all indirect expense items in a single group and designating them as overhead, burden, or general expense, not only obscures the purposes and benefits of these expenditures but

also renders their correct distribution impossible.

4. *The Principle of Expense Distribution.*—In the distribution of indirect expenses, single or grouped, the proportions of benefits conferred indicate the proportions of the expense or expense group total, chargeable to beneficiaries. If it is wrong for a merchant to charge to the account of one customer the cost of goods delivered to another, it is equally wrong for the manufacturer to charge against an item of product made for one customer any part of the expenses incurred in production of an item made for another.

5. *The Principle of Contingent Expense.*—Contingent expenses, such as repairs to equipment, shrinkages in values, losses by error in workmanship and design, sick and absent, and vacation expenses, constitute legitimate charges against production. The causes of such expenses and losses generally serve to indicate the character of the resulting benefits or losses for the purpose of applying the rule for their distribution. This system is now in use by the company with which the writer is associated and has been brought about by the necessity and the requirements of the business.

These requirements are very severe in that most of the construction work done by the company is on some basis in which the price is determined by the cost, and that "cost" must be such a cost as will justify itself in an audit by the customer. This system has stood numberless audits and has successfully weathered all storms.

It seems to me that logically the first step of a cost system, is to define definitely "What is Cost?" There are many definitions of cost, some of which endeavor to state specifically what items constitute cost, but it has always appeared to me that for a definition of cost the best way to make it is not to say what it includes but to say what it does not include.

In our system we define cost as "All expenses incurred in carrying out the provisions of the agreement except the following: Salaries of the officers of the contracting company, purchasing expenses, new business and selling expenses, interest and legal expenses."

We exclude the above five elements of expense from our cost, because we admit our inability to properly allocate these to the various jobs and also because the question of the amounts disbursed for certain of these expenses, particularly such as new business and selling expenses, might in an audit be readily criticised.

Having determined upon our principles and definition of cost, our next step in the work is to prepare an estimate for the work. An estimate, however, is nothing more than the combination of a number of guesses of the ultimate cost of various parts of the work, and its accuracy depends on the knowledge and accurate work of the guesser. Therefore, we built up our estimates by detailing these guesses and calling each little guess or division of the work a sub-account.

Actual expenditures in the field may be divided into the four general divisions of material, labor, freight and cartage, and miscellaneous.

I show freight and cartage as a distinct division owing to the fact that this is a cost which may be very materially affected by the location of the work both as regards its surroundings, distance from points of shipments, and of deliveries.

In some cost systems only the total labor and total material costs are shown, but I personally cannot see that this information is of much value. What we want to know is what is the cost of the physical divisions of the work. For instance, what is the cost of the foundations; what is the cost of excavations; what is the cost of clearing the site?

SUB-ACCOUNTS CLARIFY RECORDS

Owing to the demands of the estimator, sub-accounts are quite numerous, but the more there are, the easier it is to compare the resultant cost with the original estimate and also to ascertain more readily the reason for over-runs and under-runs of the estimated cost. It also assists those in charge to see at a glance during the progress of the work the likelihood of each division or sub-account of the work exceeding its budget.

The usual practice is to open in the ledgers an account to represent the total cost of the job and keep memorandum ledgers showing the details of the cost divided into sub-accounts. This will simplify bookkeeping very materially and the memorandum ledgers may be kept in as much detail as desirable. If in these memorandum ledgers an explanation of each item of cost is written, a permanent record will exist for future information.

In the system I am outlining this method is followed, and at the end of each month a typewritten copy of the memorandum ledger entries made during the month is prepared for the customer so that the customer has in his office complete detailed costs and is able to compare them with the original estimate in case of an over-run or under-run.

Care should be taken by the contractor to allocate to each job such expenditures as are caused by the job and to charge to it only such expenditures. This means that the contractor's home office and engineering force should require its employees to keep time vouchers so as properly to allocate their time.

Care should be taken by the contractor to see that there is charged to the job the cost of only the work covered in the estimate. If the customer desires any work done which is not included in the estimate, it should be done under a separate job number and its cost kept separate. If you do not follow this plan it is very difficult to make comparisons of the resultant cost with the original estimate. This is a very important point and should be very carefully followed out.

Also, care should be exercised to see

that each contract is charged with its proper costs and only its proper cost for the use of the contractor's tools and equipment, for the use of the contractor's standard drawings, patterns and molds, etc. These charges should be based on some fair equitable plan, the basis of which is the benefits in service or commodity to the job.

There are a few expenditures of the contractor which cannot be allocated direct to a contract. An illustration of this would be time of clerks in the contractor's home office not chargeable to a particular contract, rent of the contractor's home office, and also the cost of vacations granted to employees.

It is suggested that such expenses be combined under some general heading and in the system I am describing, they are combined under a general account entitled "construction general expense" and distributed over the cost of all contracts on the basis of the labor costs, and are allocated to sub-account "general."

This seems to be the fairest way to break up these few elements of cost having no factors upon which to distribute them to the contracts.

These elements, however, should be apparently small in comparison with the total cost of the work, and in the system I mention they are less than 2½ per cent of the total cost, and the total of sub-account "general" is less than 5 per cent of the total cost.

Care should also be taken by the contractor to see that those elements of expense which occur to a greater extent in one month than in another are distributed fairly over the whole year's work through opening reserve accounts for this purpose.

A reserve is maintained for what is termed the cost of errors in workmanship and design. By this is meant errors in workmanship and design by the contractor or the contractor's sub-contractors. In the system I am describing, the reserve to carry this cost is based on one half of one per cent of the cost of production, and in establishing this system the contractor guarantees the customer against any loss or expense of this character.

Contractors necessarily must make a certain number of such errors and this plan seems to be the most satisfactory as the amount charged the customer is small and the protection is great.

The points that I have brought out in this system as being of advantage to cost plus work are equally as advantageous to flat price work, but as most of the business of our company is done on a cost plus basis, it is this class of work that has brought about the system just outlined.

There are many advantageous points in this system which I have not been able to describe in this article but which will develop where such a system is in use. But I want to say that for such a system to be a success it must be predicated on careful, accurate, and intelligent estimating on the part of the contractor, accurate allocating of costs by the contractor, and of his being ethical and honest in his charges.

Operating Reports and Their Usefulness to the Management

By E. H. Reed

Auditor Brooklyn City Railroad

EVERY public utility should adopt correct and sound accounting methods, for it must be understood that there are several parties interested in the correctness of utility accounting: First, the patrons or consumers, second the holders of both stocks and bonds, and, third, the state commissions, which have broad powers over construction, accounting, financing rates and service.

Out of commission form of regulation came the standardization of accounts, which has a very important advantage over the old method of accounting. It is essential that the accountant in charge should make a very careful study of the basic principles involved in the classification of accounts, so that a thorough knowledge may be imparted to those who are directly responsible for the distribution of the accounts.

Monthly income or operating reports give the investor reliable information as to the current affairs of the company, furnish the public and the commission with data necessary to judge fairly the company's public relations and give opportunity to the management to make comparisons of costs with similar utilities operating under like conditions, so that the relative efficiency of operation may be determined. It is usually the practice of utilities to make comparisons of the current month's income and expenses with the corresponding month of the previous year so that any increases or decreases in the accounts, for the period under review, may be shown. It should be the duty of the accounting department to make a thorough and complete analysis of these increases or decreases and a statement of the results found should be incorporated in the regular monthly report.

Another forward step could be made by a further division of accounts with very little extra expense to the utility and with no objections on the part of the state commissions. From inquiries made we find that very few companies, whether large or small, make any further subdivision than that shown in the classifications of accounts prescribed by state commissions. Under the head of "Repairs to Revenue Cars," we find that one company in New York City shows nineteen subaccounts, while another shows fourteen, with practically only two accounts that are comparable. In making a further comparison of accounts of the first company with those of a large Southern corporation, we find that the latter com-

pary has six more accounts than the one in New York with only twelve out of an average of twenty-two accounts that might be comparable. The same differences are found in comparisons of power, transportation, traffic, general expenses. In way and structures expenses we find a more comparative basis.

Under modern public utility statutes power has been given to commissions to prescribe systems of uniform accounting which furnish the facts necessary to determine the relative cost of service and the efficiency of operation. For obvious reasons the commissions go no further than the classification of accounts prescribed. With the management of a modern public utility,

however, it can readily be seen that greater detail of expenses is required for the purpose of enabling those in charge of operations to more quickly locate any abnormal increase in any one unit of cost, the result of which might be the means of preventing moneys expended unnecessarily. It is information of this character, furnished promptly by the accounting department, that gives to the management a more distinct appreciation of the operating condition of a public utility. We recommend to the members of this association that consideration be given to a more uniform system in classifying these sub-accounts, to the end that regular monthly reports may be standard.

Psychology of the Automobilst*

Tendency Toward Reckless Driving Should Be Overcome by Education and Restraint—Greater Care Should Be Exercised Also in Issuing Licenses

By L. F. Wynne

General Claim Agent Georgia Railway & Power Company, Atlanta, Ga.

LONG experience has taught us that the mental processes of the average citizen undergo a remarkable change the moment he purchases an automobile. He became a different person over night. Where he was once of a kindly disposition, considerate of the rights of his fellow men, and well content with the comfortable though comparatively leisurely mode of transportation afforded by the street cars, he suddenly becomes, when placed behind the wheel of his own motor car, a metamorphosed being obsessed with the sole idea of arriving at his destination in the shortest possible time, regardless of the rules of the road and the rights and desires of anybody else.

The lowly pedestrian, from whose ranks he has just been graduated, becomes in the motorist's eye an unspeakable being; a furtive, deceptive, dodging target whose peregrinations, if they are to be tolerated at all, should be confined strictly to the footpaths designed for them; and the street-car motorman, in this man's opinion, becomes a ruthless, scheming creature, an abysmal brute whose sole joy in life is derived from the pleasure he gets out of scattering the *disjecta membra* of motor cars over the surrounding landscape. This is the type of motorist, and he is shamefully numerous, who delights in just missing the wretched pedestrian as he scurries for safety, and who gets an unholy joy from "cutting off" a street car or another automobile in a tight place. Sometimes there is a moment's miscalculation and then the poor pedestrian, not as nimble on his feet, perhaps, as the driver anticipated—is removed piecemeal from the running gear. And quite frequently

the street car, sailing serenely on its way, cannot be stopped quickly enough to allow this lord of creation to cut in ahead, and then there follows what is technically known as an automobile accident.

This tendency towards recklessness on the part of automobile drivers is, I suppose, but a manifestation of the trend of the times; an outgrowth of our vaunted hustle and speed. It would seem that we have for so long enjoyed and revelled in the reputation of being a nation of hustlers that the very fabric of our country's prosperity is builded on a callous disregard of all the amenities of life and that the theory of the survival of the fittest is the only principle by which our actions should be governed. Of course, this constant hustling and striving has been largely responsible for our country's rise to its present pre-eminence, but there are limits beyond which this utter disregard for the rights and conveniences of others should not be pushed. When this spirit of speed reaches the point where the lives of our citizens are constantly endangered it is time to call a halt and to cast about for ways and means of abating this constant menace to our communities' safety.

It cannot be denied that one of the greatest contributing causes of automobile accidents can be traced directly to the lack of even ordinarily intelligent methods of issuing licenses to prospective motor-car drivers. Every person is not fitted to drive an automobile any more than every person is fitted to take charge of a locomotive. A locomotive's course is confined to its path of steel rails and its operation is bound about and controlled by some of the most stringent laws on our statute books. The engineer attains his position only after years of apprenticeship and after passing the most rigid of tests. And

*Abstract of a paper before the annual convention of the American Electric Railway Accountants' Association, Atlantic City, N. J., Oct. 8-11, 1923.

*Abstract of a prepared discussion on automobile accidents before the annual convention of the American Electric Railway Claims Association, Atlantic City, N. J., Oct. 8-11, 1923.

yet virtually anyone is allowed, after the most perfunctory of examinations, to take charge of a powerful automobile, a machine as potentially destructive as a locomotive, and drive it where he likes through the crowded streets of our cities. That such a person might be unfitted to assume the responsibilities attaching to his duties is rarely discovered until after the accident. The motor car may fairly be said to be a deadly weapon of which we must take account only when it is in the wrong hands. It should be our business to see that it gets into the right hands and into no others, so far as that can be accomplished by measures of education and restraint.

To insure this, a mental and physical examination should be made of every applicant for a motor-car license. Furthermore, the applicant should be required to present such a certificate of character as will afford at least an indication of his sense of responsibility to others. He should also be required to show that he is thoroughly familiar with the rules of the road and with the traffic regulations in the territory in

which his car is to be operated. Finally, he should be made to show by a road trial that he has a satisfactory understanding of the operation of the car which he proposes to drive. The possession of an annual license, however, should entitle its holder to the issue of a new annual license provided only that his record of the twelvemonth past was clear of serious breaches of the law.

We claim agents, through our intimate association with accidents and claims, and our wide knowledge of the many ramifications of the problem, should begin to take an active and leading part in the promulgation of laws designed to enforce the safe and sane operation of motor cars. Public opinion at large has so far contented itself with expressing its indignation at the time of serious accidents and saying that something should be done. That is perhaps true also of us, though our remarks might have been more than ordinarily comprehensive and vociferous. But the time when we simply "stood aghast" or "viewed with alarm" is about over, I hope, for the time to act is close upon us.

First Educational Convention Conference Indorses Plans of Committee

President Budd Promises Backing of Association in Efforts to Inform and Train Employees—Delegates Approve Plan for a Course in Economics and Ask for Definite Information as to Getting Educational Work Under Way on Electric Railway Properties

AT THE invitation of Edward Dana, chairman of the committee on education, twenty-five or more railway men, manufacturers and educators met at the Marlborough-Blenheim for luncheon on Thursday, Oct. 11, to compare notes on employee training.

Mr. Dana first called on Britton I. Budd, newly elected president of the American Association, to open the discussion. Mr. Budd said that he had grown up in the electric railway business. Among all of his interests that in men stands out strongly. He had been impressed with the difficulty of explaining to railway men the economic side of the business. The fault here lies largely with the managements which have not furnished the information which the men desire. It is an educational lack.

Again, supervisors grow old and must be replaced. Educational work must be done to provide competent successors for these employees. Technical men also need to be obtained and fitted into the organization. The work should be attractive to them.

To illustrate the possibilities of educational work on an electric railway property Mr. Budd told of the successful lectures which had been given to large numbers of men on his property and the outgrowth of the educational work in the spread of the idea to other properties. Arrange-

ments have been made by which courses on public utilities have been instituted by Northwestern University and the University of Illinois.

Mr. Dana said that there is no question as to the value of this work. How to carry it on for the benefit of the industry generally is the problem. He asked for critical suggestions of the work of the committee. M. McCants, San Francisco, said that the committee's suggestions are vague. They need to be more specific. Railway managers are too busy to apply the committee's outlines to their own specific cases. There is a chance for the association to do this. This idea was voiced by several other railway men.

ENGINEERS' PRESIDENT EXPLAINS COMPREHENSIVE PROGRAM

H. A. Johnson, Chicago, president-elect of the Engineering Association, told of the educational work done by the Chicago Elevated Railways. This started gradually with the company's system of training understudies to take the places of all men in the organization. In encouraging the employees to improve themselves the company co-operates with the trade schools informally, and assists in financing tuition. The lectures on economics, etc., which were given recently held the interest of the men in a remarkable manner, showing the keen desire for information.

The company each spring sends representatives to the technical schools to select promising technical men, who on entering its employ are given an all-round practical training. Their work is under the supervision of an executive of the company. The main problem is to find suitable jobs for these men so that they will be satisfied to remain with the railway. Under this plan only as many men should be taken on as can be conveniently accommodated in this way.

Mr. Dana asked a number of educators who were present by special invitation to give the point of view of the teacher in this matter. Prof. N. C. Miller of Pennsylvania State College explained the operation of the extension courses conducted in connection with the industries by various methods. He said that the colleges are prepared to put business information into text form and to supervise the class work or correspondence instruction, but the industry must supply the fundamental facts. He asked for co-operation in connection with the plan outlined in an appendix to the 1923 report of the committee.

J. A. Moyer of the Massachusetts State Board of Vocational Training, said that the syllabus for an industrial course must be complete if instructors are to be able to conduct it in accordance with the desire of the promoters. With a general outline like that given in the report it is largely up to the man in charge of the course to fill in the details. This requires men thoroughly in touch with the industry involved, and each will give his own interpretation of the situation. Such instruction is difficult to supervise.

Mr. Dana then read the outline of the course as given in the report and the conference agreed that some such course should be given.

C. R. Dooley, who is in charge of vocational education for the Standard Oil Company, said that work such as that proposed by the committee will bring good results, but it should not go too fast. Instruction should preferably be given to small groups and under everyday working conditions. A study of the program of the Atlantic City convention showed a remarkable amount of attention given to what are virtually educational subjects, indicating the interest which the association is taking in this line of activity. Mr. Dooley was particularly impressed with the number of companies which had appointed educational representatives, which he considered a highly encouraging indication of practical interest.

The net result of the conference was a definite determination to urge the pushing of the educational work for which the committee's efforts of the past two years have prepared the way. There is no question as to the opportunity, but the difficulty is to furnish specific help to individual companies whose requirements differ through a wide range. The proposed course in electric railway economics should be generally useful.

Proceedings of the Claims Association

Wallace Muir
Retiring President

THE American Electric Railway Claims Association held four active sessions at Atlantic City last week, the interest in the discussions being as great or greater than at any other convention of the association. This interest partly centered about the question of the proper organization of a claims department, initiated at the 1922 convention but carried over to the 1923 meeting. Great interest was also caused by other very live topics on the program.

The first session was on Monday afternoon, Oct. 8, and the first order of business was the annual address of the president. An abstract follows:

President's Address

In his annual address, President Muir explained that the program for the 1923 session had been built about three ideas, namely: (1) the operation of a claim department at a minimum cost, consistent with efficiency; (2) reduction of accidents, and (3) the automobile hazard. He commended the reports and addresses on these subjects to the attention of the delegates.

In speaking about the report of the committee on automobile accidents and its recommendation for the permanent engagement of a safety engineer by the American Electric Railway Association, he gave full credit for the idea to the committee. He said that if the report met with the approval of the delegates he hoped the next administration would be able to convince the parent association of the value of the plan.

Speaking of the value of the exchange of ideas, Mr. Muir said, in part:

"No claims agent can succeed who lives within himself. He must work, study and accept the advice and counsel of others. He must benefit not only by his knowledge of the achievements of others in the same line of work, but also by their mistakes, and this can be accomplished in only one way, and that is by a large number coming together once a year and discussing the important questions confronting them.

Code of Ethics for Railway Claim Agents Considered and Adopted. Active Discussions on Proper Organization of Claims Department and Other Topics

"Those of us who have attended these conventions from time to time know the advantages received, and we should not lose the opportunity at all times to convince other claims men, as well as executives, of the importance and benefits of these meetings. I feel sure that none of us has ever attended any of these conventions that he did not return to his work better fitted for the task and with a feeling that he had been fully repaid for the time and expense given in attending the convention."

Mr. Muir discussed the qualifications of a claims agent and outlined them in the following words:

"No one connected with the railway industry has a greater responsibility than the head of the claims department. No one has more complex and important questions to determine than he. The claims agent must be a man not only of ability and excellent reasoning power, but he must be alert to his duties and responsibilities. He must be scrupulously honest and one whose integrity cannot be questioned. He must be willing to sacrifice his personal affairs and pleasures for the benefit of his company, and above all, he must so conduct himself as to command the respect of the community in which he lives and works.

"Notwithstanding these qualifications and with all that is intrusted to him by his company, executives often times injure his work and curtail his influence in the community by their attitude toward him and his department. He must have the confidence of his superiors, and the superior must recognize his capacity and give him such a standing in his company as will show to the community the esteem in which he is held by the company. He cannot expect to succeed if he is to be but a middle man between the company and the public. He must be a part of the company."

Report of Secretary

On motion the recommendations of the president were referred to the incoming president and executive committee for consideration and action.

The reports of the executive committee and the secretary then followed. The latter gave a list of the questionnaires sent out and showed thirty-two individual members in the association. This is of course in addition to the num-

W. H. Hyland
President-Elect

ber who belong because of company affiliation. S. B. Hare, William Tichenor, and John J. Reynolds were appointed members of the nominating committee.

Code of Ethics

Russell A. Sears, general claims attorney Boston Elevated Railway presented a paper on "A Code of Ethics," published in abstract elsewhere in this issue. At the conclusion of his address, President Muir expressed the indebtedness of the association to Mr. Sears for the paper and said that if the principles as laid down by him in the paper were carried out by the claim agents there would be a much better understanding in the community. He then explained that at the request of Mr. Sears, this paper had been referred to a committee, of which W. H. Hyland of the Fonda, Johnstown & Gloversville Railroad was chairman.

Mr. Hyland urged the adoption of a code of ethics, and while he was in great accord with most of the code as suggested, he had some changes in wording to suggest. These included, in section 4, the omission of the phrase, "The representative of the company is not bound, unless requested, to disclose his identity," and in section 7, "future uncomfortable or unexplainable situations are thereby avoided."

Mr. Jack of Wilmington, in referring to section 8, asked how it was possible to know whether the injured person's representative had illegally or improperly procured authority. Mr. Sears explained that that clause mentioned was founded on a ruling of the bar association, which has always declared that if a case has been illegally or improperly solicited by the person representing it, it was not unprofessional to go behind his back and transact business with the injured person, just as though there had been no attorney. On vote further discussion on the code was carried over until the following session.

The report of the committee to investigate and report on the proper or-

TABLE GIVING ANALYSIS OF THE WORK AND COST OF SETTLING ACCIDENT CLAIMS, SUBMITTED BY COMMITTEE TO INVESTIGATE AND REPORT ON THE PROPER ORGANIZATION OF THE CLAIMS DEPARTMENT

Question	Group A (Companies with more than 5,000 accidents a year)		Group B (Companies with from 1,000 to 5,000 accidents a year)		Group C (Companies with from 500 to 1,000 accidents a year)		Group D (Companies with 500 accidents or fewer during year)	
	No. of Cos. Reporting	Amounts or Percentages	No. of Cos. Reporting	Amounts or Percentages	No. of Cos. Reporting	Amounts or Percentages	No. of Cos. Reporting	Amounts or Percentages
1 Number of accidents in 1922	15	171,620	32	69,508	14	11,744	39	6,931
2 Number of accidents of companies reporting the number of accidents investigated	10	109,107	25	51,640	13	10,933	37	6,155
2a Number of accidents investigated by companies replying to question 2	10	48,360	25	28,420	13	6,307	37	3,892
2b Percentage of accidents investigated to total	10	45%	25	55%	13	57%	37	63%
3 Number of accidents of companies reporting on number of claims made	14	165,560	29	63,338	11	9,431	38	6,532
3a Number of claims made (all descriptions)	14	50,203	29	17,405	11	2,965	38	2,059

7a Number of companies reporting decrease in same	7		13		4		1	
8 Total expenditure of claims department during year	15	\$5,998,658	30	\$2,581,016	13	\$483,870	27	\$261,673
9 Cost of maintaining claims department	15	\$1,436,723	30	\$645,315	13	\$104,096	27	\$71,874
9a Percentage of amount in question 9 to that in question 8	15	25%	30	15%	13	21%	27	27%
10 Average percentage of amount given in question 8 to gross	15	3.25	30	3.01%	13	2.5%	27	1.77%
10a Average total expenditures per company	15	\$400,000	30	\$86,000	13	\$37,220	27	\$9,700

Notes—^a Including doctors, lawyers and all persons whose salary, expense or any part thereof is charged to injuries and damages. ^b Including expense of claim organization.

ganization of the claims department with written discussions by Messrs. Drown and Robinson follows:

Claims Department Organization

The report of the committee to investigate and report on the proper organization of the claims department took the form this year of statistics which have been compiled in tabular form and are presented herewith. The committee reports that about 100 companies replied and points out that the statistics from them have been arranged in four groups, depending on the number of accidents reported per company. The following summary is also given:

Average percentage of accidents investigated to accidents reported	55
Average percentage of claims made to accidents reported	30
Average percentage of settlements to claims made	62
Average claims per company	789
Average employee per company	10
Average settlements per company	494
Average number of claims per employee	78
Average number of settlements per employee	49
Investigation shows litigation increasing in a majority of sixty-two reporting companies	62
Average percentage of claims department expense to total expenditures (approximate)	25

The report is signed by Neil W. Funk, J. S. Kubu and Walter E. Robinson, chairman.

COMMENTS BY MR. ROBINSON

Walter E. Robinson, claim agent Cincinnati Traction Company, the chairman of the committee on the proper organization of the claims department, also presented a paper on this topic. Briefly, it was a defense of the position taken by him at the 1921 convention in which he argued against "over-organization" in the claims department.

Commenting on the statistics obtained by his committee, he said it was a matter of surprise to learn that such a proportion of the reported accidents require investigation, and he felt the importance of this part of the duty of the claim agent has been exaggerated without reason and has resulted in unnecessarily over-manning many departments. In fact, he thought that an investigation in many instances is detrimental because the too enthusiastic investigator paves the way for endless trouble.

The speaker declared that the value of organization is manifested nowhere more than in the rate of percentage of expenditures to the gross revenue and that in the natural order of things the rate should decrease with increased earnings. Nevertheless, the report showed that the companies maintaining the highest earnings are likewise maintaining the highest percentage of damage expenses to the gross revenue, indicating, in the speaker's opinion, an expenditure in excess of what it should be. He thought the practice of settling claims outside the office to be the most glaring disorder of the claims department. This leads to the settlement of many claims wholly without merit or substance and can be accounted for only by the undue anxiety of the traveling adjuster. In the speaker's opinion, this method was "the surest means of incurring the displeasure of those who are seriously injured and of the greatest assistance to those who are not so sure of their injuries."

COMMENTS BY MR. DROWN

In a written discussion H. V. Drown, general claims agent Public Service

Railway, Newark, took issue with Mr. Robinson. He remembered that Mr. Robinson had declared at the 1921 convention that by the simple expedient of sitting tight in his office and compelling all claimants to come to see him he was able to keep the claim disbursements down to a fraction less than 2 per cent, and Mr. Robinson appeared to believe that any higher rate of expenditure could be explained only through over-organization in the claims department. Mr. Drown's position was that local conditions have a great deal to do with the percentage rate and that the low rate in Cincinnati is not due to the policy of having claimants come to the office of the claims agent. To prove this he quoted the figures from several companies in cities not far from Cincinnati which have as low or nearly as low a rate as Cincinnati, although the method followed by them is to go out and settle claims. As examples, the speaker mentioned Columbus, Dayton and Indianapolis. Farther to the north the percentages are higher, but it will be found also that the ratio of foreign born to the total population is higher. This ratio in Cincinnati is 10.70 per cent, whereas in Cleveland it is 30.14 per cent and in Newark, N. J., 28.36 per cent.

Another local condition affecting the percentage rate is the character of right-of-way. Thus, subways and elevated railways and railways operating over private right-of-way should have low percentage. The condition of track and equipment and the width of the street or highway has also much to do with results. Thus, Washington, D. C., with its broad avenues, should have a lower percentage than Providence, R. I.

with its narrow lane-like streets, other things being equal. The attitude of the public press also affects the figure, not only in the treatment of the company as a whole, but in its inclination or disinclination to feature accident news. In some cities the account of an accident is often accompanied by lists and addresses of the injured and writeups of court results, with the names of the plaintiffs' attorneys, thereby giving them valuable free advertising. Politics also plays a part.

Another factor is the law as regards negligence. Thus, in New Jersey the court has held: "It is not negligent *per se* or negligent in law for a person driving a vehicle in approaching a street crossing over which he intends to cross to fail to look for an approaching street car in order to avoid danger from it. The question of whether he was negligent or not must be submitted to the jury for them to determine as a question of fact." It has also been the tendency in decisions in New Jersey to hold that a pedestrian starting to cross the street and seeing a trolley car a sufficient distance away to justify him in assuming that he has the right of way need not look again toward the approaching trolley car, but can assume that the motorman will respect his right of way. In Pennsylvania the law is much more strict as against the driver of the highway vehicle as well as against the pedestrian. A somewhat corresponding difference between the laws of New Jersey and New York occurs in the extent to which the negligence of a parent can be chargeable to a child when parent and child go hand in hand into danger, if the child is too young to be chargeable with contributory negligence. The rate of compensation considered proper by the court to allow in death and personal injury cases also greatly affects the percentage. The speaker said that for some years he had been connected with the claim department in Cincinnati, and during that time he was greatly impressed with the fact that the general run of claimants was exceedingly fair to deal with. Most of them were either of German birth or descent, and the Teutons are known to be non-litigious and not ready to exaggerate or mis-state facts in the presentation of damage claims.

As a further example of the effect of local conditions, the speaker referred to Montreal, where the percentage of gross for the "injury and damage liability" was a bare 0.974 per cent of gross receipts. This the speaker attributed largely to the basic law which is modeled on the French code Napoleon. He believed that at the present time when a pedestrian is injured in collision with a vehicle in Paris he is subject to arrest for being presumptively an offender against the laws relating to traffic. In New Jersey, on the other hand, the courts have not only held that pedestrians have as much right on the highway as vehicles, but have held also that public streets in a populous city are playgrounds for children and that users of the highway must antici-

pate that the streets are subject to such uses. Such circumstances necessarily increase the damages.

Discussion

J. H. Handlon, Market Street Railway, San Francisco, said that when he first went to that city the company was paying out a large amount of money in settlement. He decided to follow the policy of Mr. Robinson and was able to dispose of 99 per cent of the claims. He believed that in some cities one plan would work better; in other cities the other plan was preferable.

In answer to a question, Mr. Robinson said that his organization in Cincinnati included four persons besides himself, and a stenographer. All are inside men. There are no outside men. He doubted whether his plan would work on a distinctly interurban property, as people cannot be asked to come a long distance. In Cincinnati, however, they can ride to his office for 8 cents. In answer to still another question, Mr. Robinson said that the largest verdict ever paid by his company while he had been connected with the claim department was \$10,000.

Joseph F. Kubu, assistant superintendent accident department, Cleveland Railway, said that in the claim department of that company there were sixty-five employees including twenty-three investigators. The company does not investigate every case, and an average of about fifty claimants call at the office every day, but he believes that there are cases where it is necessary to go outside the office to see the claimant. He thought it was a great help for a representative of the company to say to the claimant: "You may call at our office when you get better. If the company is responsible, we shall take care of you. If it is not responsible, we will not be able to do anything for you." Ambulance chasers force the company to take this course.

John W. Yensen, Third Avenue Railroad, New York, said that that company had been impressed with the remarks of Mr. Robinson at the Chicago convention, and during the last year it had been applying his policy with some of the minor claims. He thought that a year from now he would be able to tell better the practical results. He was inclined to agree with a number of other speakers that much depends on condi-

tions, and he did not believe that Mr. Robinson had to contend with a large foreign population, such as exist in many cities.

William Tichenor, claims agent Terre Haute, Indianapolis & Eastern Traction Company, said that he settled many of the claims against his company in his office, but was not able to settle all of them. He thought the proper plan was to come as near the policy of Mr. Robinson as possible.

J. S. Fairty, legal and claims department Toronto Transportation Commission, said that in a case of collision, three things were necessary. One was to be sure the person supposed to have been injured was on the car; second, to find out the extent of his injury, and, third, to show him that the company has sympathy in the case. Accidents are investigated in Toronto by a representative of the department, but only in rare cases are claims settled out of the office. He has sixteen employees in his department, including stenographers. He explained that in the Province of Quebec, the civil law rule of common fault, whereby both parties are guilty, applies, and this explains to some extent the low figures for Montreal which had been mentioned in one of the reports. The Canadian Bar Association has passed a resolution that this law should be adopted throughout Canada, though he doubted whether the law was more favorable to the defendant than the common law rule.

W. H. Renaud, Jr., claims agent New Orleans Public Service, said that the figures of that company for the past fifteen years average about 2½ per cent of its gross, and this year during the first eight months the percentage was 2.14. He has a total of fourteen employees, including office men and outside men, and believed in following up accidents. The company has had several large claims, as, last year one of \$28,000, another of \$11,000, and another of \$14,000; yet the percentage was kept down to 2.14. In Louisiana nine members of the jury can agree and bring in a verdict, even if the other three differ, but the Appellate Court has power to review both the law and the facts in a case.

It was decided not to continue the committee, and the meeting adjourned at 6.30 p.m.

Tuesday's Session A. E. R. C. A.

THE first order of business at the meeting of the Claims Association on Tuesday afternoon, Oct. 9, was action on the code of ethics as submitted by Mr. Sears, with the amendments proposed by the committee, of which Mr. Hyland was chairman, as given in the report of Monday's session. Mr. Sears said that he had no objection to the amendments offered by the committee and moved that they be adopted. Mr. Hyland then moved the adoption of the code which was unanimously accepted. The association then through a rising

vote extended to Mr. Sears a vote of thanks for his splendid work in the preparation of the code.

The paper as printed elsewhere in this issue includes the amendments.

G. T. Hellmuth, Chicago, presented the report of the committee on automobile accidents. In doing so, he referred to the meeting in Buffalo of the electric railway section of the National Safety Council, at which he was present and suggested that great benefit would follow a close connection between the electric railway section and the

Claims Association. An abstract of the report of the committee on automobile accidents follows:

Automobile Accidents

The report of the committee on automobile accidents consisted largely of the recommendation that a safety engineer be permanently engaged by the American Electric Railway Association "to vitalize and make enduring all association safety work." In its opinion this was the most important thing to do to reduce accidents arising through the operation of motor vehicles. In support of its position the committee reviewed recommendations made at previous conventions of the association, some of which had not been carried out largely because the Claims Association had no permanent staff man. In conclusion the committee says:

"Your committee feels that no business so conducted that its officers and management change each year could hope to achieve the utmost success and it believes further that we need a paid executive secretary or a paid safety engineer, call him which you please, to knit together our activities and to build up and make continuous the work of the association. This man will have to be very carefully selected by the incoming president and possibly by a committee appointed by him, and his salary should be adequate to insure getting a man with experience and ability."

The report was signed by D. M. Finch, J. G. Bruce, Carl Young and G. T. Hellmuth, chairman.

Ralph W. Emerson, general manager Cleveland Railway, presented a prepared discussion to this committee report. An abstract will be found on another page of this issue. It describes among other things the method followed by the authorities of Cleveland to curb reckless driving and the resulting reduction of automobile accidents.

L. F. Wynne, general claims agent Georgia Railway & Power Company, Atlanta, presented a written discussion on the report of the committee. An abstract appears elsewhere in this issue.

In calling for discussion from the floor, President Muir said it was generally admitted that the most important question confronting claim agents at present is the automobile hazard, and he hoped that the discussion would bring out helpful remarks. He also pointed out that the suggestion for the employment by the association of a safety engineer had been made and remarks on the plan were pertinent to this topic.

I. S. Fairty, Toronto, in referring to Mr. Emerson's paper, asked whether any other states besides Ohio had a law giving street cars the right of way over automobiles. He said he was under the impression that there was such a law in Alberta.

In reply C. B. Proctor, claims agent Memphis Street Railway, said that in Arkansas the law gave the street car the right of way both at intersections and elsewhere, and Mr. Hyland, Gloversville, said that under the New York

State law cars have paramount right of way between blocks, but at intersections the rights between the vehicle and the street car are equal.

Address by President Emmons

At this point President Muir said that C. D. Emmons, president of the American Electric Railway Association, would speak to the delegates.

Mr. Emmons said that he had simply slipped into the back of the room to see each section in action, but it was a great pleasure for him to address the delegates. He thought the success of the entire convention depended upon the affiliated associations and the way in which they had taken hold of their individual problems. No matter what kind of transportation the street railways used, the claims department would be necessary, and the faster the transportation, the more the claims department would have to do. He also complimented the claims representatives on the wonderful work which they had done in safety work and consequently in reducing accidents and accident claims.

J. W. Welsh, executive secretary, who was introduced, explained that the whole headquarters organization was at the service of the delegates and asked the delegates to send in at any time suggestions as to how the work could be improved.

Continuation of Discussion on Automobile Accidents

In answer to a question, J. S. Kubu, Cleveland, said that before new men are put to work on the cars in that city they have a lecture on accident prevention, and such lectures are given at intervals to all inspectors, motormen and conductors. The work is done through the accident prevention department of the company. J. J. Sharkey, claims agent, New York State Railways, Rochester lines, said the same practice was followed in that city.

L. S. Wynne, Atlanta, gave statistics showing that the safety work of his company had been followed by a reduction of accidents.

H. K. Bennett, safety manager United Electric Railways Company, Providence, said that 404 accidents out of 659 in a recent period in Providence were connected with automobiles and that the cost in 1922 for automobile accidents was more than 40 per cent of the entire accident cost. In Massachusetts a law has been seriously considered requiring automobiles to stop before passing over railroad crossings and to be obliged to maintain such a speed when coming out of intersecting streets on the main thoroughfares that they can be brought to a stop before coming into the highway. If such a law should prevail all over the country, it would reduce automobile accidents to a minimum. Of the 404 accidents mentioned, ninety were from right intersecting streets and eighty from the left intersecting streets; a large number were "sidewipes" where automobiles attempted to pass other traffic; seventeen were where automobiles ran head-

long into the cars; thirty were where automobiles ran into the cars which had stopped to take on passengers, etc.

S. B. Hare, claims agent Altoona & Logan Valley Electric Railway, then read the following report of a recent New York court decision:

Report of Court Decision

The burden of responsibility for motor accidents at railroad grade crossings is placed squarely upon the motorists in a decision handed down by the Appellate Division, third department, at Albany, N. Y., the text of which has just been published and is attracting widespread attention among lawyers. The decision upsets a jury verdict in which the administrators of the estate of a victim of a grade crossing accident were awarded damages. It relieves the New York Central Railroad, whose train killed the motorist James W. Horton in Albany County, of all responsibility.

The fact that the so-called disk sign existed at the approach to the grade crossing, and 300 ft. distant from the tracks, was sufficient to establish contributory negligence on the part of the motorist who was killed. The Appellate Division for the first time interprets the disk sign act, passed by the Legislature in 1919, and the court places such a construction upon the act as to make elimination of grade crossings only a matter of convenience for motor traffic, not a matter of obligation on the part of the railroads in the interest of safety of motorists.

Incidentally, the court lays down rules of conduct for motorists approaching grade crossings, and those rules form an interesting code. Among them are these:

1. The safe limit to speed in approaching a crossing is that speed at which the driver of an automobile, as he arrives at a point where he can see an oncoming train, when it is near enough to render crossing ahead of it dangerous, can stop his car if necessary before he reached the track.
2. If he can not see without stopping, he must stop. If he sees a train threatening danger to him, of course he must stop. If he cannot see whether or not he is so threatened, likewise he must stop.
3. It was the intention of the Legislature by this act that no driver of an automobile should come within the limit of the narrow strip occupied by a passing train at a time when he could collide with it.

HARD TO RECOVER DAMAGES

The effect of the decision is to make it extremely difficulty for any motorist who is struck by a train to recover damages from the railroad. The court recognizes this and says:

It is said, if so strict a rule is laid down by this statute and upheld by the courts, that seldom if ever could recovery be had for injuries received at a crossing. It is out of view that if the drivers of automobiles obey this statute in its letter and its intent, seldom if ever will injuries be suffered at a grade crossing. The price of safety by obedience to this statute means no more than three or four seconds of time—a small price for a life. And in any event we believe the Legislature was more interested in preserving life and limb than in preserving the right to recover damages for life and limb lost.

The disk sign act, Chapter 438 of the Laws of 1919, provides that the municipality or other authority charged with the duty of maintaining a highway at a grade crossing shall install and main-

tain an approach warning sign on the highway each side of the grade crossing at least 300 ft. from the track.

THE DISK SIGN

The approach warning sign shall consist of a metal disk 24 in. in diameter with a white field and a black border line 1 in. wide and with black perpendicular and horizontal cross lines $2\frac{1}{2}$ in. wide, the reverse side of each disk colored black. In each of the upper quarterings shall appear in black the letter R, 5 in. high, $3\frac{3}{4}$ in. wide, lines 1 in. stroke.

The act further provides that the railroad company shall furnish the authorities with these disk signs for erection 300 ft. from the grade crossings, and if physical conditions make it impractical to place the signs 300 ft. from crossings, other suitable locations or signs may be furnished. Then the statute says:

It shall be the duty of the driver of any vehicle using such street or highway and crossing to reduce speed to a safe limit upon passing such sign and to proceed cautiously and carefully with the vehicle under complete control.

The court remarks in discussing the statute that the advent of the motor car brought a new law and new rules, and continues:

The motor car is quite distinct from the horse-drawn wagon. It both introduces new dangers and removes some of the old dangers. It tempts high speed; it inspires impatience and encourages the driver to take chances to beat the train. Because of its weight, its momentum, its inertia, its strong metal construction and its speed, it wrecks trains. On the other hand, when properly driven and maintained in good condition, it is under complete control; it may be stopped or started at will; it will stand without hitching and may be safely left unattended; it will not take fright at a train, however close to its nose. Our old rules must be adjusted to the new condition, or new rules must be made to cover the new needs. Considerations similar to those we conceive induced the Legislature to enact the statute of 1918. The act was intended to accomplish something toward increased safety by establishing new rules of conduct.

SUFFICIENT WARNING

It has been the custom to place warning signs immediately at the crossing. One not familiar with the crossing or inattentive might not realize as he approached a crossing, its existence until he reached it. Now he is informed of it when 300 ft. away, at which point he receives timely warning; he must therefore reduce his speed to a safe limit. The safe limit is a limit at which, with his attention no longer distracted while controlling and directing his speeding car, he may discern the approaching train and stop his car before he is in the danger zone, namely, the track, which, with the overhang of the cars, means a width of only nine feet.

As to the case in hand, it is held that the motorist was familiar with the locality, and could have seen the train when he was 18 ft. from the track. If he had been proceeding carefully and cautiously, as required by law—if he had obeyed the statute he would not have been struck. The railroad gates were open, and there was no flagman at the crossing at the time, but this did not excuse the motorist. The disk signs had been erected and were sufficient warning. The estate of the victim could, therefore, recover nothing.

The decision, lawyers believe, introduces a new principle of law so far as the question of contributory negligence is concerned in grade crossings accidents. Under the old practice, the fact that the driver did not stop at a crossing was not in itself contributory negligence. It was a matter for a jury to

decide. Now it would appear that if a driver doesn't stop, after passing the disk sign, he is guilty of contributory negligence, as a matter of law.

Discussion Continued

Russell A. Sears, Boston, told of a conference of the street railways in Southern New England two or three years ago to consider what could be done to reduce the cost and number of automobile accidents. It was found that these accidents were costing the public \$2,000,000 a year, to say nothing of loss of life and limb. The interest of the Department of Automobile Licenses was secured, and the speaker expected that a bill would be introduced into the Massachusetts Legislature this fall giving the Register the right to revoke the license of any motor driver who collided with a street car at an intersecting street.

W. H. Renaud, Jr., New Orleans, believed that such a law would be very desirable if generally applied.

Cecil G. Rice, superintendent claims department, Pittsburgh Railways, said the idea of safety should be sold with every automobile. Many people are deterred from buying automobiles because of the danger of operation, and the manufacturers for business reasons should co-operate in any plan which will decrease automobile accidents. Thus the manufacturers should encourage the plan by which no one could procure an automobile license without an examination and test, and they should encourage the strict application of the traffic laws. Pittsburgh has a traffic court, similar to that at Cleveland, and it has proved of great value. Recently drivers convicted of intoxication or recklessness have been receiving jail sentences.

H. D. Briggs, assistant general claims agent Public Service Railway, Newark, thought the biggest hope for the reduction of accidents caused by automobiles was in legislation, and he urged that a committee be appointed to report at the 1924 convention on legislation of the various states on this subject, with a view to making it as complete and full as possible, as well as uniform in the various states.

William G. Fitzpatrick, general claims attorney Detroit United Railway, pointed out that legislation should give railways the right of way at all highway intersections and should include all occupants of the automobile in statutory negligence of the operator of the automobile. He thought these two things would do more to reduce the automobile hazard than anything else.

William Tichenor, Indianapolis, declared that while the legislation proposed would be helpful, the companies should not relax every effort possible through themselves. He cited the case of a car on a railroad right of way, which after whistling had struck an automobile, but of twenty-five persons who might have heard the whistle, only four did so. If the whistling had been so loud that all of the twenty-five witnesses could have heard it the occupant

of the automobile might also have done so and the collision might not have occurred. He thought that some benefit would come if automobile operation, even if in a small way, could be put under the control of the state public service commissions, for instance, in connection with the location of warning signs.

By request of a member, Mr. Hellmuth then outlined his ideas of the duties of the safety engineer proposed for employment by the American Association. Among other things such an engineer would collect claims data of interest to the association, circularize the members, and exchange their views of the legislation wanted, making it possible to advocate some specific law. His instructions would come from the executive committee, and he could suggest to the committee work he thought he could profitably perform.

Russell A. Sears, Boston, suggested that it would be more effective in public discussions on the automobile to emphasize the benefit of a clear roadway to the passengers on the car rather than demand a "right of way" for the company. He also pointed out that the registrar of automobile vehicles in Massachusetts had declared that the plan of educating motorists to greater care was all right, but it was a slow process. Immediate action is what is needed, and the one thing the driver of an automobile fears is to lose his license. This penalty has had effective results in Massachusetts.

On motion it was then decided that the incoming president of the Claims Association should bring to the attention of the executive committee of the American Association the desirability of the employment of a safety engineer.

E. L. Lindemuth, claims agent Wilkes-Barre Railway, presented the report of the committee on the Hooper-Holmes Bureau. An abstract follows:

Hooper-Holmes Bureau

The Hooper-Holmes Bureau, as is known to most of our members, operates for the insurance, railroad and street railway companies a clearing house through which information is exchanged relative to personal injury claimants. This work was inaugurated in 1899 for the accident insurance companies and a few years later was extended to the railroad companies, and, through a special subscription arrangement made with the American Electric Railway Association, to the individual member companies of the organization. Its purpose is to furnish information regarding personal injury claimants by whom prior or concurrent claims have been made against other companies. Such information in many cases is extremely valuable, the reports thus rendered affording substantial protection against fraudulent and excessive claims.

The method of handling the reports is as follows: Each subscriber or participating company is supplied by the bureau with blanks on which to report its claimants. On receipt of every such report the bureau records are carefully

examined to determine whether the party has previously been reported by any other company either for the same or a previous injury. If not, a record of the claim is simply filed away in its alphabetical place for future reference, but if the records show one or more other reports on the party, each of the companies which reported it is at once notified and can thus immediately communicate with one another and exchange information concerning such claimant.

At the present time the bureau files contain over 8,000,000 records covering the entire United States. These are now increasing at approximately 600,000 a year.

In the handling of a personal injury claim there is probably nothing more important, aside from determining the question of liability, than a knowledge of any previous claim record which the party may have. Quite often it is difficult, if not impossible, to secure this through investigation, and in some instances the information obtained is not received in time to be made practical use of in connection with the settlement. Such a service, therefore, as is rendered by the bureau constitutes a valuable adjunct to the work of the claim department, and the reports not infrequently are of such a character as to show that the claim is wholly without merit or to furnish information which is of material value in the event of litigation.

The following is a comparative statement of reports made to the Hooper-Holmes Bureau by member companies for the years ended May 15, 1923; May 15, 1922, and May 15, 1921, in which you will note there were eleven member companies reporting to the bureau in 1923, fifteen in 1922 and nineteen in 1921.

Company	Number of Reports		
	5-16-22 to 5-15-23	5-16-21 to 5-15-22	5-16-20 to 5-15-21
Cleveland Ry. Co.	1,421	1,545	2,515
Detroit United Ry.	100	82	255
Duluth Street Ry.	1	3	1
Fonda, Johnstown & Gloversville R. R.	5	93	260
Georgia Ry. & Power Co.	3,366	564	238
Hudson & Manhattan R. R.	410	345	397
Illinois Trac. System	2	2	2
Market St. Ry.	2	13	27
New York State Rws., Rochester	51	213	108
New York State Rws., Syracuse	185	200	168
New York State Rws., Utica	1	87	83
Northern Ohio Trac. & Lt. Co.	327	87	83
Pittsburgh Ry.	17	17	17
Puget Sd. Elec. Ry.	21	25	23
San Francisco-Oakland Term'l. Rws.	21	25	23
Tacoma Ry. & Power Co.	2,251	2,423	3,704
United Rws. & Elec. Co. of Baltimore	1,148	496	539
United Rws. of St. Louis	105	75	110
United Trac. Co. of Indiana	1	1	1
Wisconsin Public Service Co.	1	1	1

In addition to the companies above listed the following named association members for several years past have been actively participating in the bureau work as individual subscribers and I understand that during the three-year period mentioned reports have

been rendered by them annually approximately as follows: Boston Elevated Railway, 960; New York Railways, 340; Philadelphia Rapid Transit Company, 2,400; Public Service Railway of Newark, N. J., 2,600.

The work of this bureau for the member companies of our association has been discussed on some occasions at considerable length at various conventions of the association, at some of which a representative of the bureau was present and addressed the members on the value of the service to the member companies. One of our members has written me at length on the subject,

saying he had never been able to understand why the members of our association have not participated more generally and to a greater extent in the work of the bureau. If the street railway companies generally more freely reported their claims, the reports received by them from the bureau would save them annually many thousands of dollars.

The report was signed by E. L. Lindemuth, convention secretary.

After the motion had been carried to refer this report to the incoming executive committee of the Claims Association, the meeting adjourned at 6:30.

Wednesday's Session A. E. R. C. A.

ON WEDNESDAY the claims association held a session by itself and also a joint session with the Transportation & Traffic Association. The latter was reported as such in the issue of this paper for Oct. 13. The separate meeting of the Claims Association convened at 1:45 with President Muir in the chair. E. F. Livingstone, chief investigator of litigated claims Boston Elevated Railway, presented a paper on "The Preparation of Litigated Claims." It will be found in abstract in another column.

J. Frank O'Hare, trustee of the Boston Elevated Railway, said the time had come when street cars should have right of way on streets over automobiles because of the larger number of people carried per vehicle. The rights of passengers should be paramount to the rights of the individual, especially in the rush hours in the morning and evening. He also urged more strict sentences for violation of traffic laws by automobile drivers.

At the request of the president, a discussion of the subject of organization of the claims department, as considered on Monday, was taken up by S. B. Hare and Cecil G. Rice. Mr. Rice presented the report.

Special Committee on Organization of Claims Department

Since its inception the street railway industry has been marked by discussion of methods and practices of operation, engineering, accounting and claims. There have been exhaustive researches, broad surveys, data led comparisons and complete data compilations. In all branches selection has been made of those things found to produce the most satisfactory results when applied to the particular property making the study.

Because claims are influenced and affected by the multitudinous matters noted by the human mind, universal practices are not and cannot be adopted. Surviving through all these years is the elemental question of whether to await the presentation of a claim or to hasten conclusion of the potential liability by personal call and the extent to which inspection should be made.

During the past three years and at this convention in particular, the mat-

ter has been debated to tireless completeness. Both methods find supporters. Results reported vary. In this detail as in most matters affecting the industry action according to the circumstances is indicated, varying with the locality, the occurrence, the individuals involved and the ramifications of community life.

Comparison of results collect too many variables to warrant conclusions of cause and effect from incidental routine. Therefore this convention records adherence to the objects of the association:

To endeavor through co-operation, study and discussion to ascertain, inaugurate, maintain and develop those modes of procedure, practices, policies and ethics most effective in preventing accidents, determining and discouraging unreasonable claims, minimizing inequitable expenditures and other waste, defending against unfair demands, equitably adjusting claims owed, and otherwise advancing the ultimate best interests of member companies and those they serve.

Recognition is given to the right of any necessity for each member to determine by judgment and experience what is "most effective" according to the circumstances surrounding the interests he serves in the light of all information presented to the convention for his consideration.

A most important fundamental truth is that to prevent an accident is to eliminate a claim.

The report was signed by Cecil G. Rice and S. B. Hare, special committee.

Question Box

The questions in the question box were read by E. L. Lindemuth, Wilkes-Barre. There was time only for the discussion of one. This was "Is it worth while to try to collect damages from automobile owners who break our cars in collision, where we are free from blame?"

W. H. Renaud, Jr., New Orleans, said it was the custom in that city to collect such damages, as it had been found to help reduce automobile accidents. It brings the matter home to the owner of a car and in the case of a commercial truck, the owner often would not hear of the accident, except in this way. Many of the truck owners carry accident insurance, and the collection stimulates the insurance companies to stop accidents.

Cecil G. Rice said he followed the plan in Pittsburgh in only a few carefully selected cases.

On the Detroit United Railway, according to Mr. Fitzpatrick the work is done entirely by one individual, and the recovery pays his salary four times over during this period. The greatest good has come in a preventive way.

In San Francisco, according to Mr. Handlon, the claim is always presented where the driver has damaged a standing car or where the driver of the automobile, according to records, was intoxicated or violated a traffic rule, but where it is thought the company is partly responsible, the benefit of the doubt is given to the automobile.

New Officers

The report of the nominating committee was in the favor of the following as officers for the ensuing year:

President, W. H. Hyland, claims agent Fonda, Johnstown & Gloversville Railroad, Gloversville, N. J.

First vice-president, H. D. Briggs, assistant general claims agent Public Service Railway, Newark, N. J.

Second vice-president, J. H. Handlon, claims agent Marget Street Railway, San Francisco, Cal.

Third vice-president, C. B. Proctor, claims agent Memphis Railway and Memphis Power Company.

The executive committee consists of the officers and S. J. Herrell, claims agent Knoxville Power & Light Company; J. S. Kubu, assistant superintendent accident department Cleveland Railway; L. F. Wynne, general claims agent Georgia Railway & Power Company, Atlanta.

Convention secretary, E. L. Lindemuth, claims agent Wilkes-Barre Railway.

These officers were unanimously elected.

President-elect Hyland in a few well-chosen words said that he greatly appreciated his election and hoped that he would receive the support and help of the members during the coming year.

A past-president's badge was then presented by Mr. Bennett to Mr. Muir, who suitably replied. The other officers were then installed. The meeting adjourned at 6:30 p.m.

Engineering Association, the latter made no provision for them.

The outcome of this complaint was that at the 1919 convention, arrangements were made for the purchasing agents and storekeepers in attendance to hold several meetings, so they could determine what they wanted. It was finally decided, as a result of these meetings that the interests of this group could best be served by a standing committee to be known as the "Committee on Purchases and Stores" affiliated with the Engineering Association, which plan was adopted at the 1920 convention.

One of the first subjects assigned to it was a material classification for electric railways. There was evolved in collaboration with the stores accounting committee of the Accountants Association, the material classification as embodied in the joint committee's report on stores accounting presented at the 1921 convention. It was reconsidered and amended by this year's committee, which recommends that it be adopted. It is expected that such action will be taken at this convention.

This committee also made arrangements for and inaugurated the Purchases and Stores Question Box in *Aera*.

It is suggested that all purchasing agents and storekeepers endeavor to answer the published questions, and to furnish new questions from time to time. If this is done, we have no doubt that interest will be stimulated and maintained, and continued success will be assured for this feature.

The subject, "Proper Methods for Taking Periodical Inventories, with a View to Adopting Standard Forms," was reported on at the 1922 convention. The subject was continued and referred to this year's committee, which reviewed both reports presented by the previous committees, and recommends for adoption by member companies, the material classification and the stock book system, as suggested.

The aim of the committee is to see that purchasing agents and storekeepers are properly recognized at all times in the association's proceedings, to consider subjects of interest to the industry at large, and when recommendations are made, endeavor to have same put into effect, and carried out.

Discussion on the report was comprehensive, indicating that many had studied the advance report with an idea looking to constructive commendation. It was brought out that an increasing number of companies are arranging their stockrooms in order to adopt the classification of accounts as recommended for standard by the committee. G. H. Harris, Oakland, Calif., led the discussion with a paper explaining the methods as used on his property, particularly the application of the recommended stock book to the stores department. With this stock-book method, which, by the way, is not an accounting feature, it is possible to know exactly what is on hand in the storeroom. In further amplifying the

Large Attendance at Purchasing Agents' and Storekeepers' Meeting

Thirty-five Men Attended the First Special Meeting Under the Auspices of the Standing Committee — Interest Was Well Sustained and Attendants Voted to Recommend the Appointment of Regional Sub-Committees

THE initial meeting of the committee of purchasing agents and storekeepers at a separate session was held Wednesday afternoon, Oct. 10. L. C. Datz, president of the Engineering Association, delivered an address of welcome. An abstract follows:

MR. DATZ'S ADDRESS

It is a pleasure to welcome you here this afternoon at this your first special session of purchasing agents and storekeepers under the auspices of the American Electric Railway Engineering Association.

This has been an eventful year for the purchasing agent and storekeeper contingent of our association. This is evidenced by the interest shown by your committee throughout the year and by its splendid report to be submitted for your consideration at this convention.

Your committee has functioned well, and at the very outset I anticipated that it would, from the tone of a letter received from your chairman, accepting the appointment to head this committee.

The attendance at this meeting convinces me that the approval given you by the executive committee of the Engineering and American Associations to hold such a meeting was fully justified. You are to be congratulated on the fruit of your efforts to bring your colleagues together from all parts of the country.

In getting this approval your committee showed a marked ability as

lobbyists. When I submitted to the American executive committee for approval the request of your committee to hold a special session, this request having previously been unanimously approved by the Engineering Association executive committee, I found that individual members of your committee had thoroughly sold the idea of the special session.

And so I say that a gathering of such a representative body of purchasing agents and storekeepers is certainly worth while, and, quoting from your report, I am sure that this is an excellent opportunity to vitalize this branch of the association for the common good of the member companies and the purchasing and storekeepers individually."

I want you to feel that the purchasing agents and storekeepers have a definite place in our association and in our conventions.

A roll call was taken in order that a permanent record would be available showing the attendance. Thirty-five members were present.

In order to promote constructive discussion, B. J. Yungbluth, chairman of the committee, read the entire report.

Work Planned by Section

A few years ago a group of purchasing agents complained to the American Electric Railway Association that purchasing agents and storekeepers were not being given any recognition, and though their affiliation was with the

report, Mr. Yungbluth stated that the report contained tried methods by which it is possible to do away with the "bugaboo" yearly inventory.

Figures on the expense of installing physical changes in his company's stores department, making possible the adoption of the committee's recommendations, were given by W. C. Bell, Virginia Railway & Power Company, Richmond. In the past year \$2,500 has been spent, this being the first of a total of \$5,000 necessary to place the department on an efficient operating basis. A. E. Scott, Philadelphia, Pa., stated that a reduction of \$500,000 had been made during the past year in stores department investment, and during this same period a payroll reduction of \$25,000, or 31 per cent of the whole, had been effected.

As no corrections were suggested, the entire report was approved, with the recommendation that it be submitted to the Engineering Association for formal action.

A progress report of a sub-committee on questionnaires was given by W. N. Ford, Memphis, Tenn.

HISTORY OF THE COMMITTEE ON PURCHASES AND STORES

W. H. Staub, Baltimore, Md., outlined the history of the committee on purchases and stores. This is the outgrowth of a plan adopted at the 1920 convention. To date, the activities of the committee have been confined prin-

cipally to the materials classification and the perpetual inventory. The committee has furnished questions for the question box in *Aera*, which have brought out a great deal of valuable information. The members should co-operate by furnishing and answering questions.

H. H. Lloyd, Indianapolis, Ind., suggested that the work of the committee could be expanded through the agency of small sectional sub-committees. This suggestion met with approval and a motion was passed requesting the incoming committee to appoint regional chairmen. Each of these would form suitable committees, consisting of men who could get together easily.

P. F. McCall, Chicago, Ill., then read his paper on "Proper Control and Handling Materials and Supplies." This appears in abstract elsewhere. He was followed by J. P. Dick, Atlanta, Ga., who suggested that the questions submitted for the question box be utilized in the discussions of the committee. He read a list of suitable questions which he had prepared. He stated further that meetings like this furnish a great opportunity for purchasing agents and storekeepers, providing for them a quorum for their discussions. Previously there was no place into which they particularly fitted at the conventions. The purchasing agent is responsible for the expenditure of large sums of money and needs the opportunity for discussion such as this committee provides.

automotive industry. The committee named for this assignment is composed of L. S. Storrs, chairman; C. D. Emmons, F. R. Coates, R. P. Stevens and J. G. Barry.

President Budd was also authorized to appoint a new committee to award the Charles A. Coffin prize for the year 1924.

The executive committee approved the application of the following companies for membership in the association:

Osgood-Bradley Car Company, Worcester, Mass.; Pittsburgh Testing Laboratories, Pittsburgh; E. R. Caldwell & Son Brass Company, Inc., Syracuse; the Western Ohio Electric Company, Inc., Lima, Ohio; Gustave Schaefer Wagon Company, Cleveland; Bacon Safety Fender Company, Philadelphia; Wellman-Seaver-Morgan Company, Columbus, Ohio.

The membership of the association in the National Industrial Conference Board was continued for another year.

The president was authorized to delegate members of the executive committee to attend the annual meetings of the state and sectional association as representatives of the American Electric Railway Association.

The referendum of the United States Chamber of Commerce on reforestation was turned over to Mr. Shannahan, chairman of the policy committee, with power to act, after consultation with the wood preservation committee of the Engineering Association.

C. E. Morgan presented an application with some fifty signatures for a community section of the American Electric Railway Association in Greater New York, to be known as the Metropolitan Section of the American Electric Railway Association. The executive committee approved. Mr. Morgan reported that it is also likely that application for other sections will shortly be made.

Mr. Henry requested and was granted authority to appoint a subcommittee of the National Relations Committee consisting of members of that committee and also non-members to have charge of the association's appearance at the hearing before the Interstate Commerce Commission on Nov. 7 in Washington on the subject of depreciation.

General Harries requested the committee to appoint a representative to attend the meeting and assist in the work of organizing a national committee of national defense. Col. E. J. Blair, Chicago Elevated Railroads was appointed.

President Budd was authorized to appoint a committee to consider the location of the midyear meeting. He named the following men: J. P. Barnes, J. H. Hanna, Edward Dana, E. B. Meissner, D. W. Pontius, H. B. Flowers, G. H. Clifford, M. B. Lambert, E. P. Waller and L. E. Gould.

The next meeting of the executive committee will be held at headquarters, New York City, at 10 a.m., Friday, Nov. 16.

New American Executive Committee Holds First Meeting

THE first meeting of the new executive committee was held at the Marlborough-Blenheim Hotel, Atlantic City, on Thursday afternoon, Oct. 11, the final session of the American Association having been held that morning. Britton I. Budd, the new president, introduced the new members of the committee, who were as follows:

J. H. Hanna, Washington, D. C., and H. B. Flowers, New Orleans, representing the railways; E. F. Wickwire, Ohio Brass Company, and Cornell S. Hawley, Consolidated Car Heating Company, representing the manufacturers, and H. A. Johnson, new president of the Engineering Association. J. K. Punderford, new president of the Transportation & Traffic Association, and W. H. Hyland, new president of the Claims Association were not present. E. M. White, new president of the Accountants' Association, was represented by W. L. Davis, first vice-president.

Other members of the executive committee present were W. H. Sawyer, F. R. Coates, J. N. Shannahan, C. E. Morgan, R. P. Stevens, J. P. Barnes, J. G. Barry, C. R. Ellicott, A. A. Hale, H. D. Shute, and the following past-presidents: C. D. Emmons, A. W. Brady, R. I. Todd, C. L. Henry and Gen. George H. Harries.

Executive Secretary Welsh reported

the final registration figures at the convention to be 4404, which he said beat all previous records. President Budd appointed a committee to make nominations for a member of the executive committee to fill the vacancy made by the elevation of R. P. Stevens to the position of fourth vice-president, the term of the new member to expire Oct. 31, 1924. The committee appointed for this purpose was R. P. Stevens, J. P. Barnes and R. I. Todd.

Mr. Shannahan read the report of the committee on subjects and meetings, which was approved as it appears in another column.

A letter was then presented from H. W. Alden, president Society of Automotive Engineers, suggesting definite co-operation between that body and the railway engineering association in matters of bus design. In discussing this, reference was also made to the suggestions of Alfred Reeves, general manager National Automobile Chamber of Commerce, made in his address before the American Association at Atlantic City, urging co-operation between the railway association and this body. In view of these suggestions the executive committee decided to appoint a committee to consider broadly the question of the relationship of the American Electric Railway Association with the

Accountants' Association Proceedings

W. G. Nicholson
Retiring President

THE first order of business at the opening session of the Accountants' Association, Tuesday afternoon, Oct. 9, was the annual address of President W. G. Nicholson. An abstract follows:

Address of President Nicholson

The business of providing transportation for the public is useful and honorable. Without adequate transportation facilities our large urban centers would not exist as they are today, and the rural sections of the country would return to the isolation of former days.

It is a business which is not nourished on the misfortunes of the public but rather lends to the prosperity and well being of the communities served.

The thought uppermost in my mind during all of this year has been the devising of some way to arouse renewed interest in the work of the association and its annual gatherings. One step was taken in this direction by the appointment of an attendance committee which, following the plan adopted by the Claims Association, covered almost the entire country. It is hoped that a large attendance will result from the splendid work of this committee.

It has been suggested by Mr. Welsh, executive secretary of the American Association and secretary of this and the other affiliated associations, that some plan be arranged making it possible to have the Accountants' Association represented at the meetings of the executive committee of the American Association. The president of your association is of course a member of this executive committee. It is suggested that if it is not possible for him to attend he may delegate one of the vice-presidents to act in his place. I am heartily in sympathy with this idea. I think such an arrangement will be of great benefit to our association, and I hope the incoming officers will join Mr. Welsh in fostering the adoption of this plan.

Budgetary Control of Expenditures, Classification of Accounts for Bus Operation, and the Value of Operating Reports to Executives Were Leading Topics—Co-operation with Other Associations Urged

The work of this association has been of lasting benefit to the industry. Prior to its organization there was little or no uniformity in the accounting practice of the street railways and much constructive work was required. A survey of the papers read and discussed and the work performed by its various committees reveals the birthplace of most of the methods in use today.

The public utility accountant of today is more than a bookkeeper. His responsibilities are great. He must be well informed in all of the various branches of the business, and although public utility accounting practice has been largely standardized, he is constantly confronted with new problems. Nowhere is the opportunity offered to discuss these problems such as that afforded at these conventions.

Much constructive work remains to be done by this association. Matters of immediate interest will be reported on by your committees at the meetings this week and ample opportunity will be given each member for the expression of his views. It is hoped that all will participate actively in the discussions which arise. The thought you have in mind and hesitate to express may be the most vital and important contribution to the subject.

Report of Secretary-Treasurer Presented

Following the president's address the report of the executive committee was presented and accepted.

O. H. Bernd presented the annual report of Secretary-Treasurer J. W. Welsh, who was unable to attend the meeting. In his report Mr. Welsh called attention to the fact that this is the first year he has acted as secretary of the Accountants' Association, and spoke of the closer degree of co-ordination made possible by this new connection. He also called attention to the service available by the Association's Bureau of Information and the Question Box in Aera.

The report of the secretary-treasurer was then adopted.

The report of the committee representing the Accountants' Association at the annual convention of the National Association of Railway and Utility

E. M. White
President-Elect

Commissioners was presented by W. L. Davis. An abstract of the report as given by Mr. Davis is presented below:

Report on Utilities Commissioners' Convention

The report of the committee to represent the Accountants' Association at the National Association of Railway and Utilities Commissioners is intended to summarize the subjects brought up at the annual convention held at Detroit during the week of Nov. 13, 1922. The chairman of the committee attended this convention. A member of the subjects discussed were of interest to the Accountants' Association. Among them are:

Standard classification of accounts.
Segregation of accounts between transportation and non-transportation activities—pertaining to express and other contract carriers.
Motor transportation, with particular reference to classification of accounts and a suggested general law to cover this field.
Recent valuations of steam railroads, with particular reference to figures representing appraisals of land and right-of-way.
Methods for keeping valuation data up to date.
Division of railroad valuation data to show subdivisions by states.
Depreciation reserve (with reference to telephone companies only).

In connection with standard annual reports there has apparently been no action taken by the Commissioners' Association, but during the past few years there have been published standard classifications of accounts by that association to cover electric companies and other utility corporations. No such action covering the requirements of electric railways has yet been taken, but it has been considered.

In this connection the committee made a brief review of the principal points in the National Association classification for electric companies as compared with the 1914 classification for electric railways prescribed by the Interstate Commerce Commission. No very important points of difference were noted, with the exception of the requirements for depreciation or retirement reserves. The classification prescribed by the

National Association of Railway and Utilities Commissioners is more specific than the I.C.C. classification, and in the explanatory text the Utilities Commissioners' classification states that the reserve should in all cases be sufficient to provide during a period of years a reserve against which can be written off all losses sustained upon the retirement of property for any cause whatsoever. This classification also provides that the cost of dismantling or removing abandoned property may be charged to the retirement reserve, while the I.C.C. classification states that the expenses incident to the retirement shall be charged to profit and loss. The former classification also states that the corporations may equalize from year to year through the creation of adequate reserves the losses incident to important retirements of buildings, structures and other property units. The I.C.C. classification is not quite so specific.

There are some points of difference between the balance sheet accounts and income accounts of the two classifications, but these are of a minor nature and consist principally of the manner in which the accounts are grouped.

In view of the fact that the National Association of Railway and Utilities Commissioners had been preparing these standard classifications, it might be well for the Accountants' Association to defer any action toward the preparation of standard annual reports until the commissioners take final action concerning a standard classification.

Under the subject of valuation is the obvious necessity of detailed construction records reflecting the cost of property additions by units. It is also desirable to establish methods of securing either actual or approximate book values of material retired from service.

During the discussion of the matter of depreciation it was generally conceded that some effort should be made to ascertain whether or not public service corporations could, by excessive charges, build up depreciation reserves which would include elements representing more than the actual cost of the units included in the plant account.

The report was signed by C. S. Mitchell, B. W. Fernald and W. L. Davis, chairman.

Following the presentation of the report there was some discussion on the subject of segregation of values by states, applying to roads that engage in interstate commerce. It was voted that the report of the committee be adopted and that a final report be printed and issued within sixty days after the convention of the National Association of Railway and Utility Commissioners.

Budgetary Control

The report of the committee on Budgetary control was presented by T. B. MacRae, general auditor Chicago Elevated Railways. The report follows in abstract:

The committee is inclined to recommend restricting the term "budget" to

expenditures and the word "estimate" to revenues.

Any discussion of budget control will fall naturally into two divisions: First, estimated revenues; second, expenditure, both operating and capital.

These two again may be divided into four heads: First, period covered by budget or estimate; second, originating source; third, authority; fourth, checking budget or estimate.

Period—As, in our industry, comparisons are made month by month, and reports are made annually, the calendar year appears to be best period for which a budget should be prepared. In addition to the annual budget, the committee believes the best results can be secured by also submitting a monthly or a periodic budget. It is essential to a budget system that all estimates be made before the close of the year for the following year, or as soon as possible after the first of the year.

Authority—On a small property the auditor will take charge of the budget, confer with department heads, assemble the figures and submit the budget as finally agreed upon. On a larger system, it probably will be found more advantageous to refer all questions arising from the system to a special committee. The duties of this committee are advisory only and its findings must be approved or disapproved by the president. Such a committee will be referred to as the expense and budget committee.

Estimated Revenue—While it is theoretically impossible accurately to forecast the revenues of a railroad company, yet a reasonable estimate for an entire year can be made by months, with totals for year. A correct estimate of revenues is extremely important as the authorization of expenditures depends upon it.

In addition to the revenues, it is important that an estimate of cash requirements for the year be made, based upon the estimated revenues and expenses. The chief purpose of this estimate is to show the amounts necessary to meet taxes, rentals, fixed charges, dividends, and any financing the company contemplates.

Expenditures—Operating—The success of the budget system depends to a very great extent upon a departmental head having full information as to the cost of operating his department. Under a departmental system of accounts, this is under his control, but under the now general method of concentrating the accounting in the auditor's office, the departmental head is dependent upon the auditor, or a statistical department, for his costs.

Both operating and capital budgets should be prepared in two ways: First, the road, electrical and shop departments should map out a program for all work contemplated during the coming year and the estimated costs. This program should be prepared in as much detail as possible, showing the nature and location of the work. This estimate should also indicate whether the work is essential or can be deferred. The

traffic department also may lay out a definite advertising program and ask for an appropriation. As the transportation department transports traffic offered to it, no fixed program can be made out. The accounting department should prepare an estimate of general expenses; second, all estimates should also be prepared by operating accounts. This is essential as there is no other way of checking the budget (unless a cost accounting system is in use) and for many accounts no program can be prepared.

Extraordinary expenditures arising during the year and not authorized by the budget, should be covered by some form of special authority. It is also often desirable that the cost of a particular piece of work be kept separate and not buried in some account number.

Expenditures—Capital—The same general plan followed in the operating budget must be observed. In general, capital expenditures can be outlined to better advantage than operating expenses. Where capital expenditures are authorized on a special form, statement should be made that such expenditures were, or were not, authorized by the budget.

Authorizing the Budget—All details prepared by operating heads as above outlined, and all working papers are submitted to the expense and budget committee. This committee also has before it the estimated revenues and cash requirements. It becomes their duty to pass upon the operating and capital expenditures, as it is assumed the estimates submitted by the accounting and treasury departments cannot be changed. It is also within the authority of this committee to determine whether expenditures are necessary or may be deferred. The budget authorized by the committee must necessarily come within the limits fixed by the estimated revenues and cash. This committee then makes a full report to the proper official stating what expenses have been allowed and what disallowed and the reasons therefor. When the budget has finally been approved, the operating expenses for the year are theoretically fixed and cannot be exceeded except by special authority. The purchasing agent should be informed of expenditures authorized in order that he may make proper contracts and place orders for material required.

Extraordinary operating expenses or capital requirements should be submitted in detail to the committee, which will pass upon them in the usual way.

Checking the Budget—Near the close of the month, each department head should send to the committee an estimate of the operating and capital expenditures for the following month and submit a statement showing how far the program has been completed. The treasurer should submit a statement of cash requirements. Statements should be prepared showing the budget authorized for month and period. As soon after the close of the month as possible, the accounting department should submit, for month and period, detailed

earnings and operating expenses and capital expenditures, with any additional information the committee may require. Both the approved budget and estimated budget for month should be compared with actual expenses as shown by auditor, and discrepancies explained by department head. The committee will then report to the management the results obtained to date.

If the revenues fall below the estimates, or special financing is required, the committee and department heads are in a position to recommend reductions to be made in operating or capital. If on the other hand, earnings increase sufficiently, work that was deferred may be authorized.

Accounting Department—The following information should be furnished department heads for their information in preparing and checking budget:

First, detailed distribution of pay-rolls, by departments, if possible; second, full information as to material charged out; third, man hours by operating and capital accounts; fourth, in addition to above, co-operate with department heads to secure useful statistics and eliminate unnecessary information.

Conclusion — The committee recognizes that budgetary control is not primarily an accounting proposition. It is very largely a matter of policy to be determined by the president. The results secured in definitely controlling operating expenses far outweigh the labor and expense involved in working the system.

The report was signed by L. F. Rye, F. E. Belleville, C. A. Briggs, C. A. Dugle, T. B. MacRae, chairman.

Discussion

In presenting the report Mr. MacRae called attention to the statement regarding the monthly budget. He stated that the idea which he intended to convey in the report is that the department concerned was to submit an estimate of what it was doing during the following months. That is, the statement is merely an estimate of the monthly operating expenses. A written discussion was presented by C. R. Mahan of the Chicago, North Shore & Milwaukee Railroad.

In his written discussion Mr. Mahan called attention to the statement of the committee that it thinks the best results can be secured by also submitting a monthly or a periodic budget in addition to the annual budget. He believes that what the committee had in mind was a monthly or periodic program. In lieu of this Mr. Mahan proposed a "change of budget authority expenditure request." This request would be prepared by the department head and would indicate an appropriate detail the necessity or desirability of re-spreading the unexpended portion of the annual budget outlay.

The relationship between the program and the budget should be considered. The program need not cover every expenditure included in the budget. For instance, the traffic department might lay out a definite program for the

amount that it anticipated spending for advertising, but it would not be necessary to file a program for the routine office expenditures and expenses incidental to this work, as they could be estimated with sufficient accuracy to spread over the period covered by the budget. Upon completion of the program they would be submitted along with the budget to the committee under whose direction the master budget would be prepared. If on completion of the master budget it should appear necessary to curtail the expenditures, the committee upon making its report to the president would suggest how and in what particulars the curtailment should be made. Upon the president's decision a final master budget would be prepared and receive the approval of the president.

Mr. Mahan also believes that the budget should be fixed for the year and should be strictly adhered to in so far as each department head can consistently carry out his part of the budget, in order that the goal set may be accomplished at the end of the budget period. However, if at any time during the budget period some extraordinary occurrences might arise, over which the carrier had no control, the effect of which would seriously distort the budget to a degree that it would be impossible to carry it out as planned throughout the year, then, in his judgment, it would be necessary to prepare a new budget for the remainder of the period. A most careful study should be made to forecast the revenues from transportation, and after all the factors are assembled they should be compared in detail with the revenue for each month of the previous year in order to determine that each element has received minute attention and nothing has been overlooked. The accounting department should prepare an estimate of the general expense requirements for the year, and although the expenses are subject to a rather wide range of fluctuation, the forecast can be made with a sufficient degree of accuracy so as not to impair the value of the budget, and any fluctuations therein are readily explainable.

R. O. Crowe, Los Angeles Railway, stated that his company follows in general the recommendations of the com-

mittee, but uses the budget as a guide only, the control being a daily analysis. He mentioned a possible difficulty with the budget that certain officials may watch it too closely and so make it difficult for department heads to obtain money for necessary expenditures. M. W. Glover, West Penn Railways, stated that his company had been very well satisfied with the use of a construction or capital budget and intended installing an operating budget next year. He called attention to a possible difficulty that operating officials might use for construction purposes amounts allotted to operation in the budget, provided they could keep their operations below the estimated amount. C. H. Allen, Stone & Webster Company, stated that there is a tendency to use the budget merely as a bogey. In summing up the discussion Mr. MacRae said that the budget gives information which can be presented to the president on the first of the month, and while it is impossible to give complete figures on the operations of the preceding month at such a time, it is possible to give the operating officials information that will assist them in laying out the work for the succeeding month.

A paper on "Construction Cost Accounting from the Viewpoint of Both the Contractor and the Company" was presented by Weston J. Hibbs of the U.G.I. Contracting Company. An abstract of this address appears elsewhere in this issue.

President Nicholson announced the following committees:

Nominating committee: M. W. Glover, F. E. Webster, I. A. May, T. P. Kilfoyle and W. E. Jones.

Committee on resolutions: T. B. MacRae, E. H. Reed and W. H. Lemons.

President C. D. Emmons, of the American Association, who was present at the session, made a few remarks to the members. He called attention to the interest being shown in the meetings and the splendid exhibits. He also pointed out that new accounts will have to be included to take care of the motor bus and perhaps later the aeroplane.

L. E. Lippett pointed out that this is the first time a president of the American Association has been present at a meeting of the Accountants' Association.

Wednesday's Session Accountants' Association

The first part of the afternoon was taken up in a joint session with the Engineering Association. A report of this was given in last week's issue in connection with that association. Following the joint session the Accountants' Association continued with its own business, with President Nicholson presiding.

In the absence of Mr. Wallis, the report of the committee on standard classification of accounts was presented by M. W. Glover. He stated that the tentative classification of accounts for

motor bus operation, prepared by the committee, had been undertaken at the request of several companies which were thinking of going into this class of business, and that it was not expected that the committee would present a classification for immediate announcement. In fact, the committee requested that the association do not at this time adopt the report as a standard classification of accounts, one reason being that the committee had been working in close harmony with the representative of the Interstate Commerce Commission.

and felt that this suggestion should be presented to this representative to secure his co-operation in getting the classification adopted. The committee hoped that the association would offer suggestions and objections at the meeting, so that the committee could revise the report and then take it before the Interstate Commerce Commission. The report follows in abstract:

Standard Classification of Accounts

During the year the committee, as usual on request, co-operated with the Division of Accounts of the Interstate Commerce Commission in interpreting accounts.

Because of the growing use of buses by member companies the committee was requested to consider and present to the association a classification adaptable to the use of companies operating buses. This classification covers operating revenues and expenses and is drawn so it can be used by companies having either a bus department or a subsidiary bus company.

The committee has laid down the principle that such a classification should conform as closely as possible to that of the electric railway accounts, first, because it believes that it will be largely used by railway companies, and second, that the railway classification has stood the test of time and proved that it is well adapted to the transportation business. For profit and loss accounts, classification for balance sheet, and road and equipment accounts, the committee recommends that the electric railway classification be used.

The committee further states that in cases of companies operating a large number of buses a further diversification of accounts may be desired. The classification presented is intended to be basic and elastic and not elaborate, and if further detail is desired the classification can be elaborated as is done for class A, B and C electric railway companies and the form of the classification still maintained by using designating letters for the sub-account numbers.

The report is signed by Henry L. Wilson, William F. Ham, P. S. Young, M. W. Glover and Robert N. Wallis, chairman.

The classification of operating expense accounts for automotive transportation companies as presented and recommended by the committee for use by electric railway companies doing a bus business is divided into five primary accounts with thirty-one sub-accounts as follows:

Maintenance Plant and Equipment

- B 1—Superintendence of plant and equipment.
- B 34—Buildings, fixtures and grounds.
- B 30—Passenger motor buses.
 - a—Painting and varnishing.
 - b—Bodies.
 - c—Chassis.
 - d—Tires.
 - e—Engines.
 - f—Storage batteries.
- B 31—Freight, express and mail trucks.
- B 32—Service trucks.
- B 33—Shop equipment.

- B 37—Shop expenses.
- B 39—Miscellaneous equipment expenses.
- B 40—Depreciation of equipment.
- B 41—Equipment retired.

Power

- B 53—Power.

Transportation

- B 63—Superintendence of transportation.
- B 64—Motor bus operators.
- B 65—Freight, express and mail truck operators.
- B 66—Miscellaneous service employees.
- B 67—Miscellaneous motor bus service expenses.
 - a—Lubrication.
 - b—Other miscellaneous.
- B 68—Station employees.
- B 69—Station expenses.
- B 70—Garage employees.
- B 71—Garage expenses.
- B 77—Loss and damage.
- B 78—Other transportation expenses.

Traffic

- B 79—Superintendence and solicitation.
- B 80—Advertising.

General and Miscellaneous

- B 83—General office salaries and expenses.
- B 86—Law expenses.
- B 89—Miscellaneous general expenses.
- B 92—Injuries and damages.
- B 93—Insurance.
- B 94—Stationery and printing.
- B 98—Rent of equipment.

The operating revenue accounts are divided into two primary accounts with six sub-accounts as follows:

Revenue from Transportation

- B 101—Passenger revenue.
- B 103—Special bus revenue.
- B 109—Other transportation revenue.

Revenue from Other Operations

- B 110—Station and bus privileges.
- B 116—Rent of equipment, buildings and other property.
- B 119—Miscellaneous.

Mr. Glover explained that the standard classification presented was prepared from that of an electric railway operating buses, but that it was much condensed, as the committee did not feel it necessary to include so many sub-accounts in its classification.

In the ensuing discussion, which was entered into by I. A. May, the Connecticut Company; T. B. MacRae, Chicago Elevated Railways; Mr. Coalhard, Toronto; N. E. Stubbs, United Electric Railway Company of Baltimore; A. G. Neal, Washington Railway & Electric Company; W. E. Jones, United Electric Railway Company, Providence; J. E. Heberle, Capital Traction Company, Washington; R. O. Crowe, Los Angeles Railway; E. M. White, Binghamton Railway, a number of questions were raised about individual accounts in the classification. Mr. Glover stated that he had been in the minority in desiring to include a larger number of sub-accounts than were recommended by the committee, but that the others felt these should not be included, but should be worked out for each individual property. A conference of the representatives of the Interstate Commerce Commission is scheduled for early in November, and it is considered desirable that any suggestions that are to be made be given to the chairman promptly.

The report was received as tentative and left with the committee for further consideration.

M. W. Glover presented the report of the committee on relations with other associations. This report follows in abstract:

Relations with Other Associations

In its report the committee states that, during the year representatives have attended meetings of other associations in the gas and electric fields dealing with similar accounting problems.

As a number of member companies are interested in the operation of gas and electric properties, as well as electric railways, the committee suggests that any questions which may arise in connection with differences in accounting practices of the three classes of utilities be brought to its attention in order that the subject may be discussed with representatives of the other associations with a view of promoting uniformity in such practices.

The report was signed by L. T. Hixson, I. A. May, F. H. Sillick, F. E. Webster and M. W. Glover, chairman.

The chairman followed the report with the statement that he believes certain minor details should be worked out with representatives of the other associations in order to bring about greater uniformity. The report was adopted.

Usefulness of Operating Reports

A paper was presented by Edwin H. Reed, auditor of the Brooklyn City Railroad Company, on the subject, "Operating Reports and Their Usefulness to the Management." This paper is abstracted elsewhere in this issue.

The discussion on the paper was opened by President Nicholson, who said that it is his experience that much of the detail given the executive is useless; that is, the executive does not use it. His opinion was that in a majority of cases the preparation of such detailed reports does not justify the expense. J. J. Duck, Chicago Surface Lines, felt that when the executive asks for details they should be given regardless of the opinion of the accountant, although he felt that sometimes they are not useful in proportion to the cost. C. L. S. Tingley stated that much of the difficulty comes from the executive desiring a certain form of report for a specific study that may last for several months, after which the demand ceases. He may, however, forget to tell the accounting department to discontinue making up statements so that it will go on to eternity unless someone stops it. Mr. Reed defended his position, citing a number of cases in his own experience where a study of the detail figures had resulted in reduction of operating costs. C. E. Morgan, vice-president Brooklyn City Railroad, stated that the special reports rendered by the accounting department are to the executive what the sickroom chart is to the doctor. He is interested not in having something that indicates what the symptoms were thirty days ago, but in what the daily symptoms are, and that if he had to wait thirty days his patient would have died. He indicated that the executive has to form snap judgments, and sometimes merely glances at a report that may take an accountant several days to prepare. This should not discourage the accountant, as the vital point may

be seen in an instant. He stated that his company has information of the business up to 2 o'clock in the morning of any particular day, which acts as a guide. While these figures may not be absolutely correct, they are accurate to within a fraction of a per cent and keep the finger of the executive on the pulse of the business. The accountant's report which comes along the twentieth of the month following is used as a check on the approximate figures.

Mr. Morgan also called attention to

the value of the exhibits for accountants at the convention this year and suggested that operators stress this with the representatives of the various manufacturers of accounting devices during the year.

James Dalrymple, general manager Glasgow Corporation Tramways, stated that he places a great deal of dependence on detail costs. He does not believe that the accounting department can give the general manager too much detail.

and organization permit to charge such material to general stores account when received and to the capital account when used. This should result in material being better checked up on receipt, better cared for and recorded, and give the stores department an acquaintance with the matter that would be advantageous.

Another question that arises is with respect to the supervising of the inventory by the accounting department. In view of the fact that the chief accounting officer should satisfy himself of the substantial correctness of the inventory, and has to certify to the correctness of the company's balance sheet on which the inventory is one of the chief assets, it is desirable that the taking and the completing of the inventory should be supervised and directed by the auditor's representative.

The manner of adjusting the inventory for the stock issued during the progress of the inventory may be handled in either of two ways as proves most satisfactory locally. Any material issued from a bin after the count has been put on the card up to and including the inventory date shall be put on the card showing the date of issue. Similarly for any material received and placed in the bin. If the count for a bin has not been made before the inventory date, all material issued from and including the inventory date to the date of count must be placed on the bin card, and similarly for material received and placed in the bin.

Or all requisitions for material issued during the progress of the inventory should be rubber-stamped "Before" or "After" opposite each item issued, the stamp "Before" to be shown opposite each item issued after the counting has begun and before the particular item was counted, and the stamp "After" opposite each item that is issued after the item has been counted.

The inventory quantities will be adjusted by additions or deductions called for by the above records.

All materials received prior to the inventory date, whether on hand and in inventory, or whether issued and used, for which no invoice has been received, should be listed on separate sheets, and this should be checked against the receiving record to make sure that the list is complete. The material on hand should be included in the inventory. This list should be sent to the accounting department immediately after the last invoices have been sent in for the month's account, and the auditor should charge general stores account with the value of the list in the month's account in which the inventory is being taken, setting up on the books the same amount as a credit to accounts payable or some other appropriate account, and the invoices as they are passed for the material on these lists should be charged to accounts payable and not to general stores account. This list should be made up in detail showing date received, name of shipper, quantity, description, price and value. If a

Thursday's Session Accountants' Association

The third session of the Accountants' Association was opened by President Nicholson, who called for the report of the committee on stores accounting. This report, which was presented by Chairman R. A. Weston, follows in abstract:

Stores Accounting

The committee decided to give its attention this year to the matter of inventories of materials and supplies. It corresponded with the purchases and stores committee, and the two committees gave joint consideration to this subject.

After experience by some of the roads with the material classification recommended in the 1921 report, it was felt by the majority of the members of the purchases and stores committee that the classification as recommended, which was comprised of fifty-nine classes, could with some advantage in arrangement of material in storehouses, be somewhat amplified and enlarged into a classification of seventy-four classes. This classification is along the same lines as the one recommended and there is no change in matter of principle. It was finally voted to recommend the enlarged classification of seventy-four classes as a substitute for the classifications of fifty-nine classes. The revised classification is submitted in detail with this report.

The next matter was the use of stock books and this was substantially as recommended in the 1921 report, with the addition of detailed instructions showing how the stock book would be actually worked in the storehouses.

The third topic discussed was that of taking inventories. The recommendations of the committee on purchases and stores in regard to inventories is based upon the use of the stock book system and provides for taking the inventory in the stock book. It was agreed by the two committees that the more desirable practice is to take a complete physical inventory of the entire stock annually, on a date to be agreed upon by the general accounting officers and the head of the stores department, and it was agreed that the physical taking of the inventory should be handled by the stores department

under the supervision and jurisdiction of the accounting department. It was agreed that all of the materials in the material and supply account should be inventoried, but it is possible that there may be some misunderstanding as to the definition of what is included, or what should be included, in the material and supply account. The committee feels that it is desirable to state quite specifically in the rules for taking inventory as to the inclusiveness of the inventory, so that there may be no misunderstanding on this score.

The committee feels that the rules for the annual physical listing of the materials and physical work in counting the materials had better be left to the committee on purchases and stores as it believes that the physical taking of the inventory should be handled by the stores department. As its contribution to this subject, the committee has recommended for insertion in rules which would apply to the taking of inventories on all street railways, paragraphs which relate to the inclusiveness of the inventory, and which state plainly the accounting department's jurisdiction in the matter, and which deal with certain adjustments that have to be made in inventories due to material received and issued during progress of counting, material received or issued which has not been entered on the company's books and such matters. These recommendations are briefly set forth below.

It is felt that a complete physical inventory once a year is very desirable. Even though a perpetual inventory system is maintained by the records and check is made from time to time by physical count, yet a complete annual inventory brings to light many things with regard to the stock of unapplied material on hand that are not brought to light in other ways.

The question arises as to the best practice of handling authorization material at inventory time. By this is meant special material, or unusual quantities of material carried in stock which may have been ordered for construction or improvement and betterment work. If such material has been once charged to the construction account, should it be included in the inventory? It is much better if facilities

copy of the invoice or a shipping memo has been received the date and amount should be shown and a reference to the purchasing agent's order number.

A detailed list should be made of any invoices taken into account prior to the inventory date for which the material has not been received prior to the inventory, such as invoices for material in transit passed in order to save the discount. A detailed list will also be made of all materials shipped away or issued and used which for any reason have not been billed or charged out. These lists will be treated as additions to the inventory.

In pricing the inventory the last recorded price should be used unless it should appear that the inventory quantity is made up of more than one lot, and at different prices, in which case the average price shall be figured and used.

All labor and material on incomplete shop orders must be entered on inventory sheets separately by shop orders and checked with the material in process of manufacture.

The report was signed by C. L. Bartlett, C. J. Bent, C. H. Caskey, A. E. Hatton, J. Scott Pardoe, J. B. Walker and R. A. Weston, chairman.

CLASSIFICATION OF MATERIAL AND SUPPLIES

Way and Structures

1. Ballast.
2. Ties.
3. Rails.
4. Rail fastenings.
5. Special work.
6. Track tools, power and hand.
7. Building and paving materials.
8. Sand and gravel.
9. Track salt and sweeper rattan.
10. Lumber and timber for way and structures.
11. Castings and forgings—wrought and finished not otherwise specified for way and structures.
12. Foundry supplies.

Power Generation and Distribution

13. Fuel.
14. Boiler parts.
15. Engine and turbine parts.
16. Generator and rotary converter parts.
17. Switchboards and switchboard equipment.
18. Ash and coal handling machinery, hoists, derricks, cranes, etc.
19. Mechanical and electrical devices.
20. Storage battery parts.
21. Wire and cable for production, transmission and distribution of power.
22. Wire and cable line accessories.
23. Line poles.
24. Track bonds and accessories.
25. Signal, interlocking and telephone materials.

Equipment

26. Lumber and manufactured woodwork.
27. Car wheels.
28. Car axles.
29. Brake shoes.
30. Drawheads, automatic couplers and journal boxes complete.
31. Service car materials.
32. Iron and steel bars, sheets and shapes.
33. Pipe, conduit and tubing.
34. Metals.
35. Castings, brass and other non-ferrous metals.
36. Castings, malleable iron.
37. Castings, gray iron and steel.
38. Forgings.
39. Springs.
40. Bolts, nuts, nails, etc.
41. Pipe and conduit fittings.
42. Gears, pinions and gear cases for railway type motors.
43. Bearings.
44. Armature and field coils for railway type motors.
45. Railway type motor parts.
46. Controllers.
47. Contactors, reversers and relays.
48. Fuse boxes, resistances, electrical couplers, circuit-breakers, lightning arresters, and other power fixtures for cars.

49. Trolley and third-rail equipment.
50. Air-brake materials.
51. Door and step control devices.
52. Heaters.
53. Mechanical and electrical devices for cars.
54. Car trimmings.
55. Paints and varnishes.
56. Glass.
57. Wire and cable for cars and buildings.
58. Insulating materials.
59. Electrical supplies.
60. Machinery and repair parts.

General

61. Oil house materials, chemicals and compounds.
62. Automobile, garage and stable supplies.
63. Canvas, leather, rubber and paper supplies.
64. Brooms and brushes.
65. Hardware and tinware.
66. Tools, all kinds, except machine and track tools.
67. General supplies.
68. Stationery and printing.
69. Furniture and fixtures.
70. Material in process of manufacture.
71. Scrap—non-ferrous metals.
72. Scrap—ferrous metals.
73. Scrap—miscellaneous.
74. Containers.

Following the presentation of this report the program was interrupted so that the association could hear the address of Dwight N. Lewis, president National Association of Railway and Utility Commissioners. Mr. Lewis' paper appears elsewhere in this issue.

Returning to consideration of the report of the committee on stores accounting, a written discussion was presented by W. L. Davis, an abstract of which follows:

The value of a material classification is generally recognized. It not only furnishes the executive with valuable information in controlling purchases, but it also furnishes the storekeeper and the accounting department with an excellent medium for inter-departmental checking, particularly at the time of the annual inventory. A practical difficulty is involved in applying the classification to the stores accounts, in that the distributions, both debits and credits, are subject to clerical errors. Unless carefully watched, differences in distribution may exist to such an extent that the accuracy of the balances may be affected seriously. It is possible to take care of this by establishing a set of code numbers for the various items of material. If code numbers are not used the classification numbers may be applied at the time the material is ordered. It might also be well to suggest that a modified or abridged classification of stores accounts be prepared for the use of smaller companies or for any company which does not desire to use the very complete classification outlined by the committee.

It might be well to mention that the stock book suggested by the committee does not provide for the value of the material, and under those circumstances it is obviously necessary to establish another record for that purpose. The establishment of such a record and the methods to be used in keeping it up to date and in step with the stock book is a study in itself. Such a record appears to be necessary if physical inventories are to be compared accurately with the general books, as it is obvious that the most accurate comparisons can be ob-

tained when the physical stock and the general books are known to be represented by the same elements. The committee has covered the matter of inventory in a complete and comprehensive manner and there seem to be very few comments in order.

There is no doubt that there is an unrecorded asset often represented by the value of material charged out prior to its use, said Mr. Davis, but in stating that such material should be taken into the inventory it might perhaps be possible to overstate the inventory to some degree. If material ordered for a specific purpose and charged to the job is not used for a few months, and an inventory is taken in the meantime, the propriety of changing the distribution is open to question. The fact remains that the material was purchased as a part of a piece of work, and the money paid for it represents a part of the cost. Under these circumstances it might be preferable to omit the material from the inventory. On the other hand, should a stock of material be bought for any of several purposes and the cost thereof not be chargeable to any one account, the value of such material should be included in stores, and under such circumstances the original charge should have been made to stores.

W. E. Jones stated that the classification given by the committee was quite thoroughly in accord with the classification with which he was familiar. It was moved that the committee be continued, and that the executive committee be requested to take the matter up with the Purchasing and Stores Association in order that any duplication of work may be eliminated.

Resolutions

Chairman MacRae of the committee on resolutions read the report of his committee. Appreciation was expressed for the work of the officers and the executive committee of the American Association in preparation for and during the 1923 convention. Appreciation was also expressed to President Nicholson and the other officers for the interest taken and the work done in preparing the program and securing papers and speakers. The thanks of the association were extended to members of the committees and to those persons who prepared and read papers. The *ELECTRIC RAILWAY JOURNAL* was thanked for its interest in having representatives at the meeting and in reporting proceedings in the various issues. Special appreciation was expressed for the presence at the meetings and remarks made by Messrs. Welsh, Dalrymple, Morgan and Tingley. Thanks were extended to O. H. Berndt for his work as secretary during the convention.

Nominations

The committee on nominations, M. W. Glover chairman, submitted the following for officers of the Accountants' Association for the ensuing year:

President, E. M. White, treasurer Binghamton Railway Company.

First vice-president, Wallace I. Davis, auditor Lehigh Valley Transit Company, Allentown, Pa.

Second vice-president, J. J. Duck, general auditor Chicago Surface Lines.

Third vice-president, Walter Shroyer, secretary Union Traction Company of Indiana, Anderson, Ind.

Executive Committee: L. E. Lippitt, auditor Auburn & Syracuse Electric Railway, Auburn, N. Y.; T. B. MacRae, general auditor Chicago Elevated Railways; O. H. Bernd, secretary Des Moines City Railway; E. H. Reed, auditor Brooklyn City Railway.

These officers were duly elected.

President Nicholson turned the meeting over to President-elect E. M. White, who spoke a few words and then asked for expressions from the newly elected officers. These all indicated their desire to help Mr. White in every possible way and to further the interests of the association.

President White made the suggestion that a delegation among the accountants get together at one hotel in order to become better acquainted apart from the regular meeting. No formal action was taken on the matter.

Elmer M. White

ASSOCIATION work is not new to Elmer M. White, just elected to be president of the American Electric Railway Accountants' Association. Ever since he entered the electric railway field many years ago Mr. White has contributed of his knowledge to the industry and to the association, and once before he was an active officer of the Accountants' Association, serving as secretary from the year 1904 to the year 1908.

Mr. White is one of the real old timers, in the sense that his connection with the industry dates back to 1885. In that year he entered the service of the Hartford & Wethersfield Horse Car Railway at Hartford, Conn., and remained with that company for a period of twenty years. For a short time, namely from 1905 to 1907, he was in the South as treasurer of the Birmingham Railway, Light & Power Company, but in 1907 he returned north to accept appointment to the Coney Island & Brooklyn Railroad as auditor. This road was then not included in the system of the Brooklyn Rapid Transit Company, but it embraced some of the key lines of the city, Smith Street, De Kalb Avenue and Franklin Avenue, then highly developed and doing a gross business per annum per mile of track that ranked it very high as both a gross and a net earner. After serving with the Brooklyn road for six years Mr. White was made treasurer of the Binghamton Railway, Binghamton, N. Y., where he has since been located. Mr. White knows accounting, knows association procedure, and knows accountants, and he enters upon the work of president of the association with the hearty co-operation of the electric railway accountants, personally expressed to him.

Biographical Sketches of Newly Elected Officers

The New President of the Claims Association

STEP by step William H. Hyland, claims agent for the Fonda, Johnstown & Gloversville Railroad of Gloversville, New York, who was elected president of the Claims Association at Atlantic City, has climbed the ladder of railroad work. He broke into the railroad "game" some thirty-five years ago. This was when he secured employment as a brakeman on the Tioga branch of the Erie Railroad, a line handling a large part of the railroad traffic for northern Pennsylvania and southern New York State. He was twenty years of age at the time.

It is only a step from brakeman to conductor, but many men never make it. Mr. Hyland made the advance to freight conductor on the same branch in less than a year. The next step took a little longer. It was three years this time. Yardmaster for the Erie Railroad at Corning, N. Y., was the post to which Mr. Hyland advanced. There he remained for several years before being transferred to Buffalo, N. Y. He then left the services of the Erie Railroad and became connected with the West Shore Railroad as conductor on trains running between Newark and Frankford, N. Y. Two years later he entered the services of the Fonda, Johnstown & Gloversville Railroad.

To those who did not know Mr. Hyland well this change looked like a backward step, for he began his service with the Fonda, Johnstown & Gloversville Railroad in the capacity of passenger brakeman. But Mr. Hyland had not changed from one road to another just for the sake of change, no matter what the outward evidence might appear to be. It was opportunity for advancement that he sought, and as events have turned out it was opportunity that he found. Thus just a year after joining the Fonda, Johnstown & Gloversville Railroad he was advanced to freight conductor. Two years later he was again advanced, this time to passenger conductor, a position which he held until the Fonda, Johnstown & Gloversville Railroad started on the construction of its electric railway running between

Gloversville and Schenectady. Mr. Hyland was then appointed trainmaster and put in charge of all steam trains engaged in the construction of the new road. He remained in this position until the road was completed in 1903, when he was advanced to claims agent, a position he holds until the present day. His service with this company covers a period of twenty years.

Mr. Hyland is well known in fraternal circles, not only in Gloversville and other cities where he was employed, but throughout the entire state of New York. He was exalted ruler of the Benevolent Protective Order of Elks of Gloversville for two consecutive terms and also held the office of first vice-president of the state of New York Order of Elks in 1916. No small part of the success of the Liberty Loan and other drives throughout his section of the country during the World War was due to his untiring efforts.

Meeting of New and Old Engineering Executive Committees

Old Engineering Executive Committee Meets

A MEETING of the executive committee of the American Electric Railway Engineering Association was held at the Marlborough-Blenheim Hotel, Atlantic City, N. J., Oct. 7. The members present were: L. C. Datz, H. A. Johnson, C. H. Clark, C. R. Harte, Daniel Durie and R. C. Cram. J. W. Welsh was present during a part of the meeting, and G. C. Hecker acted as secretary.

Mr. Harte, who had been appointed to revise the rules for the adoption of standards, stated that in his judgment the matter should be held in abeyance pending definite decision regarding the association's policy on relations with the American Engineering Standards Committee. The matter was laid on the table.

Mr. Johnson, who had been appointed to study and report on the future work

of the heavy electric traction committee, reviewed the work of the committee from the beginning. He cited the opinions of various members on this subject and recommended that the committee on heavy electric traction be continued, and that it keep the association informed of the progress in electric traction as applied to steam railroads. This will include the revision and publication of the Bibliography of Heavy Electric Traction and Electrification Data. The desirability of revising this bibliography yearly may be decided later.

He also recommended that the committee be assigned subjects of vital interest to electric railroads operating subway, elevated and heavy interurban service and that the number of this class of subjects be increased after next year. The membership of the committee should include representatives of companies operating elevated, subway and heavy interurban service in addi-

tion to representatives of electrified steam railroads and manufacturers. The executive committee approved these recommendations.

Mr. Scofield, who had been appointed to study and report on a policy to be pursued in assigning subjects to the power generation committee, recommended combining the power generation and power distribution committees into one committee to be called the power supply and distribution committee. There was a prolonged discussion, which resulted in the executive committee voting to maintain two committees, as follows:

(a) Power generation and conversion.

(b) Power transmission and distribution.

It was the sense of the executive committee that the co-operative work with other associations suggested by Mr. Scofield should be carried out by the first committee, so that the association members would receive the benefit of the studies conducted by N. E. L. A. and similar organizations.

Mr. Harte, who had been appointed to study and report on the advisability of forming a signal committee, stated that he believed the subject of signals could best be handled by a sub-committee of the power distribution committee. Mr. Cram stated that he was in favor of forming a standing committee on signals. The executive committee voted to assign the subject to the proposed committee on power transmission and distribution.

The secretary announced that H. H. Norris has accepted appointment as the association's representative on the sectional committee on preferred numbers of the American Engineering Standards Committee, and that R. C. Cram has accepted appointment as the association's representative on the sectional committee on the industrial sanitation code.

The invitation of Charles E. Heywood, standards department, Society of Automotive Engineers, to appoint a representative on the sectional committee on numbering of steel was accepted.

The invitation of Dr. G. K. Burgess, Director, United States Bureau of Standards, to appoint a representative on the sectional committee being organized to revise Parts 1 and 3 and Section 9 of the National Electrical Safety Code was also accepted.

The committee passed a resolution thanking President Datz for the photographs of past-presidents of the association, which he had framed and placed in the headquarters office.

The secretary announced that the recent letter ballot indicated the executive committee was in favor of the appointment of a representative on the joint committee of National Engineering Associations, to review the A.I.E.E. standards for synchronous converters.

A letter from H. H. George was read, recommending that the special committee on wood preservation be constituted a standing committee. It was voted that this be made a standing committee.

Meeting of New Engineering Executive Committee

THE first meeting of the 1923-24 executive committee of the Engineering Association was held at Atlantic City, Oct. 11. Members of the executive committee present were H. A. Johnson, C. H. Clark, R. C. Cram, C. R. Harte, Daniel Durie, R. H. Dalgleish, M. B. Rosevear and J. W. Welsh. Past-presidents F. R. Phillips, J. H. Hanna, H. H. Adams and L. C. Datz also attended. G. C. Hecker acted as secretary.

The report of the committee on subjects was approved with several amendments. The amended report as approved is published below.

Mr. Adams suggested the appointment of a committee of five to co-operate with the National Fire Protection Association in revising that part of the National Electrical Code dealing with rules for car wiring. Mr. Adams pointed out the opportunities for obtaining a reduction in insurance rates through proper wiring of cars to comply with the code and also pointed out the necessity for reasonable code requirements. The executive committee voted to appoint such a committee with the understanding that it did not conflict with the revision by the American Engineering Standards Committee.

The executive committee voted to appoint a special committee on individual membership in the Engineering Association. This committee is to be instructed to co-operate with the committee of the American Association on company section and individual membership. L. C. Datz was appointed chairman of this committee.

The executive committee voted in favor of the appointment of an alternate to the representative on the main committee of the American Engineering Standards Committee.

The executive committee voted in favor of the organization of a special committee on engineering symbols, to consist of a representative of each of the standing committees involved in the use of symbols. The committee is to be instructed to prepare its report in a suitable manner for inclusion in the Engineering Manual.

It was voted to request the American Society for Testing Materials to join with the association in submitting for approval as American standard, the specification for the manufacture of open-hearth steel girder rails of plain, grooved and guard type, Manual Section Wr 2d. This specification is understood to be in complete conformity with A.S.T.M. specification A2-21 as recently revised.

The suggestion of the committee on heavy electric traction that the bibliography be revised and simplified as suggested by Prof. R. B. Warner of Yale University and brought down to date was discussed. It was voted that the secretary take up the matter with Professor Warner and obtain an estimate of the cost of doing the work.

It was decided to continue the special

committee on automatic substations for another year.

The request of the committee on power transmission and distribution that it be permitted to erect a trolley wire over the proposed rotary service testing machine of the welded rail joint committee for the purpose of making comparative trolley wire wear tests was discussed. It was voted to defer action on this matter until the next meeting, at which time it was hoped that the status of the proposed testing machine would be more definitely established.

The suggestion of the committee on power transmission and distribution that the association employ a research engineer or found a research fellowship at some university to study trolley wire performance and specifications, was discussed. Mr. Dalgleish stated that he thought the United States Bureau of Standards might be able to assist in this research work. It was voted to defer action on this matter until the next meeting and Mr. Dalgleish was requested to take up this matter informally with Dr. Burgess, director of the Bureau of Standards.

It was voted to approve the recommendation of the committee on power transmission and distribution to request the A. E. S. C. to organize a sectional committee on specifications for high strength, low conductivity, trolley wire. It was also voted that the Engineering Association request the A.S.T.M. to join in making this request and also in undertaking jointly the sponsorship for such a sectional committee.

President Johnson appointed the following sponsors for standing and special committees for the year.

Power Transmission and Distribution: M. B. Rosevear.

Special Committee on Automatic Substations: E. H. Scofield.

Buildings and Structures: C. H. Clark.

Power Generation and Conversion: E. H. Scofield.

Purchases and Stores: R. H. Dalgleish.

Heavy Electric Traction: C. R. Harte.

Way Matters: R. C. Cram.

Engineering-Accounting: C. R. Harte.

Equipment: Daniel Durie.

Wood Preservation: M. B. Rosevear.

Special Committee on Engineering Symbols: R. C. Cram.

Subjects for Engineering Association

THE committee on subjects of the American Electric Railway Engineering Association submitted a list of assignments for this year's committees to the executive committee, which formally approved it at the meeting held Oct. 11 at Atlantic City. The list as prepared by the committee follows:

EQUIPMENT

1. Continue the study of helical gears, including long and short addendum teeth, web hole standardization and the whole subject of car gearing.

2. Continue the study of various devices for trolley contact and the effect

upon trolley wire. This subject is to be studied in co-operation with the committee on power transmission and distribution.

3. Review of Manual sections on equipment under the heading "Miscellaneous Methods and Practices." These are to be revised with the idea of including in the Manual any which may have sufficient value to warrant it.

4. Continue the study of spring supports for railway motors with a view to the elimination of undesirable types, and the standardization of the more desirable ones, in so far as possible.

5. Study existing practices in the matter of inspection periods for car axles with a view to developing a practicable set of rules, for inclusion in the Manual under "Miscellaneous Methods and Practices."

6. Study air brake tests conducted under the auspices of the Central Electric Railway Association and present a digest of the salient features.

7. Review of existing standards, with particular reference to the following Manual sections:

(a) Section Et 18a and Em 3a to bring them into conformity with the new wheel contours adopted at the 1923 convention.

(b) Revise the tables in Section Et 7b to bring them into conformity with the new wheel contours adopted at the 1923 convention, and expand the tables to permit obtaining standard flanges and treads in all of the standard diameters shown in present Table 1.

(c) Revise Sections Et 9b, Et 14b and Et 15b in accordance with the recommendations of the 1923 committee on standards.

WOOD PRESERVATION

1. *Specifications for Open Tank Treatment of Wood Poles*—The subject of open tank pole treating plants for small operating companies should be studied and reported on.

2. *Specifications for Brush Treatment of Wood Poles*—The committee is instructed to continue the study of this subject and report on the desirability of preparing a specification for a suitable grade of creosote oil for brush work.

3. *Specifications for Pressure Treatment of Wood Poles*—The 1923 committee submitted five specifications for information only. This committee is instructed to make a further study of these specifications with a view to their inclusion in the Manual.

4. *Perforation Process for Timber Treatment*—The 1923 committee felt that this method of treatment of timber had not become sufficiently standardized to justify making definite recommendations. The committee is instructed to make a further study of this subject.

ENGINEERING-ACCOUNTING

Continue the study of classification codes of items of work in construction and reconstruction so arranged that the I. C. C. account numbers may be readily adhered to. The purpose is to elaborate on the I. C. C. accounts so

that at any time during the progress of or after the completion of a job the cost of any item may be determined.

HEAVY ELECTRIC TRACTION

1. Revise and bring up to date the bibliography of heavy electric traction and electrification data: rearrange the bibliography as outlined in the report of the 1923 committee for publication in pamphlet form.

2. Collect and tabulate data on: (a) Branch line electrification; (b) self-propelled cars, such as gasoline, gasoline-electric and Diesel-electric, as well as storage battery cars; and storage battery locomotives for yard work.

3. Study train operation with particular reference to articulated trains. Review and present information on existing articulated trains.

4. Make a study of connections between cars used in train operation, reviewing those in use to date and suggesting improvements in all types, including electric, mechanical and air couplers.

5. Review of existing standards.

BUILDINGS AND STRUCTURES

1. Continue the study of Electric Railway Terminals for both City and Interurban service—(a) Passenger terminals; (b) freight terminals for city and interurban service; (c) combination terminal.

2. Study designs of buildings for proper storage and maintenance of buses.

3. Review of existing standards.

POWER GENERATION AND CONVERSION

1. Continue the study of a uniform scheme of recording failures of power apparatus and interruptions to service originating within the generating station and the substation.

2. Continue the study of existing practices in the design and operation of automatic substations. This study should include the subject of remote supervisory control.

3. Study ventilation systems for automatic substation.

4. Review of existing standards.

PURCHASES AND STORES

1. Study and present information on a method of classification and sale of scrap materials to increase the revenue therefrom.

2. Study and report on the proper place for the purchasing and stores departments in a company's organization.

3. Review of existing standards.

POWER TRANSMISSION AND DISTRIBUTION

1. Review the subject of concrete pole design and maintenance.

2. Study dimensions of approach ears of flexible tips with a view to standardization of the ruling dimensions.

3. Study dimensions of various types of suspensions, with a view to standardization, particularly of the ruling dimensions.

4. Review the work of the 1923 committee on catenary overhead construc-

tion, other than for steam railroad electrification.

5. Prepare specifications for catenary suspension materials.

6. Trolley wire wear and composition—(a) Continue the study of the composition and the wear of trolley wire; (b) continue the study of trolley wire breaks from causes other than wear; (c) continue the study of various devices for trolley contact and the effect upon trolley wire. This subject is to be studied in co-operation with the committee on equipment.

7. Continue the study of temporary connections to trolley wire.

8. Continue the study of overhead construction for trackless trolleys.

9. Review existing standards. Special attention is to be given the existing standards on block signals. The committee on power distribution should bring these specifications into conformity with the best known signal practice.

WAY MATTERS

1. Continue the subject of standardization of frogs.

2. Continue the study of design of substitute ties in co-operation with American Railway Engineering Association.

3. Continue investigation of all forms of welded joints in co-operation with the committee on welded rail joints.

4. Study and submit design and specification covering solid manganese steel, electric over steam railroad crossings. This subject should be studied in co-operation with the track committee of the A.R.E.A.

5. Study the standardization of switches and mates.

6. Study and report on the need for and the desirability of adopting a narrow groove guard rail as standard.

7. Prepare design of standard hook head railroad spike.

8. Study surface hardening of rails in the mill and on the street.

9. Submit additional specifications covering design and manufacture of tie rods.

10. Review of existing standards. Special attention should be given to the following: (a) Ws 2a, "Rules for Determining the Gage of Track on Curves." This revision is necessary because of the adoption of new wheel flange contours as standard. (b) Wr 7a, specification for carbon steel rails of standard section. The committee should take up with the A.S.T.M. the matter of revising Section IV—Subsection 402—Page 6—so as to provide for the furnishing of standard section rails in 60-ft. lengths.

UNIFICATION OF CAR DESIGN

Continue the subject of unification of car design.

UNIT METHOD OF VOTING ON STANDARDS

The work of this committee is to be continued.

AIR RESERVOIR SPECIFICATIONS

The work of this committee is to be continued.

Association News & Discussions

Concluding Sessions of Safety Council

The Automobile Hazard and Community Co-operation in Safety Movements Principal Topics Discussed—J. P. Barnes of Louisville
Elected Chairman of Section for Ensuing Year

THE electric railway section of the National Safety Council concluded a very successful three-day meeting in Buffalo on Oct. 4, when James P. Barnes, president Louisville Railway, was elected chairman of the section for the ensuing year. The report of the meeting on Oct. 2 was published in the *ELECTRIC RAILWAY JOURNAL* of Oct. 6, together with a copy of a paper read at the Oct. 4 meeting by D. E. Parsons, general manager East St. Louis & Suburban Railway. Lack of space in the issue of Oct. 13, because of the need for reporting the Atlantic City convention, precluded the publication of a report of the concluding sessions of the electric railway section of the National Safety Council.

THE AUTOMOBILE HAZARD

The session on Wednesday, Oct. 3, was a joint meeting of the electric railway and public utility sections and was devoted to the subjects of the automobile hazard and valuable sources of information on accident prevention not generally utilized. More than 250 attended this session of the congress, which was held in the Fillmore room of the Hotel Statler, which is furnished with furniture taken from the former home of the late President Millard Fillmore. A. O. Mitchell, adjuter of the Northern Indiana Gas & Electric Company, Hammond, Ind., was chairman of the public utilities section and he acted as co-chairman with Mr. Truett.

James P. Barnes, president Louisville (Ky.) Railway, was the first speaker, his subject being "The Automobile Hazard."

Mr. Barnes began by referring to some recent statistics on automobile accidents, published in the *Literary Digest*. According to that paper a person is killed in the United States every fifty minutes by automobiles, and the prediction was made that before 1923 was ended one person out of every ninety in the United States would have been so killed or injured. Statistically, Mr. Barnes said, that statement is almost incomprehensible, yet the casualties are increasing so rapidly there must be some deep underlying cause for it. On the other hand, the record of accomplishment by law in some places has been good. Thus the speaker noticed recently in Cleveland that traffic seemed to observe the speed limits carefully and people used great

caution in crossing the streets. Inquiry disclosed that Cleveland had established the plan of impounding the cars of speed ordinance violators and the careless driver had to pay storage for his car through the length of time he was forbidden to drive. The contrast with this condition and that in Buffalo was most marked.

Safety campaigns, the speaker said, have some effect, and it is noteworthy to see the effect they have upon children. Children think more simply and directly than grownups, and once they have accepted the conclusion, once they have come to believe a certain thing is dangerous because they have seen it in practice or been told by their parents or teachers they are more apt to be guided by that than the adult who has learned "to take a chance." The only real remedy is a restoration of "common horse sense" and a spirit of human kindness behind the steering wheel. Each person has a responsibility to society and other individuals, and this cannot be put off by the question: "Am I my brother's keeper?" So we must continue our safety campaigns and try to impress individuals with the fact that their duty to society is not only self protection but protection to others. We must also constitute ourselves centers of energy in the distribution of propaganda that the laws must be observed, and this world must become a place where each man will feel in himself some definite measure of responsibility for his fellow-men.

R. R. Hadsell, superintendent of transportation New York State Railways, Rochester Lines, and president Rochester Safety Council, in discussing Mr. Barnes' address, pointed out that the cause of most automobile accidents was recklessness or thoughtlessness of the driver rather than imperfections in the machine. Of course, a steering knuckle may break at times or a tire come off when it is particularly dangerous to have such a thing happen, but accidents are more often attributable, in the speaker's opinion, to a desire to beat the other fellow to a crossing or into a lane of traffic or else to indifference to the rights of others. Thus, railroad crossing accidents are alarmingly frequent, even where warning signs are conspicuously placed and there is an unobstructed view of the crossing for a considerable distance. The speaker had been impressed in

reading accounts of such accidents, with the fact that in the majority of cases the persons involved had foreign names. This had led him to believe that many of them do not know the traffic laws, do not carry insurance on their cars, and often are not financially responsible for the damage they do through their negligence. One method of reducing this danger is strictness in the issuance of licenses and in the assessment of penalties for reckless driving.

Mr. Barnes' address was also discussed by H. L. Mitchell, vice-president West Penn Railways of Pittsburgh.

The principal speaker on the second topic of the day was W. F. Canada, director of engineering National Electric Light Association. He urged the need of engineering methods and organization in safety work. One step along this line has been a drafting of codes for protection against the fire hazard and other codes are in the making. Another step is in the compilation and study of statistics of injuries to show the kinds of work and the kinds of location where injuries occur with greatest frequency and severity and the percentages of persons that are injured. By these statistics it is possible to arrange for different safety practice methods where they are most needed.

The meeting on Wednesday morning was followed by a luncheon, presided over by Charles B. Scott, general manager Bureau of Safety, Chicago. The speakers discussed electric safety problems and included R. M. Searle, president of the Rochester Gas & Electric Corporation, Rochester, N. Y., and R. Russell Bowen, vice-president of the Washington Railway & Electric Company, Washington, D. C.

FINAL SESSION AND ELECTION OF OFFICERS

At the closing session of the electric railway section, National Safety Council, on Thursday, Oct. 4, James P. Barnes, president of the Louisville (Ky.) Railway, was elected chairman for the ensuing year. Mr. Barnes succeeds J. H. Truett, chairman of the safety committee of the United Railways & Electric Company of Baltimore, Md. H. M. Keyser was elected vice-chairman. He is secretary and claims attorney for the Washington Railway & Electric Company, Washington, D. C. He succeeds G. T. Hellmuth, claims attorney for the Chicago, North Shore & Milwaukee Railway, Chicago. M. W. Bridges, safety engineer for the Chicago Elevated Railways, Chicago, was re-elected secretary of the section. The election of the three was unanimous.

The Thursday session of the electric railway section of the congress opened with a round-table discussion on the topic "Co-operation of Electric Railways in Community Safety Activities." C. B. Scott of Chicago said that the electric interurban lines operating through a large number of small communities face a difficult problem because it is impossible to organize local safety councils in these towns and villages. He said, however, that it is not difficult to interest local citizens in safety work and that this volunteer service, while not expensive is often very effective.

Louis C. McBrayne, manager of the Massachusetts Safety Council, Boston, explained the activities of the safety work in his state through co-operation between electric railway lines and newspapers. He said that the big menace to electric railways is the motorist who shoots out at a side street and the auto driver who cuts in front of a car. He said that railways should encourage motormen to report careless auto drivers and said that in Massachusetts friendly letters are written to motorists thus reported by motormen, urging them to be more careful. He also urged electric lines to encourage their trainmen to become speakers on safety problems before local gatherings and added that if a general manager or railway executive spoke, the public would say, "he wants to save money for his road," but if a trainman did the speaking, it would be much more effective.

Mr. Barnes, president of the Louisville company, told the electric traction officials that not sufficient credit is given to platform men in the safety movement and that too much credit is taken by the executives who serve upon the safety committees. He told of a parade in Louisville where taxis were driven through the streets by twenty-four drivers who had not had an accident in from one to three years. The passengers in the cabs were trainmen in the employ of the Louisville company who also enjoyed non-accident records. He said the demonstration resulted in much good publicity and aided in the safety movement in that city.

After D. E. Parsons, general manager of the East St. Louis & Suburban Railway, St. Louis, presented his paper on "Safety Principles as Applied to the Individual Utility" (see *ELECTRIC RAILWAY JOURNAL*, Oct. 6, page 568). There was a discussion, lead by A. J. VanBrunt, director of safety education for the Public Service Corporation, Newark, N. J. He said that too many electric railway executives pay little or no attention to safety work and he charged these officials with mismanagement and shortsightedness. He declared that safety work should not be spasmodic but should be carried on with systematic regularity. He said the saving due to safety work is greater than the outlay of money used to carry on such work and added that, "to cure is a voice of the past and to save is the voice of the future."

A. W. Koehler, director of safety

New York State Railways, Rochester Lines, indorsed the position taken by Mr. Parsons and referred particularly to the need by the safety departments of sufficient funds and authority to carry on their work. Spasmodic effort or ill-advised propaganda, he said, is worse than useless, and while on large properties it is essential that accident prevention methods be supervised by some responsible person, every department and every individual must take an active part. The safety organization and meetings, however, do something more than result in accident reduction. By bringing employees and employers together in informal meetings, the old-time close relation between the two, which has been all but lost in these days of large companies and corporations, is brought back, and there is fostered a spirit of friendliness and help-

fulness that is a tremendous asset to any public utility company. Organized safety also fosters a feeling of confidence in the management on the part of the public, as well as better public relations in the community in which the company operates.

The conference adjourned after a motion was made authorizing Mr. Barnes, the new chairman, to carry the message of safety to the claims officials at the Atlantic City convention and invite them to become members of the Electric Railway section of the National Safety Council. Mr. Truett, the retiring president, on behalf of himself and the other officers, thanked the section for the spirit of co-operation manifest during the year and commented upon the growth and importance of the Electric Railway section of the congress.

Unit Container and Demountable Body*

Conditions Are Outlined Favorable for Their Use—English Practice with Duralumin Containers Described—Advantages and Disadvantages of the Various Types of Containers Are Outlined

BY F. C. HORNER

Consulting Engineer General Motors Corporation, New York

UNIT containers, which can be loaded and sealed by the shipper, transported to the consignee on truck chassis, freight car, boat or all three without disturbing the contents, offer great possibilities in the co-ordination of all transportation facilities. The outstanding instances of unit container use in this country are to be found at Cincinnati, Ohio, and on the New York Central Railroad lines.

The demountable body in various forms is in use to a limited degree in many parts of the country and is probably more adaptable for general purposes of motor truck cartage than the unit container. In other words, the unit container is commonly referred to in connection with traffic interchange between rail and road vehicles, whereas the demountable body is more often used simply for interchange between motor truck and loading platform. In one sense a unit container is a demountable body when used with a motor truck, and a demountable body can easily be used on an ordinary flat car on rail movement. The container car, however, is one fitted to accommodate a definite size of container and is not used with any other equipment.

The best and latest type of unit container with which I am acquainted is constructed of duralumin. Its unladen weight is only two-fifths that of an oak container of equal capacity; that is, assuming the weight of an oak van as 1 ton, the duralumin van would weigh 800 lb. only. It is made in England, and besides the advantage gained in the reduction of weight, the manufacturers claim a great reduction in the

cost of maintenance, though of course, that has yet to be proved. If actually subjected to load tests, duralumin vans would carry three times the loads of the wooden ones, but the main idea has been to combine lightness, strength and durability, the last two relating to the power of the container to resist impact blows against railway trucks, ship hatchways and docksides. Vickers duralumin has a tensile strength and hardness equal to good quality mild steel.

In discussing these duralumin containers with Mr. Griffiths, the manager of motor vehicles for Lyons & Company, London, the first firm to use them, I was told that after one year of service the maintenance and repair cost was practically nothing, whereas the cost of repairs to the wooden containers was very high.

The New York Central type of container was designed primarily as a unit that would fit a special flat car, but of a weight and size easily adaptable to the conventional motor truck chassis equipped either with or without a body. I believe the latest type has a capacity of 7,000 lb., the unladen weight being about 3,000 lb.

The container used by the Cincinnati Motor Terminals Company has a capacity of 4½ tons, and is of wood construction, with doors on both sides and both ends, and its unladen weight averages about 4,000 lb. For a time the Terminals Company and one of the electric railway companies entering Cincinnati conducted an interchange container service for the movement of l.c.l. freight. But the Cincinnati plan is essentially a motor truck movement for the transfer of trap-car freight between various rail terminals in what are quite commonly called demountable bodies.

*Abstract of paper delivered before a gathering of electric railway executives at the office of E. J. Burdick, general manager Detroit United Railway, at Detroit, Mich., Sept. 13, 1923.

Other types of unit containers are:

1. Glass-lined tanks, such as are used on the New York Central lines and adaptable for milk and other liquids that can be shipped in bulk.

2. Containers for household goods, tobacco products, confectionery, and other commodities carrying a high tariff are in use in various parts of this country and Europe in a very limited way.

Referring to the demountable body, we have wider variety of types to choose from than with unit containers. The simplest and most adaptable type that I know of is an English invention. The London & Southwestern Railway, through the use of these bodies, increased the tonnage moved per day per motor truck almost 40 per cent within six months. Demountable bodies and flats are also used in England by Carter Patterson, the big express carriers, by the furniture and household goods movers, and in the cotton industry around Manchester. In the latter case the flats are often interchanged between rail and road vehicles. For protection from the weather, a sheet or tarpaulin tied over the bolts of cloth is all that is necessary.

In this country we have not developed this class of equipment to as great an extent as has been done in England. However, more and more thought is being given to the question of reducing delays in loading and unloading. The American Manufacturing Company and the L. K. Liggett Company are among the most prominent companies that have been using demountable bodies for some time and effecting real economies.

ADVANTAGES OF EACH TYPE

The principal advantage of the unit container adaptable to the rail and road vehicles in the transportation of goods is the saving in labor costs by reduction in handling operations. According to a paper presented before the Society of Terminal Engineers by F. S. Gallagher, engineer of rolling stock, New York Central lines, the individual package in less-than-carload freight customarily is handled at least thirteen times in passing from the shipper to the consignee, whereas, with the unit container, much of this handling is done in bulk.

Other advantages of the unit container are the saving from loss and damage to goods, and the saving that can be made on many classes of goods in crating and packing. This in turn permits of very material reduction in floor space required, which makes expansion of the business possible without further outlay in rental or property.

The advantages of the demountable body or flat over conventional fixed-on types are principally savings in time, and savings in floor and street space.

For instance, the motor truck chassis standing time can be reduced to a minimum by the scientific use of demountable equipment. The best demonstration of this can be seen at Cincinnati, where 225 bodies are used with only fifteen motor truck chassis. The voluntary standing time of these trucks

for fifteen trips in eight hours is only about 15 per cent of the total, an excellent showing.

A very good example of the possible saving in floor space can also be found at Cincinnati. But the demountable flat equipment holds out the greatest possibilities from the standpoint of floor space economy, because it can be arranged so that the flat—or tray, as it is often called—forms a part of the platform itself. This can be accomplished by sliding the flat direct from the motor truck chassis into a pocket in the loading platform. To go further still, the flat can be rolled to any position on the floor, and if proper capacity elevators are available, to any position on any one of all floors in a building. This, of course, can also be done with unit containers, but both classes of equipment must be designed to fit prevailing conditions.

In short, where the goods can be moved in open bodies, the flat is by far the most adaptable and economical equipment that can be used for road transport work. Reduction in weight is also a big factor to consider when these hauling problems are analyzed. The flat, or tray, with a sheet or tarpaulin covering affords ample protection to goods hauled comparatively short distances; moreover, it is possible to collect and deliver those goods at store doors in a much more efficient manner than can be done with a closed-in container or box body.

Another type of equipment which may be called detachable rather than demountable is the tractor semi-trailer, or six wheeler. This equipment, which can be used to great advantage for many motor truck haulage operations, has come into quite common use in this country within the past few years. English road transport operators are also taking up this invention with great interest, and good results—only, however, within the past two years. But as the semi-trailer is not made for transfer between railway car and road tractor, I will not go into the subject further here.

Referring to bodies and flats, I think the motor truck owners have failed to realize all of the possibilities of this kind of equipment, largely because they usually conclude that overhead cranes or tackle of some kind is necessary at loading platforms, in order to make the operation really effective. They have evidently lost sight of the fact that with properly designed equipment wherever platform and chassis are about at the same level no overhead cranes or special equipment are required. Furthermore, the bed or flat can remain on the chassis for any length of time desired but is adaptable for removal where conditions permit. And now that we have found a way to transfer a flat or body from the ground to either truck chassis or flat car on rails, with the power derived from the motor truck engine, another disadvantage has been overcome.

But going back to the unit container used for interchange between electric

and steam railways, and road vehicles, we have another story. I have discussed this subject at some length with both railway and road-transport men abroad as well as in America and my conclusions are that, without radical departure from present-day practice, it is only for special classes of traffic that the unit container can be used to advantage. Every railway man knows that one of the principal difficulties of operation is the unbalanced nature of the traffic, and in these circumstances alone the universal use of containers would be costly and uneconomic. If the flow of traffic, into and out of every town in the country was equal and balanced itself, they would be in quite general use in a short time.

Where a balanced bulk load traffic in both directions can be had, unit container equipment holds out great possibilities for saving in time and labor and thus a more economical movement than is possible by conventional methods. For instance, under a properly coordinated plan, a merchant with stores in several cities might use unit containers to great advantage. But, unless the containers can be loaded in both directions, the ultimate net saving will be very little and the venture may even turn out to be unprofitable, because the cost of transporting the empty is strictly waste effort. A container of light construction such as the duralumin one mentioned is therefore highly desirable from this as well as other standpoints.

Finally, I would caution all those concerned with transportation problems not to jump to conclusions about these matters. Each case where containers and demountable bodies may be used should be carefully analyzed from every angle, because almost every case is a special one, involving perhaps complications that do not appear on the surface but that can be satisfactorily solved through close study by transportation experts.

Meeting of Management Association

THE second annual meeting of the American Management Association at the Hotel Astor, New York City, Oct. 29-30-31, which will be devoted to the problem of human relations in commerce and industry, promises to be notable both in program and in attendance. Owen D. Young of the General Electric Company, is chairman of the general convention committee, and Martin Dodge, manager of the Industrial Bureau of the Merchants' Association, is secretary.

Among the topics to be discussed in the three-day session are economics for employees, job description and man specifications, labor-saving office equipment, distributing and utilizing the product of the public schools, selection of supervisory forces, scope and management of medical departments and use of motion pictures in personnel work. At the annual dinner on Oct. 30 "Stabilizing Prosperity in America" is the topic.

New England Street Railway Club to Meet Oct. 25

THE first of the season's meetings of the New England Street Railway Club will be held in the Swiss Room of the Copley Plaza Hotel, Boston, Mass., on Thursday, Oct. 25.

The afternoon meeting, called for 4 p.m., will be devoted to a series of fifteen-minute papers on the following subjects:

"The Lightweight Car," by J. C. Thirlwall, General Electric Company; "Air Brakes—Safety Devices as Applied to Light-Weight Cars," by E. W. Davis, Westinghouse Traction Brake Company; "Car Body Types as Applied to Light-Weight Cars," by Charles

F. Johnson, the J. G. Brill Company; "Automatic Substation Equipment," by J. P. Alexander, Westinghouse Electric & Manufacturing Company; "Joints—Seam and Surface Welding," by C. H. Wood, C. N. Wood Company.

At the evening meeting a number of reports, with discussion, will be given upon vital matters developed at the A.E.R.A. convention, as follows:

"General Operation and Allied Matters," by Edward Dana, Boston Elevated Railway; "Cars and Equipment," by W. C. Bolt, Eastern Massachusetts Street Railway; "Track—New Appliances and Practice," by H. M. Steward, Boston Elevated Railway; "Safety Work," by Fred A. Cummings, Eastern Massachusetts Street Railway.

particularly with reference to the correlation of taxes for this purpose with taxation of other transportation agencies. It is also suggested that this committee co-operate with the committee on national relations when any of these matters require a presentation to be made before a governmental body.

COMMITTEE ON VALUATION

It is recommended that this committee be continued. It should give further study to the question of the proper basis for valuations, with particular reference to the original cost basis and the reproduction cost basis. The committee should review current decisions of both courts and commissions for the purpose of following the trend, in view of the developments which are taking place in the legal interpretation of this subject.

The committee on education should be continued. It should give special consideration to the development of co-operative courses, both in electric railway operation as well as in electric railway economics with colleges, universities and technical schools. The extension departments of these institutions in many cases are in a position to conduct such courses for street railway employees. The committee should continue the work in this direction which was started by this year's committee.

It is recommended that the committee on insurance be continued and that it carry on the work of investigating the rates charged electric railway companies with a view to ascertaining whether a reduction cannot be secured. The committee may also consider such recommendations to member companies as will insure greater fire protection.

TRACKLESS TRANSPORTATION

The policy of the association with respect to the co-ordination of transportation service in each community has been well defined in the last two years. It is believed that the association may this year leave the matter in the hands of its affiliated associations with the recommendation that they study and report upon it from their respective operating standpoints.

It is recommended that a special committee be appointed to study the use of subways and elevated railways for city traffic.

It is recommended that a new committee be formed to study the elements of indeterminate franchises. It is generally believed that these have advantages over the usual fixed term franchise and all such facts should be considered in the report and recommendations of the committee.

It is recommended that a new committee on unification and co-ordination of all forms of local transportation be formed to consider the economics of transportation with respect to the needs of the community as a whole, having in mind both the electric railway and the motor bus. It should consider the economies to be effected by organizing all transportation facilities under one management.

American Association News

The Association's Program for 1923-24

THE committee on subjects and meetings met at Atlantic City with Chairman J. N. Shannahan presiding, and drafted the following report, which was submitted to the incoming executive committee of the American Association at its first meeting:

The committee recommends that the association devote itself primarily during the coming year to a continuing study of the broad subject of the relation of the industry to the public on one hand and to the government on the other. To carry out these subjects the following special committees are recommended.

There has been an effort in certain quarters to depreciate the value and utility of the electric railway. A definite program of work should be pursued to offset this propaganda and to stimulate electric railway companies in the development and utilization of modern equipment and facilities and methods. To carry out this work practically, it is suggested that two committees be organized—one on city operation and the other on interurban operation. The presentations which have been made under the Charles A. Coffin Award by a group of seventeen companies are ample evidence of the progressive spirit of the industry.

COMMITTEE ON PUBLICITY

This committee should continue to co-operate with the committee of one hundred and with the special committee of manufacturers, and direct and advise the advertising section of the headquarters organization in conducting the general publicity program. Particular attention is called to the need for more public speaking by executives of member companies, both railway and manufacturers, and it is suggested that the committee promote work along these lines during the current year. One method by which this can be accomplished is through encouraging the closest possible co-opera-

tion between the headquarters organization and the various state committees on public utility information and the work which the latter are doing in securing public speakers in their local districts.

It is recommended that a special committee be appointed to study the subject of regulation as it exists in the various states, and to ascertain whether it is not feasible to prepare a general outline of the principles which should underly the regulatory laws controlling the industry in the various states. The purpose of this study is to secure if possible a greater degree of uniformity in both the control and regulation of all phases of the transportation industry, as well as to provide greater protection against unjust competition. This committee should co-operate with similar committees of the other utility associations in considering a possible uniform public utility law.

COMMITTEE ON SPECIAL TAXES

This committee should be continued. The report this year set forth very clearly the elements of special taxes and other imposts levied upon electric railways. The next work of this committee should be to indicate the lines along which efforts should be directed to secure relief from such tax burdens.

It is also recommended that this committee investigate and report on the factors which electric railway companies should properly take into consideration in endeavoring to secure relief from the excess profits tax, which has been improperly placed upon companies in certain instances. This should cover a consideration of the rulings of the Income Tax Bureau regarding depreciation accounting on ways and structures and the question of entering up depreciation appropriations by electric railways under a ruling similar to that allowed in the case of national banks. It is further suggested that this committee study and report upon the general question of a taxation program for highways,

The News of the Industry

High-Speed Electric Line to Atlantic City Does Well

It is reported that the proposed lease of the West Jersey & Seashore Railroad by the Pennsylvania Railroad may be effected on a 5 per cent dividend basis after the declaration of a 25 per cent stock dividend. The committee representing the West Jersey's shareholders is understood to desire a 30 per cent dividend, while the Pennsylvania Railroad's representatives are of opinion that a 20 per cent stock dividend will cover the amount of earnings placed back in the property over a period of years.

The estimated property value of the West Jersey & Seashore Railroad, which operates a line from Camden to Atlantic City and Cape May, with several branches, 69 miles of which are operated electrically, is \$31,000,000. Its funded debt is \$7,000,000 first consolidated sinking fund 3½s and 4s, due July 1, 1936, of which \$5,767,000 are outstanding, and \$24,816 equipment trust obligations.

It has authorized \$13,000,000 of \$50 par value common stock and \$104,000 special guaranteed \$50 par value stock. There is outstanding \$11,586,250 of the common stock and \$88,400 special stock. The Pennsylvania Railroad owns \$6,747,900 of the common stock and \$45,350 of the special stock.

With the exception of 1906-07, when 6 per cent was paid, dividends on West Jersey common have never run higher than 5 per cent since 1896. Earnings on the issue, however, have gone as high as 11 per cent or more, the greater part of which was placed back in the property, thus enhancing the property value.

The road's earnings this year, based on reports published for the eight months ended Aug. 31, are expected to run above 12 per cent.

Republicans of New York Attack Governor Smith's Municipal Ownership Program

Formal announcement has been made through the Republican State Chairman of New York of the campaign plans to retain control of the 1924 Assembly. Theodore Roosevelt, assistant secretary of the navy; United States Senator James W. Wadsworth, Jr.; former State Senator Nathaniel A. Elsberg, and Speaker Machold will all camp on the trail of Governor Smith, who is calling upon the voters for a democratic Assembly so that his policies may be enacted. In opening in campaign for the democrats more than a week ago

in Rochester the Governor assailed what he described as the policy of the Republican legislative leaders to hamstring his legislative program.

State Chairman Morris, in disclosing plans for the Republican campaign fight, assailed what he described as Tammany's efforts to seize the machinery of state government. He said:

One would think that Governor Smith, who is supposed to know something about business, would go slow on the subject of municipal operation. The Republicans hold fast to the principle of state regulation of public utilities. The political history of the state shows that it was the Republicans long ago, under Governor Hughes, who stopped the corrupt bargaining between Tammany and the public service corporations. Tammany this year at Albany obstinately clung to its determination to have municipal ownership and operation and complete control of contract letting. With one it would supply an army of employees. With the other it would enrich its leaders.

Convention Party Returns by Motor Bus

For those who were fortunate enough to participate in it, an interesting and novel finish to the convention of the American Electric Railway Association was the trip from Atlantic City to New York City in the "Corinne," one of the six Safety Coaches exhibited by Frank R. Fageol, Oakland, Cal. This parlor car-observation coach, which is to be turned over to the Chicago, North Shore & Milwaukee Railroad on its arrival in Chicago, started from the Marlborough-Blenheim Friday, Oct. 12, with all seats taken but two. Mr. and Mrs. Fageol, who were aboard, had as their guests Mr. and Mrs. Robert B. Stearns, Boston; Mr. and Mrs. Edward Dana, Boston; Mr. and Mrs. W. E. Jones, Providence; Mr. and Mrs. S. H. Anderson, Los Angeles; Mrs. M. A. Philo, New York City; Mr. Claus Spreckels, Coronado; M. McCants, San Francisco; R. C. Smith, Los Angeles; J. H. Handlon, San Francisco; J. M. Yount, San Francisco; V. E. Keenan, Providence; Douglas W. Dodge, San Francisco; J. B. Daly, New York.

A stop was made at Biggett's—some where in New Jersey—for luncheon, and while it was being prepared Claus Spreckels was persuaded to play the piano and sing a few operatic selections. There was also dancing, at which J. H. Handlon proved to be a near rival of Nijinsky, and J. M. Yount at least an understudy for Maurice.

As the "Corinne" neared New York wagers were made on the miles traveled, on length of time it would take from the ferry to the Commodore, on the exact minute the coach would draw up in front of the hotel and come to a stop and on several other risks. Altogether it was a thoroughly delightful trip.

High-Speed Operation Out of Boston

A rapid transit line approximately 8 miles long from Harvard Square to Peabody Square, Dorchester, is assured by the decision of the trustees of the Boston Elevated Railway to revise plans for the absorption of the Shawmut branch and its incorporation in the Elevated system and run Dorchester Tunnel trains to Ashmont.

The Legislative act, authorizing the city of Boston to buy the Shawmut branch and lease it to the Boston Elevated Railway made no specific provision for service beyond Welles Avenue, save to decree that the Elevated must guarantee adequate service for the people of Milton. Originally, the Elevated had merely announced extension of the Dorchester Tunnel train service from Andrews Square to Fields Corner, with single-car service to Milton.

The Legislature, however, left the Boston Elevated Railway wide latitude in working out plans for service beyond Fields Corner, and the trustees have decided that for reasonable expenditure the rapid transit service can be extended to Peabody Square. Mayor Curley has urged that this be done.

The plans of the Elevated call for the depression of the Shawmut branch road-bed to eliminate five grade crossings. Elevated trains will run over the right-of-way of the Boston Division of the New Haven Road, paralleling the railroad tracks, beyond Andrew Square where the Shawmut branch begins.

Plan to Utilize Railroad as Part of City System Impracticable

The Committee of One Hundred has been told by George Le Boutillier, now president of the Long Island Railroad, that its program for improved transit service within the city limits of New York would cost about \$250,000,000 and that it is impracticable in other respects. The committee has been working with the members of the Transit Committee of the Brooklyn Chamber of Commerce. Mr. Le Boutillier says that entirely aside from the economic impracticability of any such intricacy development as is proposed, and the impossibility of securing charter and franchise rights, it would be futile for the Long Island Railroad to attempt to transform its railroad into a combination of a city rapid transit system and a non-rapid transit system, caring for suburban and long-distance passengers and the transportation of freight. The two kinds of business are fundamentally different. The facilities to serve them cannot be combined.

Boston "L" Wages Advanced Nine Cents

Arbitration Board Award Retroactive to July 1 Will Cost Company \$2,000,000 a Year—Request for Shorter Work Day on Sunday and Holidays Denied

An increase of 9 cents an hour over the present wages has been awarded to trainmen of the Boston Elevated Railway. This is the decision of the board of arbitration handed down on Oct. 15. The opinion of the board is that the circumstances justify a return to the rate fixed by the Doherty award of 1920. In consequence the maximum rate fixed for motormen and conductors of two-men surface cars is 70 cents an hour for an eight-hour day.

As for the differential above the rate of wages awarded to motormen and conductors of surface lines to be paid to operators of one-man cars and buses, the board has decided that it shall remain at the present rate of 8 cents an hour. On the request for a shorter work day on Sundays and holidays, the board has answered in the negative. The belief is expressed, however, that this matter should be the subject of further negotiations between the company and the men for the purpose of seeing if the desired object cannot be accomplished by the men making some concession and assuming at least a part of the burden. The board says it became evident at the hearing that the management of the road was in sympathy with the desire of the men for a shorter work-day on Sunday, but was prevented from granting it only because of the great expense it would throw upon the company.

The award is retroactive to July 1, 1923, and continues in force until July 1, 1924. The back pay is to be paid by the company by Dec. 15. Any questions that arise between the parties as to the meaning of any of the provisions of the award are to be referred to the board for determination. The rates established by the award are carried out through all the grades and classes of employment.

STILL GREATER CO-OPERATION NECESSARY

Edward Dana, general manager of the Elevated, made the following statement concerning the award:

The arbitration award means an increase in operating costs on the basis of present service and operating conditions in the vicinity of \$2,000,000 annually.

The estimated balance above the cost of service for the year ended June 30, 1924, amounted to \$1,278,000 on the basis of existing wage rates, which amount would have been available for repayment to cities and towns.

The award therefore means that, if present conditions are continued, such a repayment is prevented and the excess of several hundred thousand dollars must be met.

This calls for large efforts, but the trustees will face the coming year in the belief that the members of the organization benefited by the award will do all in their power through increased efficiency and co-operation to meet the conditions imposed, and that by united efforts of men and management it may be possible to do so.

Although the arbitration agreement submitted five questions for decision, it became unnecessary to consider the

fourth and fifth, and the first three only are dealt with in the report.

The first question was: "What rates of wages shall be paid to all of the employees of the company who are members of the Association?"

The parties agreed that in dealing with this question, the arbitrators needed only to determine the maximum basic wage to be paid to motormen and conductors of the two-men surface cars; and that when this was determined in the form of cents per hour, the parties themselves would be able, according to a rule of percentage or addition which they have adopted, to determine all the other rates of wages involved in the arbitration. The board adopted this suggestion.

MEN ASKED THIRTY-CENT INCREASE

The maximum basic wage of motormen and conductors of two-men surface cars has been 61 cents an hour, for an eight-hour work day. This is not the highest rate the company has ever paid. From May 1, 1920, to June 30, 1921, the rate fixed by a majority of a board of arbitrators of which the late James L. Doherty was chairman, was 70 cents an hour. It was gradually reduced to the present rate by voluntary agreement between the company and union.

The men asked that this wage be increased 30 cents, or to a total of 91 cents an hour. In support of their claim they urged that the present trend of wages throughout the country was upward; that costs of living which fell off during the period of business depression were again advancing; that reasonable standards of living for laboring men were higher than they have ever been before; that the maintenance of this higher standard was wise as well as just; that they asked no more than others were receiving in comparable employments; and that the outlook for improved financial conditions justified their demand for more generous treatment.

The company, on the other hand, denied that the increase demanded by the men was reasonable or practicable. In support of its contention, the company urged that wages had more than kept pace with the increased cost of living; that the reductions of wages since 1920 had been proportionately much less than the falling off in living cost; that in many comparable occupations the wages paid were lower than these men are now receiving; that little dependence was to be put on theoretical budgets prepared to show cost of living; and that any large increase in the present wages would tend to throw an unfair burden upon those who ride on the cars and upon tax payers who, under the present law, must make up any deficit that results from the operation of the road.

The board said that both views were urged with great force and skill by the arbitrators who represented the company and the men, and there was so much of truth in each contention, that it was no easy task to find their proper resultant. The board said:

It would probably be unfortunate for all concerned if we adopted a standard of wages that would necessitate an increase of fares beyond the present 10-cent rate. It is not believed that the increase granted in this award will have that result. On the other hand, there seems to be little justice in demanding an immediate return to old prices for transportation when every other product of human industry has increased in price. It seems clear also that the fixing of wages on a fair and somewhat permanent basis ought to precede rather than follow, reductions in fares, in order that all the elements of the problem may be known when reductions are under consideration.

One would be blind to the obvious tendencies of recent times, if he did not observe the marked disposition to treat labor with greater liberality. Labor is no longer regarded as a mere commodity, to be bought at the lowest competitive price. The old idea of an irrepressible conflict between labor and capital is losing its prestige, and giving way to more enlightened thought. It is to be hoped that the earnest study of economists may ultimately provide us with a rule that will settle all difficulties. Today every step that promotes harmony rather than discord, that encourages co-operation, that substitutes arbitration for the strike, ought to be met in a liberal spirit. Especially is this so when the employer is a public or quasi-public body.

We wish to make it clear that the decision we have reached is not governed by any rule that requires a wage adjustment to meet a mere increase in the cost of living. In the opinion of a majority of the board such a rule would not justify the increase granted. It would be a misinterpretation of this decision, to attempt hereafter to say that the scale should move up or down according as the percentage of living cost should rise or fall. We have taken into consideration not merely the cost, but also the standard of living.

The things that have had especial weight in this decision are (1) the scales of wages now paid by public bodies in comparable employments, such, for example, as police and fire departments, (2) the wages paid in comparable private occupations, particularly the building trades, (3) the most reliable studies of family budgets regarded by economists as tending to fix what is known as the American Standard of Living, and (4) the wages fixed for certain street railways in two of the largest cities in the country, Chicago and New York.

The chairman was of the opinion that in those cases where the operator must collect the fares, make change and issue transfers, the present differential of 8 cents an hour was inadequate; but both sides agreed that it would not be practicable to have two separate rates for one-man cars. It was testified that at the present time about 25 per cent of the runs was made by one-man cars, but in 80 per cent of the one-man car traffic, collection of fares on the car was not required. In view principally of the fact that the one-man car operator was given, in common with other car men, the increase of 9 cents an hour granted by the award, it did not seem to the board that it would be justified in raising the differential as to all the operators of one-man cars on the line.

Charles W. Mulcahy, for the company, joined in signing the award as he agreed with the decision of the second and third questions submitted to the board, namely, the differential to be paid to operators of one-man cars and the hours of labor on Sundays and holidays, but he dissented from the decision of the first question granting the increase in rates of wages.

Want Service-at-Cost Amended in Toledo

Initial steps toward amending the Milner service-at-cost plan of electric railway operation at Toledo have been taken by the City Council. At a recent meeting a motion appointing a committee to confer with the city law director and the Doherty interests was passed. Councilman Emch, who fathered the idea, said the principal point to be considered was the increase in depreciation fund from 1½ per cent maximum limit to 5 or 5½ per cent of the invested capital, as suggested by Commissioner W. E. Cann. Mr. Emch would also establish a surplus fund from which minor improvements and additions could be financed instead of by means of additional 8 per cent preferred stock.

At the present time the depreciation fund is one in name only, setting up merely enough to cover a few changes, track removals, and such work. Maintenance funds are more elastic and cover a portion of the field usually allotted to depreciation.

It is doubtful whether much can be done to change the ordinance as the original intention of the business men who framed it was to provide for new capital through the issuance of preferred stock and not make a direct charge upon the car riders.

Texas Interurban Restrained Permanently

The Texas Interurban Company of Dallas has lost its fight in court against an injunction restraining the company from constructing tracks on Fairmount Avenue over which the connection with the Missouri, Kansas & Texas Railway is to be electrified between Dallas and Denton. A temporary injunction against the company, preventing it from laying tracks on Fairmount Avenue, was granted by Judge Louis Wilson several months ago, after the city of Dallas had granted a franchise authorizing the company to build the line on Fairmount Avenue.

The recent hearing before Judge Wilson was on a motion by the Texas Interurban Company, which will build the electrified Katy line to Denton, for dissolution of the temporary injunction. Judge Wilson declined to dissolve the injunction, but issued an order making it permanent. The interurban company gave notice of appeal, and in the meantime all work on the project of electrifying the Katy is being delayed pending final settlement of this controversy.

Since it appears probable that the interurban company will be permanently enjoined from building its line on Fairmount Avenue, it may be necessary to select some other route for the Denton interurban cars to enter the city. In this connection, W. M. Whitenton, in charge of operations of the Missouri, Kansas & Texas in Texas, announces that it would be agreeable for the interurban company to use the tracks of

the Katy into the city. Although the newly proposed line of entry may not be regarded as favorably as the Fairmount Avenue, because it would not serve a district of the city now without street car facilities, this entry into the city could be made with far less expenditure than the proposed Fairmount Avenue line.

Working Out Details for Elimination of Grade Crossings in Los Angeles

In view of the many grade crossing accidents in Los Angeles County during the past eighteen months committees recently appointed by the California Railroad Commission, county engineers and engineers from city governments, together with officials and engineers of steam and electric railroads, have met to evolve plans for the separation and elimination of grade crossings in Los Angeles city and county.

It was found that cost of elimination would be from \$25,000 to \$250,000, but in a majority of cases the general average would be approximately \$50,000 per grade crossing. It was pointed out that to the rapid real estate development in southern California there is attributed much of the evil of the grade crossing, whereas the Pacific Electric representatives cited figures to show at present the interurban company has 1,200 grade crossings with highways on its lines.

It is viewed that the cost of eliminating the grade crossings and the proportion thereof is to be borne by the railway companies, the state, the county of Los Angeles, the city of Los Angeles or the interested property owner involved. Methods of financing the cost of the proposed improvements are to be considered. The lessening of the cost of maintaining the crossing, the element of time saved by the railroads and the saving of outlay for damages, together with numerous other factors, would be used in determining the amount the railway companies should pay for the improvements. In the event there is a deadlock in determining the method of allocating the grade crossing elimination expense, it is left with the State Railroad Commission, as the governing body, to establish an equitable manner for proportioning the expense among all involved.

In order to determine the most dangerous grade crossings that should be eliminated each steam and electric line operating in Los Angeles County was requested to furnish a list of grade crossings that it maintains in the county, suggesting the five grade crossings which, in its judgment, are the most hazardous to the company itself and to vehicular traffic.

On Aug. 31 the full committee met and reviewed the list of twenty-three of the most dangerous grade crossings in Los Angeles and vicinity, specified by five railroads, whereby immediate steps are to be taken toward the elimination of ten of these.

South Jacksonville Knew What It Wanted, Then Went After It

The residents of South Jacksonville, Fla., have had the following puzzle to solve: "If a city is too small to support a street car company, and if it cannot grow unless it has the street cars, how can it get them?" The answer, as they see it, is to sell \$100,000 of city bonds, buy four cars, have an experienced construction firm lay the tracks, and arrange for the company in the adjoining city to operate the cars economically.

South Jacksonville, just across the St. Johns River from Jacksonville, has 5,000 inhabitants, lots of ambition and a new county bridge across the river to its big sister city. When the bridge was built car tracks were included, in the hope that some day they would be used, but a study by E. J. Triay, receiver of the Jacksonville Traction Company, proved that an extension of track and service into South Jacksonville would at first be a money-losing proposition.

So the business men and officials got to work, sold \$100,000 of municipal bonds voted for the purpose and were ready to buy what they needed—a street car system which they expect will bring profit to them and their city through increased population, higher property values and greater general activity.

An unusual feature of the plan is that although the new line will be municipally owned it will not be municipally built or operated. The construction contract has been placed with Stone & Webster, Inc., of Boston, and another contract has been signed with E. J. Triay, receiver of the Jacksonville Traction Company, to operate the cars and charge the city on a mileage basis. The negotiations to this end were referred to in the *ELECTRIC RAILWAY JOURNAL* for May 19, page 859.

Wages Advanced.—The Quincy Street Railway recently announced a pay increase effective Oct. 1. Under the plan new conductors and motormen will receive an increase of from 37½ cents to 40 cents an hour. Old conductors and motormen, with three years' service and over, a short time ago received a raise of from 42½ cents to 45 cents.

Will Seek Paving Relief.—The Legislature of Iowa will be asked to eliminate the paving tax on electric railway lines and to provide that the cost of paving fall on the property owners abutting or that it be paid out of a general fund, according to information from Davenport. This bill will be backed by all the street car companies in Iowa and will also have the backing of the general utility interests. The street car operators claim that the paving tax is now one of the big burdens which is steadily tending to break their financial backs. In Davenport, for instance, the Tri-City Railway claims that of every 8 cents which it receives in fares 1 cent must go to pay for paving or for the interest on depreciation of paving.

New Location for McGraw-Hill Company of California

The offices of the McGraw-Hill Company of California in San Francisco will be moved on Nov. 1 to a new location in the Mohr Building, 883 Mission Street.

Competitive Five-Cent Fare a Failure

Uzal H. McCarter, a director of the Public Service Corporation of New Jersey, in a speech made on Oct. 16 said the 5-cent fare being charged for an experimental period on the local lines of the railway in the principal communities is a flat failure. He said the 5-cent fare with the railway and jitney service co-ordinated is the proper rate and would solve the transportation problem. Service has been fully restored by the railway since the strike, but the loss to the railway represented by the falling off in patronage over the pre-strike period is \$10,000 a day. Mr. McCarter charges the present transportation difficulties to the failure of the city and state officials to enforce the laws regarding the operation of buses. He was afraid that the efforts at enforcement now being made would take too long to carry out.

John L. O'Toole, vice-president, speaking for the railway, said that the company was not ready to make public the figures regarding the new fare, which has been in force only since Oct. 1.

Commission Given New Power.—Governor Brandon of Alabama, recently approved a bill giving authority over utilities engaged in interstate commerce to the Alabama Public Service Commission. The commission had previously had jurisdiction only over utilities engaged in intrastate commerce.

Japanese Studying Transit Conditions.—Mitsuru Ishii, chief secretary, Municipal Electric Bureau of Tokyo, and K. Murakoshi, assistant secretary of the Japanese Government Railways, are studying the transit conditions in various cities throughout the United States and are looking into the field of motor transportation.

Votes Against Extension.—The public utilities committee of the Board of Supervisors of San Francisco recently voted down a resolution to prepare plans and specifications for the construction of a proposed extension of the Municipal Railways from Cole and Carl to the beach. A number of residents of the Sunset district were on hand to request the building of the new line.

Offices Moved.—The general offices of the receiver of the Long Island & Queens County Railways have been removed from 7-9 Borden Avenue, Long Island City, to 36 Twenty-fifth Street, Jackson Heights, Long Island. The offices of the New York & Queens County Railway also do the accounting and auditing of the Long Island Electric Railway and the New York & Long Island Traction Company.

Colonel Perkins Elected Officer of Veterans Body.—Col. Albert T. Perkins, manager of the United Railways Company, St. Louis, was elected junior vice-commander of the Military Order of the World War Veterans at the annual convention held in Washington, D. C., recently. During the war Colonel Perkins served as director of light combat railways for the army in the San Mihiel sector.

"Partners" Expands.—**"Partners"** now carries the monogram of the Texas Interurban Railway at its head, along with that of the Dallas Railway. Effective with the Sept. 20 issue, the Texas Interurban Company became associated with the Dallas property in the publication of this pamphlet. The editor of **"Partners"** is anxious to get news from the Interurban and has asked that the dispatchers serve as editors for this department.

Agree on Joint Arbitration.—Track employees of the Chicago Surface Lines returned to work on Oct. 8 after being on strike since Sept. 12. The men had insisted that the company agree to arbitrate with limitations which would have compared them with building laborers instead of track laborers. They finally agreed to the company's terms, namely, to go into the joint arbitration with the other unions without any limitations. The arbitration proceedings will start on Oct. 22 covering the various trades working in the shops and wreck wagons as well as the track men. About 1,200 track laborers were involved in the strike, which did not affect the company's service.

Company Wins Niles Fight.—Judge Cole sitting in Warren on Oct. 3 made permanent the temporary injunction restraining the city of Niles from further removing the tracks and held the Pennsylvania-Ohio had authority to relay the rails torn up at Cherry Street and at the switch in Robbins Avenue. In less than twelve hours after the decision had been given track gangs had repaired the tracks and through service was being given. In rendering the decision Judge Cole recommended that both parties take their fight before the Public Utilities Commission. The controversy between the city of Niles and the Pennsylvania-Ohio Electric Company began several months ago when the company refused to pay for repaving of Robbins Avenue, which according to the Niles officials it had contracted to do.

"Transportation News" Makes Début.—In order that employees of the New York State Railways may become better acquainted with one another and that each may know what the other is doing, the company has started the publication of **"Transportation News."** The first issue, under date of August, 1923, has been dedicated as a token of respect and esteem to James F. Hamilton, president. Hereafter the book will appear every month. In the first issue, Mr. Hamilton, in introducing the publication, says that he hopes in the pages answers will be found to questions that have been in the employees' minds, and

that they will find subjects of interest in the magazine. The editor of the paper is A. W. Koehler, who is the director of safety of the New York State Railways.

Car Problem Subject of the Hour.—Interest is keen throughout Anderson, S. C., looking toward a solution of the car problem in that city. President Sullivan of the Chamber of Commerce has named a committee to discuss the car situation with the City Council. Manager H. A. Orr of the Southern Public Utilities Company, which operates the electric railway system in Anderson, was recently in receipt of a letter from James N. Pearman, a member of the South Carolina Railroad Commission, in which Mr. Pearman commended the manager of the company for taking up the matter with the citizens. He also expressed the hope that some arrangement could be made which would continue the service for the people of the city.

Has Adopted Bonus Plan.—The quarterly bonus plan which has been in operation for the past two years by the Wisconsin Public Service Corporation, Green Bay, has been adopted by the Menominee & Marinette Light & Traction Company. The plan to institute this policy in Marinette was made following the return of Green Bay trainmen who attended the safety meetings. The Green Bay bonus plan, which has attracted state-wide as well as nationwide attention, is a constructive effort to secure "safety, courtesy and service" for the traveling public. Mother's Day is celebrated as "Dress Up Day" in Green Bay and theoretically the quarterly bonus, the additional individual bonus for D credits and the annual bonus permit each employee to purchase a new uniform for the amount that he can save through the regular daily practice of safety, courtesy and service to the street car riding public.

Reports on Santa Fé Electrification.—A survey of hydro-electric possibilities on the Colorado River has recently been undertaken and completed by engineers of the Santa Fé System. The study was made with a view of determining whether it is feasible to electrify the trans-continental lines in that section of the desert country on the Pacific Coast as traversed by the Santa Fé System. These facts were brought out recently in an address by W. B. Storey, president of the Santa Fé Lines, before the Chamber of Commerce at Pasadena. Mr. Storey said that the officials of the Santa Fé had been following the progress of the Chicago, Milwaukee & St. Paul Railroad in electrification of its northern lines with perhaps more interest than any other road. He stated that his company had limited resources for hydro-electric power, which meant cheap power, but that his engineers had completed a survey of the possibilities in that direction on the Colorado River, and while there were no definite plans at this moment concerning electrification, the question might come up in the near future.

Foreign News

Increased Fares May Continue in Britain

There are in existence two post-war emergency acts of Parliament permitting tramway undertakings in Great Britain to charge higher fares than the previous statutory maximum of a penny a mile. These are the statutory undertakings (temporary increase of charges) act, 1918, and the tramways (temporary increase of charges) act, 1920, and they expire on Dec. 31, 1924. The Ministry of Transport has, however, intimated that it is the intention of the government to include the former act so far as it relates to tramways and also the latter act in that schedule of the expiring laws continuance bill of 1924. This will have the effect of continuing the operation of the two acts for another year. When the time comes, should the course appear desirable, the government will be prepared favorably to consider the inclusion of the two acts also in the expiring laws continuance bill of 1925.

Tramcar vs. Bus in England

H. Mattison, general manager of the Manchester Corporation Tramways, has presented to the tramways committee of the city a long report on the respective merits of the tramcar, the petrol bus and the trackless trolley bus, more especially in the conditions prevailing in large cities. The conclusions at which he arrives are to the following effect:

1. The motor bus is the best and most economical vehicle for any service not requiring a greater frequency than four vehicles per hour, operating on the basis of fares of three quarters of a mile for 1d.

2. The trackless trolley bus is the most economical for services of from four to six vehicles per hour, carrying seventeen passengers per mile at a fare of 1d. per mile and operating sixteen hours per day.

3. The tramcar is undoubtedly the most generally satisfactory vehicle for services of six or more cars per hour and when it can operate for eighteen hours per day, carrying an average load of twenty-five passengers per mile, and at fares based on 1 mile for 1d.

The tramways committee, after considering the report, stated that it was satisfied that the policy hitherto pursued had been fully vindicated. That policy has been to develop to the fullest extent the tramway system of the city and surrounding districts and to utilize the motor bus as a feeder to the tramways. Terminals already established will reduce the tramway traffic in the central area. In the opinion of the committee the motor bus cannot be considered either as a practical or

financial substitute for the tramcar for passenger transportation either for the city and districts or for the central area only.

The City Council has approved these reports.

Accidents in London Streets

A return issued by the London Metropolitan Police shows that during the three months April, May and June of this year no fewer than 171 persons were killed in street accidents in London, and the total number of accidents was 18,028. The following table shows the details in regard to each kind of vehicle concerned:

Type of Vehicle	Persons Killed	Accidents
Mechanically propelled:		
Omnibuses	18	1,391
Tramcars	6	1,086
Cabs	5	1,001
Private motor cars	51	4,445
Motorcycles	13	1,638
Trade and commercial	60	3,391
Traction engines		10
Horse drawn:		
Omnibuses		1
Cabs		15
Broughams		66
Trade and commercial	10	2,159
Pedal cycles	7	2,784
Horses ridden or led	1	41
Totals	171	18,028

Style in Station Buildings

The London Electric Railway is doing everything possible in connection with its rural extension line now under construction from Golden's Green to Edgware not only to secure efficiency but to minister to the comfort and the taste of the public. In the latter direction an example is found in Brent Station, the first one on the extension, which is approaching completion. It is designed in Georgian style and will harmonize well with its rural surroundings. Approached by a broad macadam forecourt, the station consists primarily of a booking hall 50 ft. square, entrance being effected through a Portland stone portico formed of coupled Doric columns. A touch of color will be given by the use of sand-faced bricks of varying tones of red and purple which will contrast pleasantly with the white stone of the portico. The roof is covered with Italian tiles and has wide projecting eaves. The booking hall floor is covered with large black and white non-slip tiles, and the walls are also tiled out in panels to provide neat spaces for advertisements, thus preventing the disfigurement of the station by the haphazard posting of bills.

The platforms being about 15 ft. above the level of the roadway, the trains are approached from the station through a short subway under the viaduct and then up a flight of stairs on to the platforms.

The booking hall will be equipped with three of the latest pattern passimeter booking booths constructed in oak and harmonizing with the booking hall.

Consolidated Paris Surface Car Lines Are Improving Their Facilities

What is known as the "Transports in Common of the Paris District" has combined all surface lines of passenger transport and the flyboats on the Seine between the stations above Paris to those just below the fortifications. The last two privately owned surface lines to be absorbed are the Bois de Boulogne Railway and the Paris-Arpajon Suburban Railway. In conformity with a decree of July 8, 1922, and another of Nov. 20, 1922, this brings all passenger transport within the Paris limits and that of the Department of the Seine under one general control.

By an intensive utilization of rolling stock the traffic has developed considerably during the past fiscal year. Passengers carried were 917,723,233, an increase of 5.1 per cent as compared with 1921 and receipts were superior to the extent of 10.8 per cent, reaching the figure of 297,128,574 francs.

Operating expenses are being reduced where possible by an increased car-kilometrage and the best possible utilization of the traveling personnel, which is not to say that wages are likely to be reduced or the force reduced in numbers, simply a more efficient application of man and car power being called for.

During the past year car lines starting from central points in Paris have been greatly modified as to their itineraries and in many cases prolonged to the fortifications and in some cases beyond, whereas formerly they stopped at the octroi barriers. Upkeep and construction have kept pace with the new demands, under control of government inspectors. A new program of amelioration and extension is in progress which will call for the expenditure of 367,000,000 francs, of which 100,000,000 francs is already engaged.

Track has been put into good condition over 147 km. of trolley overhead lines and there have been laid 3.4 km. of track with underground electrical contact with 13 km. of new overhead trolley constructed.

During the past year there were built forty-one motor cars, 100 trailers, sixty-two motor buses of four wheels and fifty auto buses of six wheels. A new and lighter electric motor has been adopted which permits an economy of electrical energy and 250 cars of this type have been ordered.

The flyboats on the Seine, which were taken over during the war from a company which had been in existence many years, number thirty-four as having been reconconditioned, with eight others ultimately to be put in service. These flyboats serve twenty-eight pontoons or wharves and fifteen others are to be added as circumstances permit.

Berlin Recasts Its Municipally-Owned Railways

When a city of two and one-quarter million population actually shuts down its municipally owned street railways, as Berlin did for a short time last month, because no possible rate of fare makes the business pay, the American operator is entitled to a more convincing explanation than the easy hypothesis that politics must be at the bottom of it all. The real politics in the case is the downfall and practical annihilation of the German mark. There was some overstaffing of the municipalized street railway following the war because of unemployment among veterans, but more fundamental causes were the uneconomical rolling stock, the competition of the government railways in fares and of the direct-routed subways in service, and, worst of all, the wasteful routing taken over from the original private operators.

In seeking a remedy, the suggestion was made to follow other German systems by bringing private capital and management into partnership. It does not seem, however, that the coal and iron millionaires (gold, not paper marks) are anxious to fill a bottomless pit. What the city system did, therefore, in making its snap suspension of service on Sept. 7, was to place the affairs of the railway in the hands of a limited company or board of trustees composed of eleven city officials and one expert adviser. This board was given the authority to take the most drastic measures necessary. What has it done?

The board has no money for modern rolling stock and train operation of sufficient capacity to make the item of platform expense approach the more efficient ratio of the steam and electric rapid transit lines. The latest motor car seats only twenty-three passengers! It has, however, extended the use of one-man cars to at least nine light-traffic routes and no doubt will go further. Far more important than this has been a plan which is not so much a rerouting as an actual recasting of the entire system. One way of judging its thoroughness is to state that the first act of the trustees was to discharge the force of 11,000 men on two weeks' notice and to rehire only 4,000. Most of the others have been placed elsewhere by the city. The working day was lengthened by one and one-half hours and payment was based on platform time, with no allowance for waits between swings. The next step was to cut down to 100,000 car-km. (62,500 car-miles) a day to care for a traffic of 750,000 passengers a day on the basis of fifteen-minute normal and seven and one-half-minute rush-hour headways. This means that the railway expects only 275,000,000 riders a year, which is but one-half of pre-war times, not to mention the maximum of 900,000,000 riders in 1918-1919. Until the last year or so, the surface railways carried about one-half of the total traffic, so the significance of this fall can be appreciated.

In explaining the rerouting—the most important question of all—it is necessary to go back to the policy of the predecessor private company. Berlin was one of the few large cities in Europe built upon an American flat fare basis. But unlike American systems, the Berlin management was determined by all means to avoid the transfer. To make good its boast that a single fare would take the rider without a change of cars to any part of town (except in some western suburbs), the company had to adopt routings which became more and more circuitous as the city expanded. Aside from this, it was practically Gospel that every route must traverse the congested center.

Thus there came about a fearful and wonderful array of overlapping, round-about and partially duplicating routes. The earlier efforts of the municipal railway, as the after-war pressure began to hurt, were confined to cuts in service and abandonment of the poorest lines. The present scheme is entirely different. All the available track was envisaged as a whole and then thirty-one routes were laid out on the entirely new basis of carrying the rider the shortest possible way to his destination whether he requires one car or two. Thus it has come to pass that the most important fare in Berlin is now the fare receipt providing for a one-time transfer privilege. On Sept. 11 the price of this fare with transfer was a mere 400,000 marks, while the single fare cost 350,000 marks. In other figures, the transfer costs some 15 per cent extra. The abandonment of weekly cards and other prepaid transportation will be understood when it is mentioned that no longer ago than November, 1922, the Berlin single fare was 30 marks and the fare with transfer 45 marks. Truly, it is an amazing and pathetic situation.

Electrification of Austrian Railways

There were 256 km. of the Austrian Railways already electrified and in operation on Aug. 1, 1923; 217 km. were being electrified, and it was proposed to electrify 408 additional kilometers. Approximately 17 per cent of the present total railway mileage of Austria is either electrified, under course of electrification or proposed to be electrified. In all it totals 881 km.

"Safety-First Mirrors"

Twenty Metropolitan Electric Tramway Company (London) cars have been experimentally fitted with mirrors to enable alighting passengers to see any vehicle which may be coming up behind them. In alighting, passengers have their backs to oncoming traffic, and these mirrors should therefore be of considerable assistance in minimizing the dangers of the road. If the experiment proves successful, all cars will be similarly equipped.

French Feeder Lines Being Electrified

Suburban traffic of railroads as it is known in the United States is practically non-existent in France. The same is true of interurban surface lines to a great extent. The electrification plans which were started in France a couple of years ago have not yet come into being with respect to the main line railways and only on the Orleans line out of Paris and on the State railway to Versailles is there anything which suggests that France is thinking about electrification.

The Paris, Lyons & Mediterranean Railway and the Midi Railway are in the forefront of electrification schemes. The former has just applied for a concession for establishing a hydro-electric power plant which shall furnish power for the mid-France line 100 km. in length, running through a mountainous country from Langogne to Alais.

More nearly completed is its international section from Culoz to Modane on the Italian frontier, which is the first to be operated by electricity, the company being assured the necessary power by arrangement with the Société d'Electro Chimie, d'Electro Metallurgie et des Aciéries Electriques d'Ugine in the high Alps. Primarily the latter company was an outgrowth of an electric steel plant which by the foresight of its directors anticipated the future possibilities of electric power generated by the water power of the Alps, and today sees the reward of its enterprise by being able to sell its unlimited current to one of the most important and the lengthiest of railways being operated in France.

The same company is laying out the system which shall ultimately furnish the current for the branch lines from Carnoules to Grasse, Cannes, Nice and Vintimille on the French Riviera, a district which one would think, because of the very nature of its traffic, would be the first to be electrified. A beginning has been made, but since it has all come into being since the war, at a period when French public and private finance has been at the lowest ebb ever known, it is perhaps not surprising that more has not been accomplished. Speeding up the installation will bring about immense economies, and if the \$40,000,000 which was recently borrowed in the United States be so invested, there is no question but that return on the capital will be more earned.

Another project of this company is the building of an electric line between Avignon and Les Arcs on the main line to Vintimille and the Italian frontier, saving thus some eighty-odd kilometers over the present route. It is bound to come, but since it leaves Marseilles off to one side, 50 miles distant, powerful local interests there are against the project. Such is tradition in France, often a damper, always a hamper, against the adoption of something which in the long run will pay dividends above what might be foreseen by the most optimistic.

Financial and Corporate

Reorganization Planned

\$48,000,000 Cut in Capital Liabilities of New York Railways — Charges and Rentals Cut \$1,720,000

A committee appointed by Judge Mayer of United States Circuit Court at New York has presented a tentative plan for the reorganization of the New York Railways. The proposal as made by the committee contemplates the discharge of the receiver by Jan. 1, 1924, reorganization as a system of properties now operated by the receiver, and formation of a new company to acquire through foreclosure all assets and operating properties of the New York Railways, operating 71 miles of surface lines, mostly in Manhattan Borough. The new company will pay for the properties acquired by the issue of new securities directly to holders of the several issues of bonds of New York Railways, and its predecessor companies, and to creditors of New York Railways in exchange for their bonds and claims. The court has ordered the committee to hold hearings during the week of Oct. 22 and to report back during the week of Oct. 29.

It seemed plain to the committee that the reorganization must provide:

1. For a great decrease in fixed charges.
2. For a great decrease of the total capitalization.

3. For the elimination of all interest of the present stockholders of the company.

Proceeding on this basis the committee for one thing would wipe out entirely the \$17,495,060 of stock previously outstanding. It is proposed that the company's fixed charges be reduced by approximately \$720,000, the annual contingent charges by \$650,000, and the fixed rentals previously paid by the New York Railways upon leased lines by \$350,000. Beyond the cost of operation there will be practically no fixed charges remaining, except the interest to be paid upon a limited amount of underlying bonds that have never been defaulted, and the charges to be paid upon the new capital of \$5,000,000. Returns upon all other security issues in the very much reduced list are to be paid only out of the actual earnings from year to year.

In short, the basic principles recommended by the committee are:

1. The system now operated by the New York Railways should be reorganized substantially as a system as now operated but with greatly reduced capitalization and annual charges.
2. No bonds bearing a fixed annual interest charge whatsoever should be issued by the new company, except for new cash actually contributed to the new company.
3. The only bonds to be left undisturbed should be those of leased lines on which no default has been made and on which the interest has been apparently earned during the receivership.
4. Other obligations now in default and now bearing a fixed charge should be re-

placed by income bonds on which no income will be payable unless actually earned.

5. These income bonds should be offered to the various units composing the system, but limited to the amount of the earnings actually shown to be contributed under present conditions to the system by these various units.

6. Various units which do not receive the principal or par amount of their present obligations in income bonds because the earnings are insufficient should receive the balance due to them in preferred stock of no par value, but no unit should receive more than the principal or par amount of its present existing obligations.

7. No new securities should be issued for arrears of interest or rent which has not actually been earned during the receivership.

8. The existing capital stock of \$17,500,000 par value should be eliminated in the reorganization.

The result is a large reduction in fixed charges and capitalization:

Thus the fixed charge bonds are reduced by \$18,000,000
Income bonds are reduced by .. 13,000,000

Total reduction in obligations..\$31,000,000

The fixed charges are reduced by 720,000
The annual contingent charges are reduced by 650,000
Fixed rentals are eliminated by .. 350,000

COMMON STOCK FOR CASH CONTRIBUTORS

The first mortgage 5 per cent bonds of the Broadway Surface Railroad of 1924 in principal amount of \$1,500,000, and \$350,000 South Ferry Railroad first 5s of 1919 are to remain undisturbed but are to be offered the right of conversion into an equal face amount of Broadway Consolidated mortgage bonds. The plan provides that \$250,000 Central Crosstown Railroad first 6s of 1922 are to be extended but not otherwise disturbed.

To furnish adequate working capital for the company the plan recommends the use of \$5,000,000 prior lien bonds to be issued in reorganization. The cash required must come from the liquidation of non-operative assets which go chiefly to holders of New York Railways first and refunding bonds unless arrangements are made for obtaining additional capital from other sources. The persons contributing the cash, according to the plan, will receive all common stock of new company, together with new prior lien bonds, at such prices as may be determined against cash advanced.

In the interest of closer co-operation of the company and the public, it is proposed that the board of directors shall contain representation of the public named by public authority.

In a statement which he issued commenting on the plan George McNeny, chairman of the New York Transit Commission, said:

Great credit must be given Judge Mayer for the part he has continued to play in bringing these demoralized railway properties back to an orderly condition, and in everything that it has done touching any of the property affected the commission has been able to work in close operation with him. It has been a matter of teamwork throughout, in which the wise and constructive use of the powers of the court by Judge Mayer has been a dominant factor in the progress that has been made.

The members of the committee who signed the report were Bronson Winthrop, Joseph P. Cotton, Charles P. Howland and Henry V. Poor.

Frank D. Pavay, a member of the reorganization committee, will file a

NEW COMPANY CAPITALIZATION

	Principal	Annual Interest
Undisturbed bonds.....	\$15,350,000	\$765,500
New fixed charge bonds, say.....	5,000,000	250,000
New income bonds, say.....	17,500,000	875,000
New Preferred stock, no par.....	120,000 shares*	
Common stock, no par.....	1,000 shares	

COMPARISON WITH FORMER CAPITALIZATION (approximately)

Reduction of face amount of fixed charge bonds (after providing reorganization capital) (approx.)	\$18,000,000
With reduction of an annual fixed charge of (approx.).....	720,000
Reduction of income bonds (approx.).....	13,000,000
With reduction of an annual contingent charge of (approx.).....	650,000
Elimination of fixed rentals (payable on outstanding minority stock interests) per annum of.....	349,066
Elimination of old capital stock.....	17,495,060

* This includes an allotment of .25 of a share of preferred stock for each \$100 face value of general claims against New York Railways. The amount of such general claims is estimated at the present time at about \$5,000,000.

SECURITIES TO REMAIN UNDISTURBED

	Principal	Annual Interest
Broadway and Seventh Ave. 1st Cons. Mortgage 5%, due Dec. 1, 1943.....	\$8,150,000	\$407,500

Sixth Ave. Railroad capital stock, par value.....	2,000,000	

minority report probably in time for the hearing.

Other members of the committee explained the paragraph in their report which read: "Each member of this committee who represents a class of security holders has expressed the view that the plan does not sufficiently protect the interests of his clients," as being merely a formal statement and having no significance.

Abandonment Approved

The Public Service Commission of Pennsylvania has authorized the Pennsylvania-New Jersey Railway to abandon and discontinue its service between Bristol and Doylestown, Pa. The application was made by the company on Feb. 15 last and several hearings were held on the matter. No date has been set for the abandonment.

The property consists of 26 miles of track. The road was built thirty years ago. Gaylord Thompson, general manager, says that the corporation lost \$25,000 during 1922 on that branch. It is believed that buses will replace the railway.

Increased Fare Results in Profit for Seattle

The Seattle Municipal Railway earned a net profit of \$4,655 in August, according to the monthly financial statement sent to the City Council by Superintendent D. W. Henderson. The gross profit was \$74,905 before deduction of a charge of \$70,250 for redemption of bonds. Revenues for the month totaled \$531,134 and operating expenses were \$389,774, with interest charges of \$66,455 in addition. July, the first full month under the restored 8½-cent fare, showed a net profit, due to economies effected, Superintendent Henderson states, but the railway has a deficit accumulated under the 5-cent fare.

August Net in Detroit Low—September Net Estimated at \$45,000

The total revenue of the Detroit Street Railway for the month of August was \$1,754,349, against \$1,606,833 for August, 1922. The total operating expenses were \$1,314,975 against \$1,097,270 for the month of August a year ago. This means that revenue from railway operations was \$439,375 compared with \$509,564 a year ago. The net income for August of this year was \$7,940, a considerable falling off in comparison with August, 1922, when the net income was \$114,801. The total number of passengers carried in August of this year was 41,308,449 and in August, 1922, the passenger traffic was 37,372,148. Due to the increase in fares from 5 cents to 6 cents the net income for the first fifteen days of September showed an increase of \$38,000 over the month of August. It is estimated that the net for the month will be about \$45,000.

Foreclosure Action Started in St. Louis

A foreclosure suit in behalf of the Northern Trust Company, Chicago, trustee for \$1,640,000 of the \$2,000,000 bond issue of the Cass Avenue line of the United Railways, of St. Louis, has been filed in the United States District Court in St. Louis.

The petition asked that the court issue an order making Receiver Rolla Wells a party defendant to the suit. This request was granted by Judge Faris.

This is the second foreclosure action pending against the United Railways since Judge Faris declined to permit Receiver Wells to liquidate outstanding indebtedness against the railway by issuing additional receiver's certificates.

Morton Jourdan filed the suit for the Northern Trust Company. He is also counsel for the North American Company, which controls the common stock and most of the general 4 per cent bonds of the United Railways.

The bondholders' protective committee representing the holders of the United Railways general mortgage has recently authorized its attorneys to notify the trustee under the mortgage, the St. Louis Union Trust Company, to notify the company that the bonds are in default.

The directors of the United Railways at their meeting on Oct. 9 authorized the appointment of a committee representing the various financial interests in the company and probably the public as well to take steps looking to a quick re-financing and re-organization of the property.

The notice to the St. Louis Union Trust Company is the first legal step looking to a foreclosure suit on the entire property of the United Railways.

Preferred Stock Offered in Toledo

In order to promote community interest in the traction lines of the Community Traction Company, Toledo, a block of \$43,140 of the 8 per cent preferred stock of the company, issued under the Milner ordinance to finance new construction work in Spencer Street, has been offered to the public in \$10 shares.

Henry L. Doherty, chairman of the board of the company, has notified President B. C. Adams that in order to complete the work immediately he will take all of the stock, but that he will offer it at par to citizens of Toledo without profit to himself. The stock has been sold over the counter at the traction company office.

Under the ordinance the city has acquired \$476,000 of the common stock of the company issued to it upon retirement of a like amount of the 6 per cent first mortgage bonds through the working of a sinking fund.

Car cards, posters and newspaper advertising have been used to bring the offering to the attention of the public.

It is quite probable that floating debt incurred under the provisions of the ordinance for improvements will be

funded later through additional issues of preferred stock. However, at no time can the securities of the company exceed actual value of the property. Operations of the sinking fund tend to improve the relative position of the preferred stock.

Exchange Offer Announced

An offer to take up the stock of the Tri-City Railway & Light Company and to give in its place stock in the United Light & Railways Company, has been made by the latter corporation, the big holding company which controls the Davenport utilities. This offer holds good until Nov. 1, according to formal announcements which have been mailed all the holders of the Tri-City Railway & Light Company preferred stock. The conversion offer provides for the giving of 6 per cent preferred stock of the United Light in return for the 6 per cent preferred of the Tri-City issue.

The basis of exchange is one share of Tri-City for one share of the United Light and \$8 in cash, or ten shares of Tri-City for eleven shares of United Light. It is stated in the offer that in the first six months of 1923 the dividend of the United Light 6 per cent preferred stock was earned three and a third times. The United Light already owns all the common stock and some bond of the Tri-City.

Seeks to Abandon Lines

The San Diego Electric Railway has applied to the State Railroad Commission for permission to abandon its line from Logan Avenue along Thirty-second Street to the United States destroyer fleet repair base. Stub service is operated on the line to connect with the Logan Avenue cars, and the line is patronized almost exclusively by employees of the repair base. According to Claus Speckels, general manager, the shipping board has failed to keep its agreement dating from the time the line was built in 1918. The shipping board advanced \$46,000 toward construction of the line, which was not to be returned until the shipping board had constructed as many as eight ships at the yards. Only two ships were ever built, consequently Mr. Speckels holds that the shipping board failed to carry out its agreement. The shipping board has made a demand for the return of its money. Mr. Speckels contends that the company cannot operate the line on present patronage if the shipping board's money is to be returned, and hence he has asked for permission to abandon service. Manager Speckels says he offered to rebuild the line if the shipping board would permit the company to keep the money advanced, but the offer was rejected. The line is about one-half mile, single track.

Buys Interest.—A controlling interest in the Wapsie Power Company has been purchased by the Iowa Railway & Light Company. The Wapsie company's headquarters are at Mount Vernon.

Trustees of Eastern Massachusetts Company Say Dividends Unwarranted

The Eastern Massachusetts Street Railway and its trustees, Boston, Mass., have filed their answer to the suit brought by L. Sherman Adams and others to compel a larger disbursement of dividends on adjustment shares. It is denied that any dividends have been wrongfully withheld or that any had accrued in February, 1923. On the other hand, it is asserted that no dividends on any class of stock were to be paid unless fully earned and that the financial condition of the company does not warrant the payment of additional dividends.

The trustees claim that when control of the company passed to them in January, 1919, the property had been operated for a year and a half by receivers at a loss of \$1,295,291 and they were obliged by a decision of the War Labor Board to pay additional wages aggregating \$941,733 annually. A 10-cent fare was established and every economy practiced. In spite of this the company failed to earn the cost of service in 1919 by \$589,920. During 1919 and 1920 124.1 miles of line were discontinued as non-paying, but owing to higher operating costs and another wage advance another deficit resulted. In 1921 conditions improved, but at the end of that year arrearage of unpaid accumulated dividends and sinking funds, aggregating \$2,633,457 on Feb. 1, 1922, could not be met except through a financial readjustment which was finally effected.

The trustees have felt that the earnings and the financial condition do not warrant payment of any dividends other than those that have been paid, particularly in view of the fact that wages were again advanced, effective May 1, 1923.

Robert R. Landis Appointed Receiver of Ohio Property

Following a conference of attorneys representing both sides in the foreclosure and receivership suit of the First Wisconsin Trust Company, Milwaukee, against the Dayton, Springfield & Xenia Southern Railway, with United States District Judge Smith Hickenlooper at Cincinnati on Oct. 13, Robert R. Landis, Dayton attorney, was named by Judge Hickenlooper as receiver of the traction company's assets with directions to continue operations of the system in and out of Dayton.

Judge Hickenlooper fixed Mr. Landis' bond at \$30,000, which was given simultaneously with his appointment. Mr. Landis was named by the court as a result of the failure of the parties to the action to agree upon a person to be appointed receiver. The complainant desired the appointment of A. H. Elfner, former general manager of the Cincinnati, Georgetown & Portsmouth Railway, while the defendant sought the appointment of A. L. Ferneding, of Dayton, present general manager of the defendant company.

The bill of complaint of the First Wisconsin Trust Company was filed in the Federal Court at Dayton Oct. 2. In the suit, it was alleged that the traction company had defaulted interest due on outstanding bonds, of a bond issue of \$500,000 secured by mortgage to the trust company. The matter was referred to in the *ELECTRIC RAILWAY JOURNAL*, issue of Oct. 13.

Valuation Hearing at Minneapolis Under Way

The valuation hearing of the Twin City Rapid Transit Company, operating in Minneapolis and St. Paul, has started before the Railroad & Warehouse Commission. A. M. Robertson, the first witness on Oct. 10, did not reveal the amounts to be claimed as investments. More than a year ago the commission authorized an increase from the 6-cent fare to a 7-cent fare, but this was held up by court injunction.

Master Recommends Pittsburgh Receivership Be Lifted

The final report of Special Master Henry G. Wasson in the Pittsburgh Railways case has been filed with the United States District Court. Mr. Wasson recommends the termination of the receivership of the railway, which has been in receiver's hands for the last five and a half years. Should the court approve the report, as expected, the company will pass out of the receiver's hands by Jan. 1, 1924.

Application to lift the receivership was made on Feb. 15, 1923, by President A. W. Thompson of the Philadelphia Company, which controls it. The city of Pittsburgh had joined with the company in a reorganization plan, the joint agreement including the creation of a traction conference board composed of company officials, members of the City Council and representative from each of the municipalities served by the railway.

No reduction in rate of fare from the present fare of three tokens for a quarter is probable, as the master's report states this fare is necessary if the road is to continue operations on an equitable basis.

As has been detailed previously in the *ELECTRIC RAILWAY JOURNAL* the capitalization under the reorganization plan was scaled down from \$156,290,750 to \$62,500,000 and under agreement with the city, the company will be entitled to receive a net return after charges and depreciation of \$3,750,000 annually.

Twelfth Annual Report Submitted

According to the twelfth annual report of the Toronto Hydro-electric System, the gross income for the year ended Dec. 31, 1922, was \$4,404,754. The cost of electric current and expense of operation and management, including repairs and maintenance, was \$3,053,110. After consideration of the interest, depreciation, exchange, taxes, etc., the excess of income over expenditure at existing rates amounted to \$232,041.

Temporary Injunction Against Chicago Sale

A temporary injunction was issued on Oct. 9 restraining the Illinois Merchants Trust Company from selling \$14,000,000 securities of the Chicago Elevated Lines. The petition for the injunction against the sale was filed by preferred stockholders of the elevated lines through their attorney. They charge that the sale of these securities is part of a conspiracy.

Attorney Frank H. McCullough, representing the Illinois Merchants Trust Company, opposed granting of the injunction. He said no interest has been paid on the \$14,000,000 gold notes held by his clients since 1919 and said the noteholders were entitled to their interest at least. Therefore, collateral security notes should be sold.

The restraining order was granted by Circuit Judge Hugo M. Friend. The court in granting this restraining order said:

In view of the allegations of the complainants in which they charge that the trustees had caused the default in interest payments by making unauthorized loans and had otherwise diverted funds of the trust without authority, it is necessary, in the absence of denials, to issue the injunction.

If the sale, scheduled to be held on Oct. 15, is consummated the complainants in this suit will be powerless to recover any losses they may consequently have sustained. On the other hand, this sale has been delayed since 1919, when the first interest payments were defaulted, and further delay can work no injustice on the gold note holders.

Judge Friend advised Attorney Henry S. Robbins, representing the holders of the gold notes, to file an immediate answer to the bill. If the gold note holders can make positive denials of the bill's charges and support them with competent evidence, the injunction would be dissolved, he said.

Sale of \$2,496,557 of Bonds Authorized

The Public Utilities Commission of the District of Columbia has authorized the Washington Railway & Electric Company to:

1. Place a general mortgage of \$10,000,000 on its property, subject to prior liens.
2. Issue and sell \$2,496,557, face value, of its general and refunding 6 per cent ten-year gold bonds secured by the general mortgage.
3. Issue and pledge with the United States Housing Corporation \$150,000, face value, of its general and refunding mortgage 6 per cent ten-year gold bonds dated Nov. 1, 1923, in lieu of a like amount of its general mortgage 6 per cent five-year gold bonds, the latter bonds to be retired and cancelled.

The issue and sale of the bonds were authorized upon the conditions that follow:

1. That the company sell the bonds at the highest obtainable price.
2. That all discounts, commissions and expenses in connection with the approval and issuance of the bonds be amortized out of the income of the company during the life of the bonds.
3. That the general mortgage 6 per cent five-year gold bonds due Dec. 1, 1923, be paid off, retired and cancelled.
4. That the company show the receipt and application in detail of the proceeds of the sale of the bonds and on or before the fifteenth day of January and the fifteenth day of July make verified reports to the commission until the bonds shall have been sold and all of the proceeds expended.

West End May Suspend

The West End Traction Company, a subsidiary of the Pennsylvania-Ohio Electric Company, has filed a petition with the Ohio Public Utilities Commission asking permission to abandon its service. The hearing has been set for Nov. 16 at Columbus.

The West End Traction Company operates 24 miles of track. The principal route is a 15-mile interurban line connecting Youngstown and Girard, Niles and Warren. In addition there are short suburban lines from Niles to Mineral Ridge and from Warren to Leavittsburg. There are also approximately 5 miles of city track operated in Warren. All the trackage is in Trumbull County, Ohio.

In its petition the West End Company points out that in meeting operating costs, including taxes, it sustained the following losses: \$108,845 in 1920, \$129,602 in 1921, \$71,449 in 1922 and \$31,829 in the first seven months of 1923, or a total of \$341,725 for the period. Without material relief in the form of increased rates, it is pointed out there is no hope of operating, excepting at continued heavy losses.

Receiver Appointed in Owensboro

W. A. Carson of Evansville, Ind., has been appointed receiver for the Owensboro City Railroad, Owensboro, Ky., by Federal Judge Walter Evans of Louisville. The action was taken on a petition of the American Savings Bank & Trust Company, trustee for the bondholders, against the company, seeking to foreclose a mortgage securing \$200,000 of bonds. It was set forth in the petition that 71 per cent of the bondholders joined in the petition for the appointment of a receiver.

The system will continue to be operated under Receiver Carson until a decree of some kind is entered in federal court. The system will probably be ordered sold. The bonded indebtedness is \$400,000, half being first mortgage bonds and half second mortgage bonds. The company has been unable to pay the interest on the bonds for the last six years, the money intended for the bondholders going for the upkeep of the system.

Court Rejects Plea

Supreme Court Justice Irving Lehman on Oct. 13 declined to give judgment on the pleadings to Stephen and Nina H. Peabody, Manhattan Railway stockholders, in a suit against the Interborough Rapid Transit Company, New York, to compel the payment of 7 per cent per annum dividends to Manhattan stockholders, under the 999 years' lease of the Manhattan's elevated lines to the Interborough.

The Peabodys began suit in 1921, when the 7 per cent payments were discontinued and proceedings instituted to arrange for a lower rate of dividends. The plaintiffs asserted that the defendant company had guaranteed the payment of 7 per cent on Manhattan stock.

Justice Lehman holds that the Interborough's agreement was with the Manhattan Railway and not with its individual stockholders; that the 7 per cent was to be paid as rent; that the amount of rent to be paid may be changed, by agreement between the two companies, under changing conditions, and that the promise to pay 7 per cent "could not survive a valid revocation or modification of the lease by the parties to the lease."

The scaling down of the Manhattan dividend payments was one of the considerations agreed upon by the great bulk of the stockholders of that company as part of the recent readjustment of Interborough finances.

Auction Sales in New York.—At the public auction rooms in New York on Oct. 17 there were sold \$1,000 of Southern Indiana Gas & Electric Company 6 per cent bonds, due 1947; 90 per cent.

Will Redeem Notes.—All of the outstanding \$3,600,000 five-year 7 per cent secured gold notes of the Milwaukee Electric & Light Company, known as series A-1, will be redeemed Oct. 31, 1923, at par and interest. The bonds are due Nov. 1, 1923.

Financing of Electrification Arranged.—The Illinois Central Railroad has applied to the Interstate Commerce Commission for authority to issue and sell \$12,022,450 of 6 per cent preferred stock, the proceeds to be used for the electrification of the company's lines within the city of Chicago. It also asked permission to issue a like amount of common which is to be issued from time to time in exchange for and retirement of the preferred, share for share.

Wants Property Auctioned.—An order was entered in Circuit Court on Oct. 12 directing the master commissioner to offer for sale at auction the property of the Henderson Traction Company on Oct. 29. The city of Henderson was awarded a judgment of \$4,548.35 with 6 per cent interest from July 28 last which is a prior lien on the property for street oiling tax. The railway ceased operation July 15, when it defaulted payment of interest.

Highest Net Since 1913.—The returns of the United Railways, St. Louis, during the year ended July 31, 1923, exceeded the earnings for each calendar year from 1913 to 1922, according to figures just issued by Receiver Rollo Wells. The gross earnings for the year totaled \$20,648,831, and after expenses and depreciation charges had been paid the net income for the period was \$3,720,133. The previous high record was established in 1920, when the income was \$3,701,442.

Requests Deposits.—The bondholders' protective committee for the first mortgage sinking fund gold 5s. of the Waterloo, Cedar Falls & Northern Railway has announced that it has decided to limit the time for the deposit with the committee of further bonds under the bondholders' agreement of Nov. 15, 1922 to Nov. 1, 1923. After this date no additional bonds may be deposited

under the protective agreement except at the discretion of the committee.

Another Hearing on Carhouse Sale.—Adjourned hearing of the argument on the application of the Broadway & Seventh Avenue Railway, New York, to cancel a lease held by the New York Railways on the carhouse block, Broadway, Sixth Avenue, Fiftieth and Fifty-first Streets, will be held on Oct. 22 in the Federal District Court. This is preliminary to the sale of the block for \$5,000,000, to a syndicate headed by Tex Rickard, which plans to build an athletic sports' center.

Hearing on Allocation Case Oct. 27.—Hearings on the suit of the city against Detroit United Railway over the proper allocation of the Detroit United Railway's consolidated mortgage to lines purchased by the city have been postponed to Oct. 27, at which time briefs will be submitted. The lines acquired by the city for \$19,000,000 are covered by a consolidated mortgage of \$25,000,000 given by the Detroit United Railway on its interurban lines and its former city lines now owned by the city of Detroit.

Earnings Behind in Youngstown in August.—According to an announcement by Street Railway Commissioner Engel, the revenue from the combined railway and bus lines of Youngstown, during the month of August, failed by \$17,853 to pay the cost of operation. This sum will be added to the previous deficit of more than \$1,000,000. Mr. Engel's statement says that the earnings were \$136,124, and the cost of operating \$154,738. The total number of car miles furnished in August was 416,847. The service cost per car mile was 37.15 cents. The cost per car-hour was \$3.23.

Fails to Pay Cost of Service in August.—During August the Boston Elevated Railway failed to pay for the cost of service by \$319,516. The deficit was larger in August this year than it was in August, 1922, when the road went behind \$217,128. The total number of revenue passengers during the month was 28,086,112, against 26,877,682 in August a year ago. The percentage of passengers paying a 5-cent fare to the total number paying had increased in the year from 22.33 per cent to 25.50 per cent. The average rate of fare was reduced from 8.883 cents in August, 1922 to 8.713 cents in August, 1923.

Offer Made for Exchange of Tri-City Shares.—The stockholders of the Tri-City Railway & Light Company, Davenport, Iowa., a subsidiary of the United Light & Railways, Grand Rapids, Mich., have received an offer from the latter company to exchange the 6 per cent first preferred stock of United Light & Railways, for the 6 per cent preferred of the Tri-City Railway & Light Company on the following basis: Each ten shares par value \$100 of the 6 per cent preferred of the Tri-City may be exchanged for eleven shares (par value \$100) of the United Light & Railways 6 per cent preferred. The offer is good until Nov. 1.

Traffic and Transportation

Decrease in Fare Opposed

President Ham of Washington Railway & Electric Company Says Fair Return Is Not Being Earned

Opposing the request of the Federation of Citizens' Associations that the District of Columbia Public Utilities Commission order the railways of Washington to sell three tokens for 20 cents, William F. Ham, president of the Washington Railway & Electric Company, testified before the commission on Oct. 15 that he estimated such an order would cost that company \$104,207 loss of revenue per annum. Mr. Ham also declared that compliance with the order would slow the service, as it would increase the number of token sales conductors would be obliged to make.

The fare in Washington is 8 cents, cash, with six tokens for 40 cents. The Citizens' Federation petitioned for three tokens for 20 cents, on the ground that many passengers did not find it convenient to buy six tokens at a time and hence were forced into paying the cash fare of 8 cents. At the hearing on Oct. 15, William McK. Clayton, attorney for the Federation, suggested that if the commission did not consider it wise to order three tokens for 20 cents, the cash fare should be reduced to 7 cents.

Figures were presented by President Ham to show that of the present pay passengers carried by the Washington Railway & Electric Company, 20.33 per cent rode on cash fares and 79.67 on tokens. He estimated that if the suggested plan of selling three tokens for 20 cents were adopted only 10 per cent of the present passengers would pay the 8-cent cash fare in the future, thus bringing the \$104,207 annual loss to the company. He expressed the opinion that most cash fares are paid by visitors in Washington, or casual riders, and that no benefit would accrue to the regular passengers.

Statements were introduced by Mr. Ham showing that in the twelve months ended Aug. 31, last, the gross revenues from operations within the District of Columbia were \$5,576,995, a decrease of \$77,609 compared with the preceding twelve months. During this period, operating expenses, taxes, etc., were \$4,825,824, an increase of \$37,955. This left \$751,170 available for return upon investment for the year ended Aug. 31, 1923, or a decrease of \$115,564 compared with the previous twelve months.

Mr. Ham showed that the fair value of the properties, as fixed by the commission, is \$17,871,366, making the present return upon the investment 4.2, compared with 4.94 for the preceding year.

Statements also were introduced by Mr. Ham showing that during the same

periods, the operating revenues of the Washington Railway & Electric Company and the Capital Traction Company, combined, had decreased \$305,375 and that the operating expenses, combined, had increased \$61,835, making a decrease in operating income of both companies of \$367,210.

From these statements, Mr. Ham computed that during the year ended Aug. 31, 1923, the Washington Railway & Electric Company earned only 4.2 per cent upon its fair value as fixed by the commission, while the Capital Traction Company had earned 7.66 per cent upon its valuation, and both companies combined had earned 5.87 per cent upon their joint fair value. The Washington company had failed by \$499,824 to earn a 7 per cent return and the Capital Traction Company earned \$109,769 more than a 7 per cent return, his statement showed, while both companies combined had earned \$390,054 less than a 7 per cent return.

Mr. Ham further showed that traffic in the District of Columbia has fallen continuously since 1919, the peak year. In 1919, he testified, both companies had carried 166,113,350 pay passengers, whereas during the year ended Sept. 30, 1923, the combined traffic of both companies had fallen to 143,398,130, a loss of 22,715,220 passengers, of which about one-third had been sustained by his company and two-thirds by the Capital Traction Company. This tendency was not abating, he said.

Trackless Trolleys Start in Philadelphia

Philadelphia had its first experience with trackless trolleys on Oct. 14 when the first vehicle of this type of transportation traversed Oregon Avenue and east to its terminus at the Tidewater Docks at Delaware Avenue. In the car were J. W. Hall, superintendent of instruction; instructor John Holland, division superintendent Worlin and assistant superintendent Van Horn of the Sixteenth and Jackson Streets carhouse. It took exactly thirty-five minutes for the car to arrive at its starting point.

This line of trackless trolleys is run over Oregon Avenue in order that service may be promptly supplied to the 2,000 men now employed at the Tidewater Docks, and to the growing population south of Snyder Avenue, who would otherwise be without car service for some considerable time to come.

The company has announced through Thomas E. Mitten, chairman of the executive committee, that just as soon as the trackless trolley operation on this route has passed its experimental stage the company will be glad to consider the advisability of extending the service westerly over Passyunk Avenue and Sixty-third Street to Woodland Avenue.

Will Advance Shreveport Fare Case

The United States Supreme Court on Oct. 15 granted the motion of the Louisiana Public Service Commission to advance argument on its appeal from the ruling of the District Court in granting an interlocutory injunction to the Shreveport Railways restraining the commission from interfering with collection of a 7-cent fare in Shreveport, La. The case was set for Jan. 7.

It is three years since the fare controversy started in Shreveport. In 1920 by a vote of the people, the railway company was allowed an increase from 5 cents to 6 cents. The election was contested by Huey P. Long, chairman of the Louisiana Railway Commission, acting as a citizen of Shreveport. The State Supreme Court upheld it. In 1921 when the state Constitutional Convention changed the name of the railway commission to the Public Service Commission it gave the Public Service Commission authority to fix rates. In April, 1922, the commission issued an order without a hearing, fixing the car fare in Shreveport at 5 cents.

After an appraisal of the property had been made by valuation engineers, the Public Service Commission granted a hearing on the application of the company for an increase in fare at which evidence was submitted on both sides on the question, but the commission failed to make a decision. The company then appealed to the United States District Court and secured a temporary injunction against the commission restraining that body from interfering with the company's collecting a 7-cent fare. Huey P. Long, chairman of the commission, then sought and was granted an appeal to the United States Supreme Court. He based his appeal on the plea that the Federal District Court was without jurisdiction.

Ban Put on One-Man Cars in Oakland

An ordinance was passed to print on Oct. 8 by the City Council of Oakland, Cal., which prohibits the operation of one-man cars in the city. The Council adopted the measure without comment, the ordinance to become effective within eight days. The action by the Council was initiated by Mayor Davie. In urging that body to legislate on the matter the Mayor said in part:

The San Francisco-Oakland Terminal Railway has recently placed in service a new type of car, capable of accommodating more than forty passengers, which is so constructed that it may be operated by a crew of two men or as a one-man car. I do not believe that the company should be permitted to operate these new large cars with only one man in charge in the downtown traffic. I feel that public safety and welfare demand that street cars be in charge of two men if they are to be operated through those sections of the city where there is a heavy volume of general traffic.

This company is still charging our people war-time rates for transportation, at the same time endeavoring to reduce the car operating personnel at the expense of public safety.

Crosstown Bus Service to Be Started by Utah Light & Traction

The Public Utilities Commission of Utah has granted permission for the Utah Light & Traction Company to operate a crosstown bus line to connect with its street car line at State and Thirty-third South Streets and to run east to the community known as East Mill Creek. The bus fare has been fixed at 10 cents and special rates for school children are to be put into effect.

The matter came before the commission originally on the petition of the Blue & Gray Bus Line, which proposed to continue the service from East Mill Creek to reach the business center of Salt Lake City, in competition with the traction company. To that petition the railway protested, and finally introduced a petition in intervention, asking the privilege of starting, in place of the proposed service to Second South Street, a "feeder" service which would connect with its lines on the Holliday and Nibley Park routes and on the several routes running south on State Street.

The Blue & Gray Bus Line did not care, it was set forth, to operate buses as feeders to the traction company's lines without giving also the through service to the business center.

In rendering its decision the commission stated that a certain sum of money is necessary to carry on the street railway business, which money must be collected in the form of fares from the traveling public. It said that to deplete the revenues of the railway by authorizing a competitive bus service would only restrict still further the company's ability to give service, and, if the competition were carried to its logical conclusion, would utterly destroy the service so necessary to many. The necessities of the general traveling public must be considered, rather than the convenience of the few.

Trackless Trolley Ready in Rochester

The Rochester Railways Coordinated Bus Lines, Inc., a subsidiary of the New York State Railways, awaits only the sanction of the State Public Service Commission to begin the operation of trolley buses over a crosstown route through the northeast end of Rochester, N. Y. Two of the trackless cars have already been received and the other three are in transit, according to officials of the railways.

The state commission held a public hearing on the application of the company for permission to operate the line in Rochester on Oct. 15. The decision of the commission is expected at an early date. Poles and wire have been strung and all is in readiness for the new line, which is regarded as a decided step forward in Rochester transportation facilities.

The trolley buses will operate over Driving Park Avenue bridge and will serve a fast growing industrial and residential district.

Auxiliary motor bus service will be operated from the end of the Dewey Avenue car line to Latta road, in Greece. This line will begin operations on the arrival of equipment, which is expected within a few days.

Weekly Ticket in Effect.—The Wisconsin Traction, Light, Heat & Power Company, put into effect on Oct. 1, a weekly ticket plan.

Petition Tabled.—The City Council of Youngstown has laid on the table the request of the Pennsylvania-Ohio Electric Company to establish an additional rate of fare on the Youngstown Municipal Railway lines.

Will Operate One-Man Cars.—The Milford & Uxbridge Street Railway, Milford, Mass., is preparing to put one-man cars in operation by Nov. 1, on the Grafton and Upton electrified line. It will be the first time that one-man car service has been operated on any of the lines of the company.

Will Apply for Bus License.—James F. Jackson, chairman of the board of trustees of the Boston Elevated Railway, has notified those interested in car service on Hanover Street, recently discontinued, that the trustees will apply to the City Council for a license to operate buses to and from Haymarket Square as a substitute for the former service.

Commission Approves Fare Plan.—Final approval has been given by the Wisconsin Railroad Commission to the agreement recently reached by Superior City officials and the Duluth Street Railway. The plan referred to in the *ELECTRIC RAILWAY JOURNAL*, issue of Sept. 15, provides for a 10-cent cash fare in Superior with five tickets for 30 cents.

Weekly Edition Appears.—The Spokane United Railways, besides publishing its regular edition of "Trolley Topics," has introduced a supplement, published weekly, which is now appearing in the Spokane daily newspapers every Thursday. The supplement will report news regarding operation of the Spokane United Railways as well as important developments in the street railway industry of the country.

Jitneys Allowed.—The new ordinance at El Paso, Tex., barring buses and motor vehicles carrying passengers for hire from certain streets has been held void by Judge Stewart Berkshire of the Corporation Court. Approximately forty jitneys that had stopped operation when the ordinance was first enacted immediately resumed operations.

Joint Five-Cent Fare and Transfer Confiscatory.—Federal Judge John C. Knox, at New York has confirmed conclusions of former Judge E. Henry Lacombe that a joint 5-cent fare and transfer on the Belt Line Railway, New York, would be confiscatory. Judge Lacombe rendered his decision in 1912 against the former Public Service Commission. A temporary injunction was obtained by the Belt Line Railway Corporation and that has held until now,

and will by this decision be made permanent.

School Tickets on Sale.—The Northport Traction Company, Northport, N. Y., now has on sale tickets in strips of ten for 50 cents, each ticket having the face value of 8 cents, for the transportation of children of five years of age and under sixteen years who are regularly attending public or private schools. The tickets are good on school-days only and between the hours of 8 a.m. and 5 p.m. This new order approved by the commission became effective Oct. 10.

San Diego Merchants Give Weekly Pass as Premium.—From voluntary mention in their advertisements that patrons should shop often with no extra cost via weekly pass, several San Diego merchants have gone a step further. A half-page advertisement of "The White House" in the *San Diego Union* for Sept. 23 announces the first of a series of Monday weekly pass special events. With every \$10 purchase on Monday, the concern will give a dollar pass to San Diego city customers or a \$1.25 pass to Coronado customers.

Eight-Cent Fare Suspended.—The Public Service Commission has suspended the 8-cent fare which the International Railway, Buffalo, had planned to put into effect on the local lines on Oct. 8. The fare has been suspended for a period of four months or at least until the determination of the rate case now being held before the commission. The International has not presented all of its evidence in the rate case and the municipal authorities have presented practically no proof in the proceeding. The appeal of the city from decisions of the Public Service Commission authorizing the company to charge a fare higher than 5 cents will be argued by George Clinton, special counsel for the city, before the United States Supreme Court at Washington sometime before next February.

Jitney-Car Situation Acute.—On orders of Safety Director Hamilton all jitneys were ousted from Central Square in Youngstown on Sept. 26. A still further development in the story of the jitneys in that city was the passing by the Council of a new ordinance shoving the jitneys further away from Central Square and their established parking places. The ordinance was prepared by Street Railway Commissioner Engle. At the same time the Council tabled indefinitely an ordinance fathered by Ross Raymond, head of the jitney men, which would have permitted the jitneys to park in their regular place in Central Square. The Council, also tabled the ordinance giving the safety director full jurisdiction over traffic regulations in the congested district. It is understood with the new restrictions in force that a well-defined plan is under way to bring the jitney-car controversy before the citizens at a special election. The new ordinance is an attempt by the Council to correct provisions in a previous ordinance held by the court to be worthless.

Personal Items

George Le Boutillier, President of the Long Island

George Le Boutillier has been named president of the Long Island Railroad to fill the vacancy caused by the death of Ralph Peters. It was on Jan. 18 of this year at a meeting of the board of directors that Mr. Le Boutillier was elected an additional vice-president to assist the president in the general control of affairs of the company, and in the absence or disability of the president to exercise and perform all the powers belonging to the latter. Mr. Le Boutillier is only forty-eight years old. He has consecutively held the positions of assistant engineer, division engineer, engineer maintenance of way, division superintendent and general superintendent of the Pennsylvania Railroad, which he served in various capacities for twenty-seven years. He was general superintendent of that company at Harrisburg up quite recently.

Col. W. J. Wilgus and Prof. Burr Consultants to the New York Transit Commission

Col. William J. Wilgus and Prof. William H. Burr have been appointed consulting engineers by the New York Transit Commission to assist and advise the commission's technical staff upon the many engineering problems which will come up in the building of the new lines. Messrs Wilgus and Burr will begin at once a study of the basic plans made by the commission's engineers, and will hereafter work with them in developing the details and deciding upon methods of construction.

Both men are prominent in the engineering world. Colonel Wilgus was formerly chief engineer of the New York Central Railroad, and had charge of the enlargement of terminals, including the now Grand Central Station, and also the change of motive power from steam to electricity. During the war Colonel Wilgus served as deputy director of general transportation of the American Expeditionary Forces in France, with the rank of Colonel in the Army. He did very brilliant work in this connection and was awarded the D.S.M. and made an officer of the Legion of Honor.

Professor Burr has for many years held a leading place among the civil engineers of America. He was consulting engineer for the city of New York in the building of docks and the construction of the new water system. By appointment of President McKinley, he served as a member of the Isthmian Canal Commission to report upon the most feasible route for an inter-oceanic canal, and was reappointed by President Roosevelt. Under Governor Dix, he was appointed a member of the Advisory Board of Engineers for the construction

of the New York State Barge Canal. In 1900 he was awarded first place in the national competition for the proposed memorial bridge across the Potomac River at Washington. For several years he was professor of civil engineering at Harvard and Columbia Universities.

Mr. Kressler in Saginaw

New Head of Saginaw Properties Sounds Public Attitude Before Entering Upon His Duties

Charles S. Kressler, president and general manager of the Saginaw Transit Company, which will operate street cars and buses in Saginaw under a franchise granted on June 25, has had twenty-five years' experience in public

C. S. Kressler

utility operation. He started with the Detroit United Railway in the power and overhead departments, where he was employed for more than ten years. Mr. Kressler next became connected with the Allis-Chalmers Company, but in 1909, when Alex J. Groesbeck, now Michigan's Governor, and his associates had control of the Saginaw & Flint interurban, he was superintendent of power and overhead. Later when the Michigan Railroad took over the property Mr. Kressler continued with the line as superintendent of overhead.

On Oct. 1, 1913, he went to Manistee as general manager of the electric, gas and street car lines that later were taken over by the Consumers Power Company. Two years ago, however, the railway service there was withdrawn because of the constant loss in revenue. Mr. Kressler remained with the properties at Manistee until the recent organization of Saginaw Transit Company. He was elected president and general manager of the company and is in complete control.

Mr. Kressler knows that he is facing a tough job in Saginaw. Street cars

have not been operated there since Aug. 11, 1921, and while the public have come in the meantime to a keen realization of the value of the railway, it is only human to expect that they will be inclined to be critical of the little things. Fully realizing this Mr. Kressler acted accordingly on taking up his duties. He did not fight shy of the local journalists, but he did put them off for a few days on their requests for a portrait of him. This was all part of the man's plan for learning things for himself at first hand, for before his picture appeared in the local press Mr. Kressler traveled over the city incognito visiting all sections to learn at first hand the reaction of the public to the incoming railway administration and to gain some knowledge of where, in the opinion of the public, the previous railway administration had been guilty of either sins of omission or of commission that had worked against it with the public.

Just as soon as he had completed this personal survey Mr. Kressler released his portrait for publication. In not a few instances it was at once recognized by many as that of the man who had interviewed them on one phase or another of the local transportation problem, but nowhere was there any evidence of resentment over the fact that Mr. Kressler had not previously disclosed his identity.

Mr. Kressler says: "You must sell yourself and service to the public. Since I have been in Saginaw I have been studying conditions and I believe I know first hand what the people want and I am going to give them what they want if it is possible to do so."

Fred E. Mathews has replaced J. L. Hale as chief dispatcher of the Winona Interurban Railway, Warsaw, Ind. Mr. Hale's unfortunate death was referred to in the *ELECTRIC RAILWAY JOURNAL* of Sept. 15, 1923.

E. A. Aspnes, president, general manager and purchasing agent of the Wau-paca Electric Service Company, has severed his connections with that company. James Richardson has been appointed in the capacity of vice-president and general manager.

William M. Quackenbush, general superintendent of the Rapid Railway System, Port Huron, Mich., has resigned after twenty-seven years with the system. He started in a minor capacity and rose through intervening posts until he became superintendent twelve years ago.

Paul Shoup, vice-president of the Southern Pacific Company; president of the Pacific Electric Railway, Los Angeles, and an officer in many other companies under Southern Pacific control, has been made a director of the Anglo & London-Paris National Bank, San Francisco.

Clark R. Jackson, former State Tax Commissioner, has been appointed by Mayor E. J. Brown superintendent of Public Utilities of Seattle, Wash. The appointment has been approved by the City Council. Mayor Brown states that

he expects the new superintendent, aside from running his own department, to make a survey of the light, railway and water departments looking toward a valuation of the properties.

James Dalrymple, general manager Glasgow Corporation Tramways, who has been in this country on an extended visit, planned to return on Oct. 20. After attending the Atlantic City convention Mr. Dalrymple spent the last week of his visit in New York. Just before leaving he said that the electric railways as a whole have made great advances since he had visited America in 1913 and that he had found much to interest him on his trip.

Enrich G. Elg has resigned from the Chicago Surface Lines to become office and sales engineer on copperweld wire and other products of the Copper Clad Steel Company for the Steel Sales Corporation, Chicago. While with the Chicago Surface Lines, Mr. Elg had charge of tests in the shops and equipment division and was associated in new car construction. Previous to this, he was operating engineer of the Decatur Railway & Light Company, an Illinois Traction property. Mr. Elg is a graduate of the school of electrical engineering, University of Illinois.

Alvin Coffman, formerly claim agent of the Chicago & West Towns Railway, Oak Park, Ill., resigned this position on Sept. 15. Mr. Coffman became identified with electric railway work in Roanoke, Va., where he served as superintendent of transportation and claims agent for a number of years of the Roanoke Railway & Electric Company. Later he conducted a joint claim adjusting bureau in Dayton for the City Railway, the People's Railway and the Oakwood Street Railway. It was from the service of these companies in Dayton that he resigned to engage in war work. He is a native of Philadelphia.

Obituary

Benjamin B. Foss, retired superintendent of the Lynn division of the Eastern Massachusetts Street Railway, died recently at his home in Lynn. He was born in East Parsonfield, Me., fifty-eight years ago. He entered into the employ of the Boston & Lynn Street Railway as a motorman in the year 1898.

William L. Cosgrove, Atlanta, for many years prominently identified with the Georgia Railway & Power Company as an engineer, and at one time president of the Atlanta Gas Light Company, a subsidiary organization of the power company, died Oct. 8 in a hospital at Kent, England, according to cable information received in Atlanta. Mr. Cosgrove, with his wife, had been traveling in Europe for the past two years, and about a month prior to his death he was stricken with apoplexy. He was sixty-four years of age. He retired from active business life about five years ago.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions
A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

Japan Will Spend Several Million Dollars for Electrical Equipment

Although it is impossible at the present time to obtain complete information concerning the extent of the destruction of electric railway property in Japan, nevertheless from inquiries received by manufacturers in the United States it is evident that much material will be needed to restore them to their former operating efficiency. Inquiries have been received for about 300 trucks and underframes for single-truck cars. It has been the practice in the past for Japan to import trucks and motors largely from the United States and to build the car bodies locally in Japan. This method will presumably be followed in replacing the cars destroyed by the recent disaster. Inquiries for upward of 500 electric motors for railway service have also been received. These, together with the trucks already mentioned, will constitute the essential equipment for several hundred cars. It is thought, however, that the total number destroyed will be found larger than that and apparently this is only the first step in the program of restoration.

The Westinghouse Electric International Company has already received orders for electrical apparatus to be used in reconstruction work in Japan totaling more than \$1,000,000. Other orders in course of negotiation will bring the total amount to approximately \$2,000,000. According to the latest information the power plants in the earthquake zone were not seriously damaged, but the distribution systems were practically destroyed.

fied with the work done in the past by welding school graduates. At the same time the application for the welding processes has been extended to so many new fields that the demand for skilled operators is constantly increasing. It is thought therefore that by making a thorough investigation of the needs of the industry and then making recommendations to welding school instructors, the instruction programs can be revised and standardized so as to more fully meet the requirements of the employers.

Steel Prices Are Steady

According to information recently published by the Department of Commerce there has been little change in the price of iron and steel during the past three months. The present figures are somewhat higher than in the latter part of 1921 and in 1922, but far below those of 1919 and 1920. The weekly average price of iron and steel composite for the past five years was as follows:

	Per Ton

Improvement Noted in G. E. Orders

The General Electric Company received orders amounting to \$65,483,549 during the quarter ended Sept. 30, according to a recent announcement of the company. This compares with \$58,914,620 in the corresponding three months of 1922. Orders for the first nine months of this year were \$229,747,304, compared with \$176,171,194 in the same period of 1922.

Gas Manufacturers to Co-operate with Welding Schools

The Gas Products Association, whose headquarters are at 140 South Dearborn Street, Chicago, Ill., recently appointed an educational committee to co-operate with trade and technical schools in supplying a practical and standard course in welding procedure. Many users of oxyacetylene welding equipment have not been entirely satis-

Rolling Stock

Princeton Power Company, Princeton, W. Va., has purchased four all-steel cars.

Detroit United Railway has ordered from the St. Louis Car Company ten all steel passenger interurban cars. The cars are of the same type as the ten ordered by the Indiana Service Corporation.

Tygarts Valley Traction Company, Grafton, W. Va., will receive two cars from J. G. Brill Company of Philadelphia. The secretary of state of West Virginia authorized the leasing of the cars to the company for an initial payment of \$3,245 and the payment of three like sums within the next ninety days.

Illinois Power & Light Corporation, Chicago, Ill., has completed plans for building six new 80 ton, all steel, electric locomotives, 1,000 hp. each, at the Decatur, Ill., shops of the Illinois Traction System. The cost of the new equipment will be approximately \$180,000. It will be used for hauling freight cars and bring the total number of electric locomotives of the system up to thirty-six.

Track and Line

Georgia Railway & Power Company, Atlanta, Ga., has been granted permission by the City Council to extend its tracks on Highland Avenue, a distance of more than 2½ miles from the present terminus at Virginia Avenue.

New York, N. Y.—The Transit Commission recently announced that it had awarded the contract for the extension of the Fourth Avenue subway, Brooklyn, from its present terminus at Eighty-sixth Street to Ninety-sixth Street, Fort Hamilton, to the T. A. Gillespie Company, at the figure of \$1,725,884. Bids were received by the commission on Oct. 2. The Gillespie Company was the lowest of six bidders.

Princeton Power Company, Princeton, W. Va., is planning the construction of a sidetrack on Princeton Avenue, just west of the intersection of Black Street for the operation of cars from Graham, Va., to the Bluefield fair grounds without the necessity of transfer. Another switch is to be constructed between Hale's crossing and the state line. The company is considering the question of looping both Bluefield and Graham with a belt line.

Power Houses, Shops and Buildings

Northern Ohio Traction & Light Company, Akron Ohio. expects to link up with the super-power lines of the Cleveland Electric Illuminating Company. Work on the connection is progressing rapidly and it is expected that the new

supply will be available within the next few months.

Chicago, North Shore & Milwaukee Railroad, Milwaukee, is arranging to erect an addition to its present freight station which it now operates in conjunction with its street railway terminal at Sixth and Sycamore Streets. The cost of this new addition will be \$16,800.

Boston Elevated Railway is demolishing the remaining portions of its carhouse at Neponset which was damaged by fire months ago. The trustees of the company propose to build no more carhouses at present. The company will, however, build some inspection sheds large enough to cover hundreds of cars should it be found necessary. With this idea of outside or field storage of cars in view the Elevated officials are making substantial progress at Lotus Place in providing a modern yard layout to care for cars now using Jamaica Plain and old Lotus Place (Forest Hills) carhouse. There are now 177 cars at these stations and the new layout will care for 290. Jamaica Plain station is to be abolished. The land will be sold. Work is underway on the development of a modern yard at Salem Street, Medford station. The carhouse there is rapidly being demolished. Rapid progress is also being made at the Everett repair shops. The contract calls for the completion of the new shops on Oct. 26. The Boston Elevated expended \$1,027,614 on this unit up to June. The development comprises twenty-five acres.

Trade Notes

L. B. Breedlove will act as consulting engineer to the bond department of the Chicago Trust Company. He will advise in the analysis of public utilities and industrial properties in the financing of which the bank is interested.

Western Electric Company, New York, N. Y., announces that the general sales offices of its supply department is located in the Pershing Square Building, 100 East Forty-second Street. Herbert Metz has been appointed advertising manager.

Detroit Stoker Company announces the appointment of E. L. Beckwith as district manager in charge of the Chicago office, address Illinois Merchants Bank Building, 230 South Clark Street. Mr. Beckwith is an engineer with many years experience in stoker sales work.

Newhall Company of Ohio has filed a certificate of incorporation in the office of the Secretary of State. The corporation, capitalized at \$50,000, will engage in railroad construction work. Samuel B. Botsford, 925 Fidelity Building, Buffalo, is named as agent. R. M. Morgan of 1306 Williamson Building, Cleveland, is attorney.

P. W. Wood has moved his office to 1003 Carondelet Building, New Orleans. Mr. Wood is the Southern agent for

the Buda Company, Railway Track Work Company, American Cable Company, and has recently been appointed agent for the Witherow Steel Company. In addition to handling these accounts, he also does a general business in track material of all kinds.

Link-Belt Company, Chicago, announces the purchase of the Meese & Gottfried Company, San Francisco, Los Angeles, Seattle and Portland. The improvement in distributing facilities effected by the consolidation, and the additional manufacturing facilities acquired should give the rapidly-growing industries of the Pacific Coast highly economical and efficient service. It is the intention of the new owners to add to the facilities and enlarge present stocks, so that prompter service to its customers will be insured. The new organization will be known as the Link-Belt Meese & Gottfried Company with headquarters at San Francisco. The officials include Charles Piez (chairman of the board; B. A. Bayman, president; Harold H. Clark, vice-president and sales manager; Leslie W. Shirley, treasurer, and Richard W. Yerkes, secretary.

New Advertising Literature

Johns-Pratt Company, Hartford, Conn., has recently issued new catalogs on the Noark service boxes and the Noark universal service switches.

Reliance Electric & Engineering Company, Cleveland, Ohio, has issued bulletin No. 2014, descriptive of Type T Reliance motors for direct-current circuits.

Heine Boiler Company, St. Louis, Mo., has issued a circular describing the two boilers installed within the past two years in the plant of the Cambridge Electric Light & Power Company at Cambridge.

Hisey-Wolf Machine Company, Cincinnati, Ohio, has issued bulletin No. 1305, with illustrations, describing in detail the company's full line of new and improved two-wheel floor and bench grinders.

Combustion Engineering Corporation, New York City, has issued bulletin CB2, describing the Coxé traveling grate stoker. Typical evaporative tests of this stoker with various types of boiler are tabulated.

Mitchell Rand Manufacturing Company, New York, N. Y., has published a handbook called "Everything in Insulation." This book, of 160 pages, is printed on beautifully calendered paper, well illustrated, sewed and bound in a cover of flexible Spanish leather. It is written in words that the man in the shop can understand and put into practice in his daily work. Among the subjects treated are the selection of insulation varnishes, paper and wood as insulators, electrical insulating paints, etc. Compounds of every description for waterproofing, insulating, electrotyping, impregnating, filling, sealing, etc., are described in detail.

Efficient Arrangement of Machine Tools Goes Hand in Hand with Modern Machines

WHEN costs of turning steel wheels are compared, as in this issue, in the second survey article on wheel, gear and axle practice, a great variation is found. This is because the time required to turn a pair of steel wheels and the resulting cost of the operation depend on several factors. These include the skill or efficiency of the workman, the adequacy of the wheel lathe, condition of the cutting tools, the handling devices provided for getting the wheels to and into the lathe, the arrangement of the shop, layout of machines, convenience of storage space, and finally the condition of the wheels to be turned.

In general, the machine tool equipment for wheel and axle work is good only here and there in electric railway shops. A few railways have installed new wheel lathes or boring mills. Others have overhauled old tools and rearranged their shops to increase output. In all of these shops a marked improvement has resulted. By installing a new wheel lathe, using high-speed tool steel, and increasing the cutting speed, one road is taking care of wheel turning with two men where nine were used previously. The saving in labor alone will pay for the initial investment in two years.

Another shop had an excellent wheel lathe of late type, but the handling devices were entirely inadequate. The space for bringing wheels to and taking them away from the lathe was so cramped that one operation interfered with the other. Wheels were allowed to accumulate around the lathe to such an extent that the work of getting wheels into and out of the lathe was hindered. Furthermore, very little attention was being given to the quality and condition of the cutting tools, so that the lathe was operated at a slow speed. At this shop one machinist and a helper turn from eight to ten pairs of wheels in an eight-and-one-half-hour day, while at another shop, equipped with the same type of wheel lathe, but where particular attention has been given to handling devices, machine location and cutting tools, a man and a helper turn from sixteen to eighteen pairs of wheels in nine hours.

Railway shopmen are anxious to make a good record, and they work to that end when sufficient attention is given to the matter of tools and working conveniences, and to training of the men in modern shop methods. In the case just given, the output obtained from a \$22,000 investment was only 50 per cent of what it might have been with proper handling equipment and sufficient space for doing the work, which could have been provided for an additional investment of less than \$2,000.

Better cutting tools will prove a good investment. There is little use in spending money for an up-to-date wheel lathe unless the tools used on it will allow the machine to be operated at its full capacity. Tool grinders were found in most of the shops visited in making

this survey, but there was a wide variation in the way tools were ground. Even in the same shop, different machinists had different ideas of the angle, clearances and rake to be given tools, and they insisted on the tools they used being ground in accordance with their own ideas. By determining the best practice and making this uniform, much can be gained.

Modern machine tools applied to railway shop work are capable of economies that managements should know about. Improvements in present machines and their location in an effective plan should be considered, for in many cases good savings can be effected by this means, although this may be considered a substitute for a better plan, namely, new tools.

The Engineer in the Equipment Department

IN THE recent Annual Convention Number of the JOURNAL reference was made to the necessity for properly trained engineering organizations in the equipment departments of electric railways. It was pointed out that such an organization is necessary for the formulation and maintenance of company standards, and that through such work it can effect large economies by cutting down repair part stocks and eliminating costly maintenance delays.

Even on the larger electric railways there are very few instances where such engineering organizations have been developed to a degree warranted by the importance of the work to be done. On many properties the engineer in the rolling stock organization is entirely engaged in the work of preparing drawings for either new car construction or repair work. On other properties he is entirely occupied in experimental work. His work is frequently looked on as of a rather minor nature and he is frequently a comparatively young and inexperienced man who is willing to accept the compensation offered in order to broaden his experience.

Even these initial steps in the formation of an engineering division are to be commended, for there are too many instances on properties of considerable size where all development as well as routine maintenance is carried out entirely by shop foremen or mechanics under only the general supervision of the department head. In the interest of what is considered economy, very few drawings of any kind are prepared by the railway and new parts are made or ordered largely from samples or manufacturers' description. This limits the source of supplies, as many manufacturers cannot compete for the business because of incomplete information on the requirements.

It is time that the place of the engineer of equipment in the operating organization of the electric railway be recognized. In no branch of the industry is there an opportunity for greater direct economies from the appli-

cation of engineering methods of study and analysis than in the rolling stock and shops department.

The engineering division, in addition to carrying out the work of standardization which was discussed in the convention issue, should also include under one head all experimental work, all preparation of drawings and the studies of manufacturing and maintenance practices. To do this effectively the engineer of equipment should not be submerged in the maintenance organization but should be a member of the staff of the department head.

Most important of all, perhaps, in summing up the reasons why railways should maintain an equipment engineering division is the stimulus that this would supply in the general development of the electric rail vehicle. With all these engineers relieved of the burdens of routine maintenance and constantly thinking individually and collectively along lines of how to obtain better designs and more suitable materials, the cumulative effect in the industry would produce a much more rapid rate of development than has prevailed during the past ten years or so, during which the bulk of development work has been that done by the manufacturers due largely to competition.

What Is a Good Superintendent of Equipment Worth?

ON JULY 1 of a recent year a certain large railway company owned 633 cars, out of which only 360 were in service. This means that 273 cars were either in bad order or stored as obsolete. The number of pull-ins per day was averaging ninety, or 25 per cent of the cars in service, and the cost of conducting the mechanical department was \$1,300,000 a year.

With this as the situation, a new superintendent of equipment took charge. During his first year the expense of operating the mechanical department dropped to \$970,000, though ninety-five new cars were purchased whose maintenance was added to the work of the department. At the end of two years, with 728 cars total owned, the company had actually scheduled 690 cars. Only thirty-five cars were being held out for everything—wrecks, bad order, painting and general overhaul. The number of pull-ins per day was running from twenty-five to thirty, which is about 4 per cent of the cars in service, and the annual expense of the mechanical department had been cut to \$820,000. For completeness, this record of accomplishment should include a notation that of the motors which had to be maintained about half were from twelve to twenty years old.

How was it done? One of the first steps taken by this new superintendent of equipment was to install a system which enabled him to know his costs. He organized the shops for maintenance work and got some new machine tools and employed some first-class mechanics. The investment in the new shop tools was quickly gotten back out of the savings resulting in labor and the more rapid production. The old motors were put in shape and a systematic overhaul program inaugurated. The whole difficulty in the past had been deferred maintenance and a careless planning of work.

What is a superintendent of equipment of these abilities worth? He made a saving of nearly half a million dollars in two years time in the annual cost of operating the mechanical department. But even more important than that, he increased the number of cars available for service, and therefore improved the company's ability to earn revenue, from 360 cars to 690 cars.

But what was this man paid? His annual salary was about 1 per cent of the saving he had been able to make, and it was only 0.6 per cent of the reduced annual expenditure of the mechanical department. He left the company after two years to accept a more lucrative position offered him in the manufacturing field.

When a man of this ability has demonstrated his worth, one would think that a railway company would not permit any one to deprive it of his services. The need for skill in railway maintenance work and the opportunity existing for making large savings are very great. Ability applied here should be paid for just as well as anywhere else.

Wood Preservation Means Forest Conservation

FOREST conservation is an extremely important national problem in this country, as this paper has pointed out at various times. Likewise it is one of growing seriousness as the timber is cut and not replaced. The situation is well expressed in the words of the late Joyce Kilmer:

"Poems are made by fools like me,
But only God can make a tree."

Even this does not tell the whole story because it does not tell how long it takes God to do the work. The rapidly disappearing forest is not a myth. It is a fact only too well understood by our Forest Service but unfortunately not yet appreciated by a great number of the larger consumers of timber.

There is, however, a method of conserving timber which is open and available to every one; that is, the preservation of it by certain well-known methods of treatment. The wood preservation committee of the American Electric Railway Engineering Association, which functioned for the first time this year, gave a great deal of information in its report as to how treatment of wood for railway purposes may be accomplished. The methods of treatment which are discussed in the report are such as are available to practically every user of timber. Their application will increase the life of the timber a great deal, the better methods making the life more or less indefinite. In fact, mechanical wear is the cause of most failure of timber thus treated. The results to be obtained from the various methods of preservation are fairly well known and guesswork has been practically eliminated.

Despite the work that has been done in the preservation of wood, the use of preservatives is not spreading as rapidly as would be desirable for the good of our forests. Figures presented elsewhere in this issue show that the amount of wood being treated at the present time is but little in excess of the amount being treated ten years ago. While this is due to some extent to policies of retrenchment that have been in force, still a great deal of untreated wood is used where proper preservative methods should be applied. The work of the wood preservation committee should bear practical fruit if its efforts result in a greater attention to treatment of timber.

It takes many years to reap the benefit of reforestation, but the benefits of wood preservation are available at once, and its immediate adoption would greatly lighten the burden on our already overtaxed forests. Wood preservation is an economic necessity which must sooner or later be recognized by every industry using wood for structural purposes.

Wheel, Gear and Axle Practice—II

Efficient Arrangement of Machine Tools with Ample Provision for Placing Material Into and Taking It Out of Machines Reduces Cost and Time Necessary for Wheel and Axle Work—Storing Both Rough Material and Finished Products Adjacent to Machines Where Work Is Done Has Advantages—Savings Possible with Modern Machine Tools

The first article on this subject was published in the ELECTRIC RAILWAY JOURNAL for Aug. 18, 1923. It contained information of the mileage obtained and costs resulting from the operation of cast iron and steel wheels, together with a discussion of some conditions that limit the life obtained from wheels and the expedients used to increase mileage of wheels in service. In this, the second article of the survey, methods, equipment and shop arrangement used in maintaining wheels and axles are treated.

IN CONSIDERING the various shop layouts of the sixty railways visited in making this survey it was found that in most cases the machines for wheel and axle work were grouped in one section of the shop. This proves particularly effective in reducing the number of times that wheels and axles must be handled and it also reduces the amount of handling equipment needed. Where railways have several shops at which inspection and overhauling are done, wheel and axle work is quite generally centralized at one shop. On most of the larger railways the system is organized into divisions, and wheel and axle work for the different divisions is done at the shop most centrally located. Wheels and axles requiring maintenance work for the different divisions are sent into and returned from the wheel and axle department on supply cars. These supply cars are usually provided with a derrick for quick handling. The larger systems have a definite schedule for the operation of such supply cars and by this arrangement a single car and crew can take care of the entire distribution. On one system the supply car was said to average only

180 miles per six-day week. This shows how great a saving in mileage can be made by bringing car equipment to the places where the cars are housed rather than by running the individual cars to a distant shop for every change in wheels or axles.

The equipment in the wheel and axle departments will vary, of course, with the number of cars and the variety of wheels used. Where steel wheels are used the wheel and axle department will ordinarily have a wheel press, boring mill, wheel lathe and axle lathe. In addition some shops have an axle straightener, welding machine for building up flanges and axles, and a few have a milling machine for cutting key ways. Railways using cast iron wheels in most cases have a wheel-grinding machine of some form, either pit type or floor type.

The wheel presses used for electric railway service run from 250 to 400 tons capacity, with a large major-

ity using the 300-ton size. Wheel lathes and boring mills are used in sizes from 34 in. to 48 in., with a majority of roads favoring the use of the 42-in. size. Axle lathes are used in sizes from 20 in. to 36 in. Jib cranes are quite universally used for serving the individual machines, with some provisions for moving the wheels and axles about the department, or to and from storage by either overhead traveling cranes, traveling trolley hoists or wheel and axle wagons.

A convenient and well arranged wheel storage is a great time and labor saver. A very satisfactory arrangement is used at the Chattanooga shops of the Tennessee Electric Power Company. A concrete platform has been constructed at the sides of the shop on the same level as the shop floor. One of the yard tracks runs alongside the platform so that wheels can be loaded readily on and

Boring Mill in Boston Elevated Railway Shop, Equipped with 15-Hp. Motor and with 1,000-Lb. Air Hoist

The tool spindle of this boring mill has provision for three tools, one for making the rough cuts, one for the finishing cuts and one for the fillet cuts. The various cuts can be made without changing the position of the wheel on the bed.

and overhead traveling hoists is particularly effective for handling various equipment parts.

Arrangement of Wheel Work in Shop of the Tennessee Electric Power Company—The wheel and axle department of the company in Chattanooga, shown in the lower plan, is adjacent to the shop overhauling tracks. Supplies are delivered to a concrete platform along the side of the building and are handled from this storage to machines. A cir-

Platform for Wheel Storage

Wheel and Axle Work at Terre Haute, Norfolk and Chattanooga

In the shops of the Terre Haute Traction & Light Company, shown in the top plan, a wheel press, boring mill and axle lathe are all located adjacent to the truck overhauling track. Three jib cranes and an overhead traveling hoist are used for handling the wheels and axles. Wheels that require removal are taken to the wheel press and axles that require turning to the axle lathe by the overhead traveling hoist. New wheels are stored on a platform just outside the shops. After rolling in through an adjacent doorway, they are handled by a jib crane and the overhead traveler to the boring mill for boring. After finishing, they are sent to the wheel press for mounting. From here the wheels are rolled and handled by the crane to storage, which is on shop tracks outside the shop. Wheels are turned by the use of an oxy-acetylene torch as described in the *ELECTRIC RAILWAY JOURNAL* for July 21, page 104, and as a result a wheel lathe is considered unnecessary.

Handling Wheels and Axles at Norfolk—The wheel and axle department of the Virginia Railway & Power Company, Norfolk, Va., shown at the right, is located at the end of the shop between tracks used for truck overhauling and for general inspection work.

Wheels that have reached their limit of wear are handled direct from the truck overhauling track to the wheel press by means of an overhead trolley hoist. A jib crane is also conveniently located to serve both the wheel press and wheel lathe. New wheels are stored on a concrete platform outside of the shop. They are rolled from this storage to a doorway and from that point are handled to the boring mill by the same overhead traveling hoist which runs entirely across the shop. After finishing and mounting, the wheels are stored on two tracks adjacent to the boring mill. Axle work is done on two lathes adjacent to the wheel boring mill. This arrangement of jib cranes

cular I-beam traveler reaches across the two truck overhauling tracks, as described in the *ELECTRIC RAILWAY JOURNAL* for July 21, 1923. The front end of the overhauling track is equipped with four overhead I-beams, each with two air hoists for convenience in lifting car bodies. Wheels that have reached their limit of wear are taken from the truck and handled by an overhead trolley to the wheel press. From the boring mill, wheels are handled to the wheel press by the overhead trolley bar.

Eastern Massachusetts, Third Avenue and Puget Sound Companies' Practice

The Chelsea Shops, shown at the right, handle all wheel and axle work for the Eastern Massachusetts Street Railway System. A supply car picks up the wheels and axles requiring repairs and brings them in. The wheels are unloaded by a crane and placed on tracks A and B. Wheels with worn flanges are placed on track A and are then rolled into the main-aisle track C. A telfer removes the wheels from this track and

and axles are received either from cars which run into the shop on the balcony, or from the truck overhauling shop, adjacent to the wheel and axle department. Both of these, together with other departments, are served by a large overhead traveling crane, which delivers the incoming material to the particular track or location designated for receiving it. After inspection the units are routed in three ways: First to the wheel press for dismounting, if any part is to be scrapped, or should an axle need to be turned or straightened; second to the grinder, for cast-iron wheels, and, third, to the lathe for turning steel wheels.

Wheels and axles are finished in the boring mills and axle lathes and then stored in their particular section. They are handled from these storage points to the wheel press by means of a large jib crane. After the units have been assembled they are routed either direct to the wheel lathe or grinder, if work by these tools is required, or to the outgoing tracks for inspection.

The wheel press is served from the floor by the transfer table and by a 1-ton air hoist mounted on a 10-ft. jib crane. The wheel lathe is served by a 1-ton electric hoist, mounted on a 22-ft. radial roller crane. The wheel grinder is served by a 1-ton air hoist mounted on a 10-ft. jib crane, and a 20-ft. jib crane equipped with a 1-ton chain hoist takes care of the axle lathe and the boring mills.

places them in position in the automatic welder, where worn flanges are built up. After this operation the wheels are again removed by the same telfer system and by a swinging post derrick which serves the wheel lathe. After turning wheels are placed on the outgoing track B for delivery to the supply car.

Wheels which have reached their limit of wear are delivered by the car to track B, from which they are rolled to the wheel press, where they are removed. New wheels are taken from storage directly under the electric derrick and are installed. The electric derrick also serves the boring mill, to which new wheels are taken in quantities of twenty. Here they are bored to their respective dimensions and then laid aside for mounting. Axle work is done by the machines at the left in the upper illustration.

Speedy Routing a Feature of Third Avenue Shops—The wheel and axle department of the Third Avenue Railways, New York, shown in the plan at the left, presents an orderly and compact arrangement. Wheels

Equipment for Wheel Repair in Shop at Tacoma, Wash.—Wheel and axle work for the Puget Sound Electric Railway, the Tacoma Railway & Power Company and the Pacific Traction Company is taken care of at the Tacoma shops, shown above. A large wheel storage space is provided adjacent to the general machine shop. This has four rails on the track in order to increase the storage capacity and is served by an overhead traveling telfer. Wheels and axles that require machining are delivered on the track in the general machine shop. Where wheels are to be scrapped or axles turned or straightened, these are delivered to the hydraulic press. Wheels that require re-turning are routed to the wheel lathe. New wheels are bored out in the boring mill and axles are turned in a 36-in. lathe. All these machines are served by jib cranes, and in addition a differential chain block on an air-operated monorail overhead hoist runs the length of the shop over the track. The welding room forms one corner of the shop and flanges are built up where warranted.

Motor-Driven 250-Ton Hydraulic Wheel Press in Chelsea Shops of the Eastern Massachusetts Street Railway

This press is equipped with triple pumps and has hydraulograph attachment.

off the storage platform from a car run alongside. The center part of the platform is taken up by a bay projecting out from the shop. Folding metal-covered doors are provided at each side of the projection. An overhead hoist travels the entire length of the platform and the overhead track on which it runs extends through the shop projection. With this layout wheels can be picked up by the hoist and handled into the shop and placed right at the machines. Scrap wheels are taken out and placed in position for loading in the same manner. This system involves but one handling in either case. New and scrap wheels are kept separate by using one end of the platform for new material and the opposite end for scrap. Accompanying illustrations show the platform and the interior arrangement of the shop, with wheel press and 42-in. boring mill located right at the projecting bay. Several other railways have found a great advantage in having storage space for rough material in the immediate vicinity of the tools on which the work is done, rather than in a general storeroom.

The storage of wheels, after they are mounted on axles, usually is taken care of in a space with tracks and the wheels are placed on the tracks. In order to economize on space several railways have provided this storage with gauntlet tracks, one rail being placed between the rails of the adjacent track. Wheels when stored are then staggered so as to fit inside those on either side. This arrangement is of particular advantage where mounted wheels are stored inside the shop adjacent to the wheel and axle department. It has been successful in the Sixty-fifth Street shops of the Third Avenue Railway, New York City, and in the Tacoma shops of the Puget Sound Electric Railway.

A number of layouts of the wheel and axle departments for different railways are shown in accompanying illustrations, and where a particular routing is followed for the work this is given. In most smaller railway shops, however, very little attention is given to routing the work to the different machines. Of course it is not such an important factor here because wheels and axles are taken out of trucks for some special attention and they go directly to the machine where the work is to be performed and when finished are often either returned to the same trucks or taken to storage. On the larger railway properties more attention has been given to the location of the various machines so that the work can be handled from one operation to the next without interference and with the least labor.

SHOP REARRANGEMENT INCREASED OUTPUT 50 PER CENT

An accompanying illustration shows the recently rearranged wheel and axle department of the Third Avenue Railway, New York City. Particular attention was given to routing the wheels and axles and an orderly and compact arrangement resulted. Incoming and outgoing material are kept entirely separate. As a result of the rearrangement, production of pairs of wheels necessary for delivery to the truck overhauling shop and to the various carhouses was increased 50 per cent and at the same time the cost per pair of wheels handled was reduced 20 per cent. By providing ample labor saving devices for handling, not only were costs reduced and production increased, but inspection of the

Left—Wheel Storage Platform at the Chattanooga Shops of the Tennessee Electric Power Company. Right—Extension of Shop Over Platform Facilitates Bringing Wheels Into the Shops for Machining

finished material is made in a more thorough and orderly manner. This is of particular advantage in this shop, due to the piece work system employed.

OLD TOOLS CAN BE PARTLY MODERNIZED

Along with the rearrangement of machine tools, two railways report changes in the machines themselves in order to provide for increased duty. In Brooklyn two wheel lathes had their 15-hp. motors replaced by motors of 40-hp. capacity. New spool castings with heavier face plates, new drivers and pneumatic tool clamps were also installed. The rugged construction of the lathes made it possible to take advantage of high-speed operation so that the output of each machine was increased 100 per cent.

A 36-in. wheel lathe in the Sixty-fifth Street shops of the Third Avenue Railway was provided with two new tool posts. Additional parts for the old ones were also purchased so that these are held in reserve. A double wheel grinding machine was overhauled and the driving rigging was improved. A new exhaust system was also installed.

Several railways have increased the efficiency of wheel and axle departments by installing new machines and replacing hand-operated chain hoists by a motor or pneumatically operated type. Several of the new type boring mills used by electric railways are equipped with air hoists integral with the machine and with provision for several tools on the tool spindle. The various cuts necessary in finishing a wheel can thus be made without changing the position of the wheel on the bed. This convenience together with better facilities for handling has enabled a 34-in. wheel to be bored in fifteen minutes, whereas with older equipment seven pairs in an eight-hour day was the limit.

A late type of wheel press is used in the Thirty-sixth Street inspection and overhauling shop of the Brooklyn-Manhattan Transit Corporation and in the Morris Park shops of the Long Island Railroad. These have provision for four tools in each of the two turret toolposts. The tools used are a roughing tool for the wheel tread, a flange roughing tool, a combined tread and flange finishing tool and a chamfering tool. This is a 42-in. lathe on which a $\frac{3}{8}$ -in. cut can be made at

Wheel Lathe in Boston Elevated Railway Shop

This lathe has repeatedly turned a pair of steel wheels in fifteen minutes. It is driven by a 50-hp. motor and has two tool posts, both wheels of a pair being turned simultaneously. The tailstock is driven by a 6-hp. motor and an air hoist above the lathe handles the work. The lathe has a 42-in. swing.

high speed. An average of two pairs of wheels per hour is being turned out in the Thirty-sixth Street shops. Through the use of the efficient clamping arrangement provided, wheels can be removed and new ones put in place for turning in two minutes. One man and a helper are used in operating this wheel lathe, and they are turning out as much work as was previously done by nine men and several older type machines.

Left—Huntington, W. Va., Shop of the Consolidated Power & Light Company, with Overhead Traveling Crane to Serve the Wheel and Axle Department. Right—Boring a Wheel in the Tacoma Shops of the Puget Sound Electric Railway.

A Portion of the Wheel Lathe Is Seen in the Background at the Right

Work at Shops of Waterloo, Cedar Falls & Northern Railway

A round house serves as a shop for the Waterloo, Cedar Falls & Northern Railway. Wheels and axles are removed from trucks on the tracks used for truck overhauling work. An electric crane mounted on a small car transports the wheels and axles from the dismantling track to the turntable and then to the machine on which the repair work is to be done. The shop is equipped with two axle lathes.

The track serving the 36-in. axle lathe also serves the 36-in. boring mill and wheel press, so that the wheels requiring removal are brought in on this track to the wheel press, and if the flanges and treads require turning they are handled on the adjacent track direct from the crane car to the wheel lathe.

New wheels can be brought in on a track adjacent to the boring mill and after being bored can be stored alongside. When they are required for mounting, they are handled from this position to the wheel press.

Shop of the Iowa Railway & Light Company, Cedar Rapids, Iowa

The floor level of the wheel and axle department in this shop is approximately 4 ft. below that of the pit track. Drop pit elevators are used for removing the wheels and axles from cars, and they are thus delivered to the wheel and axle department. Where wheels require renewing they first go to the wheel press and the axle then is delivered, if re-turning is necessary, to a 26-in. lathe by means of a chain hoist. After turning, it is again delivered to the wheel press for mounting. The location of the wheel and axle department adjacent to the truck overhauling department is found particularly convenient.

West Shops of Chicago Surface Lines

A track leads direct to the wheel lathe for turning wheels with sharp flanges. Where wheels are worn to the limit, they are handled from this track to the wheel presses. Three wheel presses mounted in a row are used as indicated for wheel removal and mounting, and an axle straightener is conveniently located at one end. On new work, wheels are taken from the wheel storage and rolled to three boring mills. Wheels are thus bored out to fit the various axles on which they are to be pressed and are then handled by cranes to the wheel press used for installing wheels. Axles are turned in a battery of lathes in the machine shop, adjacent to the wheel and axle department.

Wheel and Axle Equipment of the British Columbia Electric Railway

Wheel work in Vancouver, B. C., is done in a section just to the rear of the overhauling shop. A high-speed wheel lathe, 120-ton hydraulic press, wheel boring mill and tire-shrinking stand form the equipment. These are served by two jib cranes. Wheel storage is provided just back of the wheel press, and axle work is done in the machine shop, adjacent to the wheel department. Tires are also bored on a boring mill in the machine shop. The tire-shrinking stand has a concrete base with central hole and steel blocks to hold the wheels.

Wheel and Axle Department Adjacent to Truck Overhauling Track in Knoxville

Wheels requiring removal can be handled directly from the overhauling tracks to the wheel press in the shop of the Knoxville Power & Light Company. A 23-in. heavy duty lathe located in the corner is used for turning steel wheels, but as both cast iron and steel wheels are used on the system, this machine is required infrequently for this work, but it is also used for turning axles. A 42-in. boring mill with a five-jaw universal chuck is used for boring out wheels and gears. Two other lathes, one 16 in., the other double-spindle motor driven, are used. An I-beam overhead traveler serves this department. The shop floor is made of wood blocks.

Wheel and Axle Practice of the Tri-City Railway, Rock Island, Ill.

No provision is made for grinding or turning wheels in the wheel and axle department of the Tri-City Railway at its Rock Island shop, as interurban steel wheels are sent out for turning and wheel-truing brake shoes are used for grinding cast wheels. The wheel and axle department is at the rear of the truck overhauling tracks. After removal, wheels are placed on the transfer table and from this are picked up by a traveling chain hoist. This overhead traveler serves the wheel and axle department and the machine shop. Axle work is done in a lathe in the machine shop. Wheel storage is provided at the side of the shop adjacent to the wheel and axle department, and a door opening is provided so that wheels can be handled from storage by the overhead traveler.

Portland Railway, Light & Power Company

The wheel department of this company in Portland, Ore., has a concrete floor and is traversed by one track. Wheels come in from the various divisions on flat cars and are unloaded by an overhead air hoist. They are rolled about the floor by hand, and the various machines have jib cranes. Outdoor wheel storage is provided at the entrance.

Left—Handling an Axle After One Wheel Had Been Removed in the Shops of the Terre Haute Traction & Light Company. Right—A 42-In. Boring Mill with Hoist Attachment Is Used for Wheels in the Shop of the Indianapolis Street Railway

The wheels are brought into and taken away from the wheel press on two tracks, one above the other—one on the floor level and the other elevated above this a distance of about 4 ft. Wheels requiring turning are brought in on the upper level and the finished wheels go out on the floor level. This arrangement is convenient for locations where space does not permit having two tracks on the same level.

GREAT VARIATION IN COSTS OF TURNING WHEELS

In analyzing costs for turning steel wheels a considerable variation was found. This is explained by the great difference allowed in the wear of wheels on different properties by the varying facilities for handling, and whether or not the machine tools used are modern or out of date. Some roads remove wheels for turning at quite frequent intervals and do not allow flanges to become very sharp, while others allow a large amount of flange wear. Some high-speed inter-urban railways feel they would be taking a chance of having accidents if flanges were allowed to become sharp. Some others find flanges wear more rapidly after they are partly worn and while continuing them in service watch them very carefully during the latter period of use. When the flange wear appears excessive the wheels are removed and turned.

The amount of metal which must be turned off the tread, of course, depends on the condition of the flange, varying from $\frac{1}{8}$ in. to $\frac{3}{8}$ in. Very few roads keep a record of the amount of metal turned off, so it is impossible to give a comparison of costs per inch depth of tread metal removed. Costs reported for turning a pair of steel wheels range from 35 cents to \$2, with an average of about \$1.25. Several large railways are obtaining excellent results from the piece-work plan of payment for wheel turning. The Interborough Rapid Transit Company, New York City, has used the piece work system since 1912, and some interesting figures of the results obtained in turning steel wheels were published in the *ELECTRIC RAILWAY JOURNAL* for March 17, 1923. By using the latest improved machinery, high-speed tool steel and the piece-work plan the output in this company's shop has been increased to twenty-five pairs of wheels per day per man. It should be mentioned, however, in this connection that the Interborough company does not allow its wheel flanges to become excessively worn, so that the amount

of tread metal removed per turning is less than that for most electric railways.

Tool grinding machines are also very important adjuncts to a wheel and axle department. In most railway shops grinders are located either in or close to the tool room. In comparing the amount of work turned out by similar machine tools, the importance of close attention to cutting tools was very apparent.

Tower Wagon in Shanghai, China

COOLIE labor is very cheap in Shanghai, China, and as a result it is used as the motive power for various maintenance of way and line vehicles. The accompanying illustration shows a trolley inspection and repair wagon in position for making repairs. Without pressure on the handle a support is in contact

Making Overhead Repairs in China

with the roadway and this, together with the wheels, gives a firm foundation. By pushing down on the handles the tower balances over the wheels and can be readily transported by the Chinese coolie. While coolie labor is used for truck vehicles, it is quite evident from the accompanying illustration that automobiles are quite generously used for passenger riding. The trolley lines are also reported as being very liberally patronized by

the Chinese residents of Shanghai, who are very fond of riding on the street cars and other conveyances.

Putting Overhaul on a Production Basis

Many Methods Developed by Manufacturers Can Be Applied to the Railway Repair Shop—Scheduling All Work Can Be Done and Non-Productive Time Cut Down—Labor-Saving Devices Are Advantageous

*By Henry S. Day**

Railway Department Westinghouse Electric & Manufacturing Company

ALL successful manufacturing plants turn out their product on very definite schedules built up for the necessary processes and operations required to turn the raw material into a finished product. The one aim sought is to keep the workers continuously performing their allotted tasks without interruption caused by shortage of raw materials, non-progressive movement of work in process and shutdowns of machines due to plant failures.

To accomplish this a manufacturing program is planned months ahead of time. The first thing done is to obtain the raw material. Careful studies are made of the various machine tools needed in the process, and the capacity is figured to get daily output of each machine. Each lot of parts, then, is routed and timed to progress without blocking other lots, or keeping machine tools idle waiting for work, or overloading them, thereby keeping operatives idle waiting for parts.

PLANNING TO CUT DOWN NON-PRODUCTIVE TIME

Two of the greatest difficulties are to cut down non-productive hours and time required to handle or move material, either raw or in process of manufacture. Unless this planning is incorporated, serious losses will result. For many years little thought was given either to this feature or to the arrangement of buildings, machinery or facilities; but at present a new manufacturing plant has incorporated in the initial plans all of the physical arrangements that will make possible concentration of departments, progressive movement of raw materials, and work in process. Even the make-up of the organization that will operate it is provided for.

While this has been true in the case of leading manufacturers, it has not been applied to the same extent by the electric railways in the big shops they must operate to maintain their rolling stock. These shops employ large forces of men and use great amounts of material. While the operations do not duplicate those in a manufacturing establishment, unquestionably many of the money-saving methods and facilities of the latter can be applied to the car repair shop.

A schedule in the electric repair shop reduces to concrete values the work to be done, and makes possible the planning that bridges over the time between purchase of the materials and when the car actually enters the shop for overhaul.

The first and greatest problem in successfully overhauling cars is to carry in stock at all times the right kind and quality of materials and supplies to meet the production schedule of a definite number of cars overhauled per day, and to make it possible to order in a car on a predetermined date and turn it out exactly on another predetermined date. The effectiveness of any production schedule is lost if this is not done, and it cannot be done unless material is available.

Co-operation between the shop and the stores department must exist to the highest extent. Unless the purchasing agent and storekeeper are working months in advance of shop schedules they cannot be expected to supply the demands. Cars running long over the shop-ping time planned not only demoralize the shop schedule, but hold rolling stock out of revenue service. A definite schedule, closely followed, also supplies the only means whereby the master mechanic can aid constructively the storekeeper in properly ordering stores.

In speaking of a production schedule, it is not sufficient to figure how many cars will have to be overhauled each year from the number owned and the total miles operated. It is very simple, for instance, to figure that for a road operating 1,000 cars averaging 3,000 miles per month, an overhauling period of 50,000 miles will require each car to be shopped approximately every 16½ months; and that to do this, working 300 days per year, it would be necessary to put through the shop 2.4 cars per day. This is but the beginning. Besides the regular overhaul a certain number of wrecked cars have to be expected, and there are a good many heavy repair jobs on bodies and trucks, besides a certain number of motor and wheel changes. The number per year of the latter cannot be figured accurately, but averages can be approximated and made a closely adjusted part of the shop program.

Using the number of cars that must be overhauled per day, with the wrecks and other repair jobs arranged and classified as a daily output, it is necessary to work back into each department of the shop and figure out the number of repair jobs or amount of daily production that the department can turn out. Sufficient parts are needed to supply the demands of the cars scheduled out. The individual departments have, further, to be enough in advance of the cars due out to allow time for installation of the parts on the car.

To keep these departments working with a minimum of men and well-balanced production—that is, not overloaded one week and slack the next—a fair amount of extra or spare parts and apparatus is needed for a working surplus. To allow a department to become slack and temporarily to transfer men to some other department is inefficient and accomplishes little. With a properly figured out schedule there should not be any departments that could transfer men.

REPAIR WORK IS MADE UP OF REPETITIONS

Overhauling consists of dismantling, repairing, and replacing worn parts with new parts ready manufactured, and assembling. It cannot be placed on the basis of a manufacturing plant turning out a given product in which a given number of operations are merely repetitions. Yet with a comparatively few exceptions, operations in a repair shop are also repetitions. The difficulty of grouping these lies in changing from one job to another, but by building the schedule on the process

*Formerly superintendent of equipment Kansas City Railways.

required a very accurate shop program can be arranged. Such a schedule will place each department on a given performance and will indicate quickly what hours are productive and what are non-productive.

One of the principal factors in the balanced production of a department is the delivery of parts for repair and the necessary material and the routing of the repaired parts. Concentration and proper group arrangement will cut down very quickly the rehandling and lost time. The arrangement of the shop buildings frequently is responsible for double handling and back track moves. Even in existing shop buildings, a great deal can be done to reduce expensive movements.

A SMALL LABOR GANG CAN HANDLE TRANSPORT OF PARTS

It would seem better to keep the foreman and the men at the department location, and have all material movement under the control of one man with a small labor gang, using electric trucks and cranes to supply the wants of all departments on a regular schedule, than to have work interrupted while workmen, or even worse, foremen, fetch and carry.

To illustrate this point a car is placed on an overhaul pit, where it is raised by mechanical means and blocked in place. Trucks will be run out from under on their own power, and removed to truck overhaul pits by electric crane. Parts and apparatus will be moved to the various departments either by electric crane or electric trucks, and all repaired parts and apparatus returned in the same manner.

The entire material movement will be carried on under the supervision of one man. It is this man's business to see that the material movement is carried out without interference and that operations on the car body move steadily and without delays. During the process of overhauling the truck, for instance, the foreman of the truck department will issue storeroom requisitions for renewal parts, which he will turn over to the man in charge of material movement; and the material will be returned from the storeroom and delivered to the truck department by electric truck.

This system can be applied to a force of surprisingly small size. The returns in reduced labor costs and elimination of lost time waiting for materials will pay for the investment in trucks, etc., many times over. The effectiveness of a shop schedule can be much hampered by material movement. Replacing manual labor by quick-moving machinery will produce sure results.

FOREMEN AND INSPECTORS MUST KNOW THEIR JOBS

In stripping down and building up a truck the man who supervises the job and the men who accomplish the work must know how to turn out a truck with all parts having the same clearances, bearing surfaces, alignments, and standards as were set by the builder. The man who makes the final inspection must know whether the work has been done right. This applies to all parts of the equipment in the same way that it does to a truck, and the necessary precision with which the work is carried out depends entirely on the way the equipment is designed and built. In order to obtain results that will permit the equipment to perform the work it was designed to do, it must, after an overhaul, be reassembled just as accurately as when it was first built. There must be an exact adherence to adjustments, fits and quality of the parts replaced. A liberal use of accurate gages, thorough and intelligent inspection,

careful testing, preceded by a thorough practical knowledge of results required, are needed in the individual operations just as much as schedules and system are needed to control production.

It follows that if a repair shop should be placed on a production schedule with the chief product an overhauled car, the organization and its control should be made up on the same basis, the supervisory force consisting of specialists with ample supervision.

No small factor in the efficiency of a shop is a plentiful supply of well-designed, high-grade, small hand tools and labor-saving facilities. A repair shop without them will waste time, because repair work necessitates frequent changes from one class of job to another and trucks, motors, and auxiliary apparatus are dirty, rusted, and greasy, consequently hard to take apart.

A good share of the work has to be carried on in a manner that makes it impracticable to use machine tools, and hand labor predominates, but it can be speeded up with high-grade power tools. Electrically-operated cranes and hoists, electric lift trucks, and devices of this nature, will always warrant the initial cost in time saved. Much time is lost removing grease and dirt in preparing parts for assembly and machine operations, and well-designed devices to replace hand labor will help costs materially. A lye vat large enough to take a complete truck frame is one of the best of these.

Plenty of light scientifically distributed, air, gas, electric current and water carried to every point where they have a possible use, with numerous outlets arranged to cut down waiting time and steps, are necessities and at the same time economical.

ORDER AND SYSTEM ARE ESSENTIALS

An editorial in the *ELECTRIC RAILWAY JOURNAL* of May 19, 1923, entitled "Orderliness and System in the Truck Shop" stated: "The general impression that one carries away from visits to most of these [shops] is one of disorder," and also, "Without doubt one of the least expensive improvements that can be made, and still one that will produce important results, is that of systematizing the work and maintaining an orderly truck shop." Frequently this can be applied not only to the place where trucks are being overhauled, but also to the entire shop. This results in a daily loss, because workmen feel the effect of disorder and dirt to the detriment of their performance.

The fact that aisles are blocked, or are not provided, parts are scattered, and floors are dirty and greasy, causes no small loss of time. It takes longer to move from one point to another on a crooked path than on a straight one, and longer to find parts if they are scattered than if they are placed for use following a thought-out plan to save time and movements. Much can be done with this idea alone. Good workmen do not live in dirt and disorder at home, and they do not like to work in it. Such conditions are pretty sure to cause the workman to slow down and to become careless of his time and the company's property. Temporarily discarded parts or half-finished jobs allowed to lie around on floors and under benches day after day will have the effect of making him more or less indifferent, because he rather logically figures out that if the management can afford to allow parts that are clearly of value to kick around with apparently little thought as to their ultimate use it is no affair of his. He also is very likely to treat as inconsistent constant cautions to practice economy and prevent waste.

There is nothing that will kill the interest and efficiency of good workmen so quickly as to allow plant equipment to run down and get out of repair. It is no more consistent to expect a shop force as a whole to produce good results with a plant in which tools and equipment are generally in need of repair than it is to expect an individual workman to unbolt a suspension bar with a worn-out wrench.

Many old shops can, without the outlay of a great deal of money, have their operating costs reduced and their production increased by adopting some of the methods, systems, and facilities already developed by out-and-out manufacturing concerns, who would not even consider repair work. On the other hand, many repair shops are engaged in more or less comprehensive programs of manufacturing renewal parts, with the idea that economies are being effected, while everything

about their organization and plant would indicate that this feature of their operation is hopeless competition, and that they have been drawn into it either through the difficulty of obtaining renewal parts from the manufacturers or because they do not know their actual costs.

To quote again the *ELECTRIC RAILWAY JOURNAL* of May 19, the editorial headed "Good Savings by Improvements in the Old Shop" states that "Many operating officials consider the shops a necessary expense and look with little sympathy on any proposal to put more money into these facilities," which is not only true but states the case rather mildly.

There are real opportunities for economies in the mechanical departments of electric railway properties. The shops offer fertile ground, and the head operating official will find it profitable to give this department of his road closer scrutiny.

Double-End Pay-as-You-Pass Car Introduced in Brooklyn

Two Hundred Cars, Just Being Placed in Service, Are Arranged for Front Entrance and Center Exit—Novel Scheme of Exterior Painting Attracts Attention—Variable Load Brakes and Electro-Pneumatic Door Control Are Used

A NOVELTY in merchandising transportation is being used by the Brooklyn City Railroad as a means of introducing its new front-entrance, center-exit cars. Between the belt rail and the bumpers the dash is painted peacock blue, and from the headlight as a center there extends a striking spider web of yellow and red, as shown in an accompanying illustration. The purpose of this unusual color scheme is to draw the attention of the public to the new cars. Posters in every car operated by the Brooklyn City Railroad will explain a couple of days in advance about the introduction of the new type cars, and when they actually appear on the street arrayed in these brilliant colors they will stand out conspicuously in contrast to all other cars in the city. The public will therefore more readily

grasp the fact that the Brooklyn City Railroad has put 200 new cars into operation. At the same time this color scheme has a practical value in that it will inform prospective passengers when the approaching car is of the front-entrance type. This is important because there are no other front-entrance cars in Brooklyn, except the safety cars.

First deliveries of these cars are now being made and it is expected that they will be placed in service early in November. The cars are of the double-end type with front entrance and center exit, designed primarily for two-man operation in heavy city service, although they are so equipped that they can be operated by one man, if it is desired. When the car is operated by two men, the conductor stands in the middle of the car, near the

The First of 200 New Double-End, Front-Entrance, Center-Exit Cars of the Brooklyn City Railroad

By Using All Available Space a Seating Capacity of Fifty-three Has Been Secured

center exit, and the passenger pays his fare as he passes on his way to the exit or on his way to the rear half of the car. This arrangement has been adopted with the idea of speeding up passenger movements.

FEATURES OF UNDERFRAME DESIGN

Clearance is always a serious problem in the design of a street car for service in Brooklyn. The location of pillars of the elevated railway structure, especially the location of columns at the ends of the Brooklyn and Williamsburg Bridges, is such as rigidly to limit the length and width of surface cars. Small clearances exist also on several other city-owned bridges. Inasmuch as the new cars are designed for heavy city service, it was desired to have them of maximum size, and it is claimed that not a single inch could be added to the over-all dimensions of this car without causing trouble where the clearance is small. The length is 44 ft. over bumpers, with truck centers 21 ft. 6 in. The width over all is 8 ft. 3 in. Each platform is 6 ft. 3 1/2 in. long. By tapering the platform from its maximum width at the bulkhead to a width of only 6 ft. 8 in. at the vestibule corner posts it has been possible to design a car of this size without exceeding the clearance limit.

In order to keep within the desired dimensions the front step is built into the platform, forming a well into which the doors fold and eliminating any outside folding step. This has necessitated the design of an unusual platform knee on the near side of the car. The knee bends inward toward the center line of the body from a point slightly inside the bulkhead and passes behind the step well, as shown in the accompanying drawing of the underframe.

The steps for the center-exit doors are similarly within the lines of the car body. A well has been made on each side 16 in. wide and 4 ft. 6 1/2 in. long. The center

cross sill is shortened and framed with steel channels running lengthwise between the adjacent cross sills. On each side of the car two strap brackets attached to the cross sills on each side of the center support the exit step. Feralun is used for all step treads and edges of the floor.

To secure the maximum seating capacity in a car of this type, an unusual arrangement has been adopted. There are twelve transverse seats in the center of the body, six on each side of the center exit; two longitudinal seats at each end inside of the bulkhead and a permanent seat on the left side of each platform. A folding seat of special design is used to cover the door openings not in use. This is a collapsible seat hinged in the middle and the two halves may be folded together until they meet. The seat may then be slipped down into a pocket, the process somewhat resembling that of slipping a book backward into a bookcase. This arrangement eliminates any chance of the seat falling down while a passenger is sitting on it because it is entirely independent of any supporting legs or similar device. Each car is equipped with four such seats, one for each center door and one for each platform door. When the car is in service the seats on the near side are collapsed and slipped back into their pockets, forming divisions in the center of the entrance and exit passageway and insuring a double stream of passengers. The seats on the far side are unfolded and put into service.

PREFERENCE FOR WOOD SEATS

An interesting investigation was made by the company before deciding upon the material of the seats. Officials made trips at various hours of the day to different parts of the system and inquired of passengers on the cars what kind of seats they preferred. It was rather expected that some type of covered seat would

A Feature of the Underframe Design Is the Platform Knee on the Near Side Which Passes Behind the Step Well

find considerable favor. It was thought also that the passengers would be likely to express preference for the particular kind of seat used in the car in which they were riding at the time the question was asked. But neither of these things occurred. The officials say that the passengers favored wooden slat seats. Inasmuch as the company has found this type of seat to be desirable, not only on account of the economy of maintenance but also on account of sanitation, it was entirely ready to accept such a verdict from the riding public and all of the new cars have cherry slat seats.

ORDER WAS SPLIT BETWEEN TWO PLANTS

Of the total number of cars being built, 100 are under construction at the Philadelphia plant of the J. G. Brill Company and 100 at the plant of the St. Louis Car Company. The cars built by the two different car builders are identical in construction. Duplicate prints of the same drawings were supplied to the car builders, cover-

with the car body, it can be easily and cheaply replaced after being damaged in an accident.

Of the cars 100 are equipped with four Westinghouse No. 510-A 35-hp. motors and the other 100 have General Electric No. 265 motors of the same capacity. The control is K-72-A for all of the cars. This controller differs only slightly from the well known K-35, but has two extra contacts at the bottom for use in connection with an electrically operated fare box. The control is interlocked with the line switch under the car. The motors are not interchangeable between the cars built at the different shops. Through the co-operation of the motor manufacturers, however, it has been possible to make the gears interchangeable between the two types of motors; that is to say, Westinghouse gears will work with General Electric motors, and vice versa.

Westinghouse variable load brakes are being used for the first time on surface cars in Greater New York. A spring-actuated valve controls the admission of air into

Left—To Attract Attention the Dashes of the New Cars Are Painted Peacock Blue with a Red and Yellow Cobweb Effect in the Center. Right—The Entrance Doors Open Inward into a Well. On the Opposite Side of the Platform Is a Permanent Seat

all details of the car. Both lots have Brill 77-E-1 trucks with 26-in. rolled steel wheels.

Although the cars are of steel construction throughout, the weight has been kept down below 37,500 lb. The side sheeting is 0.25 per cent copper bearing steel. The use of copper bearing steel in place of the ordinary metal adds approximately 15 per cent to the cost of the sheeting, but it is thought that rust-resisting material will have a longer life that will more than repay the greater initial outlay. Climatic conditions in Brooklyn are particularly difficult on account of the nearness of the ocean and the fogs which carry minute particles of salt. This results in considerable corrosion of ordinary steel. The only wood used in the car interior is that in the floor, seats, doors and sash.

The vestibule posts and vestibule carlins are of wood in contrast to the steel posts and carlins used elsewhere in the car. This arrangement has been made, as shown in the accompanying illustration of a partly completed car, so that in case of collision the whole frame will not be injured. The hood not being integral

the brake cylinder. The position of this valve is governed by a rod which extends from the variable load device to the truck bolster. A cam on the truck bolster is connected with the rod and on the truck transom below the cam is a knife-edge contact. The cam is not fixed rigidly to the truck bolster but is lowered into position only when air is admitted to the opening of the door engine. When the car is stopped and the door is opened this contact edge touches the cam. If the total weight of the car and its load varies as passengers board or alight the spring-actuated valve of the brake cylinder is reset in another position. By this means the amount of air admitted to the brake cylinder by the ordinary application of the brake handle is varied according to the weight of the car and its passenger load when the last stop was made. A braking efficiency of 100 per cent at all times is attained by this apparatus. The hand brakes on the new cars are of the Peacock staffless type.

Standard safety devices are installed on the new cars and electro-pneumatic control is used on the center

doors. These center doors are operated from the conductor's position by a push button. The door-operating mechanism is located above the doors, as shown in one of the accompanying illustrations, thus giving more floor space and insuring the apparatus against freezing in cold weather. The door-operating mechanism is manufactured by the Consolidated Car Heating Company. The front door is interlocked with and operated by the motorman's brake valve as usual with safety car equipment. All the doors are interlocked with a line switch to prevent the car starting before the doors are closed. A counter emf. relay is in circuit with the door control to prevent opening the doors when the car is traveling faster than a certain predetermined speed.

FARE BOXES ELECTRICALLY OPERATED

Johnson type J electric registering coin boxes are used, together with International R11 registers, solenoid-operated. This apparatus is described elsewhere in this issue of ELECTRIC RAILWAY JOURNAL. When the

which is described elsewhere in this issue, is used on the cars. It is similar to the ordinary type manufactured by the Ohio Brass Company, but has a novel lubricating device incorporated in its design.

An unusual feature of the arrangement of signs is that all of them are at the front end of the car. Hunter signs are used entirely. One is in the center of the letterboard above the middle front platform window, one is at the top of the near side platform window and a third is at the top of the first side window on the near side of the car. The other end of course duplicates this arrangement. The first and third of these signs indicate by name the route on which the car is running. Only the sign in the right hand platform window indicates the destination.

The general color scheme of the new car is the same as that which the Brooklyn City Railroad ordinarily uses, the base color being aurora red and the trimmings citron yellow. On account of the narrow streets in Brooklyn much trouble has been occasioned in the past by wagons scraping the paint on the sides of the cars.

Left—When the Car Is Operated by Two Men the Fare Box Rests on a Pedestal in the Center of the Aisle.
Right—The Steel Work Does Not Include the Hood. This Is Built of Wood for Greater Ease of Replacement if Damaged in Collision

car is in use with two men the fare box is located on a pedestal in the center of the car, but when it is being used as a one-man car the fare box will be moved to the motorman's end.

Mahogany finish is used for the interior woodwork and statuary bronze for the metallic trimmings. The cars are heated by Gold electric heaters controlled by Utility thermostatic heat regulators. The roof is of the arch type, equipped with twelve Utility honeycomb ventilators, and lined with white Agasote in one-half the cars and white Nevasplit in the other half.

Artificial illumination is supplied by two rows of small unshaded electric lights placed approximately over the center line of the cross seats. There has been in the past considerable trouble in Brooklyn from stealing of lamps and headlights. When designing the new car, therefore, particular attention was paid to this and a lock was selected which would prevent theft. General Electric lock sockets are used for the lamps. The lid of the headlight is of wire glass locked by a special eccentric key.

Hand straps are the same as used in the subway cars, porcelain enameled handles, Rico No. 5. Curtains are Pantasote. A new type of trolley catcher,

In order to avoid this each new car will be equipped with eight small guards. These are nothing more than vertical strips of pressed steel riveted at the four corners of the car body, and on both sides of each center door extending up to the belt rail. The strips project 1½ in. beyond the steel side sheets and it is expected that they will hold away any vehicle that may brush against the side of the car and prevent it from scratching the body paint.

NEW CAR TO BE ON DISPLAY

The first car to be delivered will be placed on public exhibition Nov. 1 on a siding near the Brooklyn Borough Hall. Alongside of it there will be one of the old horse cars used many years ago. Placards will draw the public's attention to the fact that the old horse car cost about \$650, whereas the new steel car cost approximately \$15,500. In spite of the greater cost of the modern car the fare is now 5 cents instead of 8 cents, which the horse car charged, and the haul for a single fare is considerably longer. The public is invited to inspect this car and familiarize itself with its novel features before the company places it in regular service.

Crane Car Built for General Utility Work

A Work Car, Rebuilt Into a Crane Car, Has Provisions for Hoisting, Transporting Heavy Loads and Supplying Compressed Air—Also Used as a Snow Plow

FOR handling and transporting heavy railway parts a crane car is the best equipment available. The addition of a few special devices makes the car useful for many other purposes, so that it can be kept in almost continuous service the year round. Such a car proves a real labor and time saver.

A double-end crane car combining many novel and useful features has been reconstructed by the Lehigh Valley Transit Company, Allentown, Pa., from an old work car that had a limited application. The cab of the original car was located in the center, and the framing was comparatively light.

In the rebuilding of the car the center cab was removed and placed at one end as a stationary cab, while at the other end of the car a revolving steel cab was built to house the control mechanism for operating the car and for a jib crane. The underframing also was strengthened by the addition of steel members placed to provide for the additional strain incident to the work for which the crane car is suited.

The crane has an 18-ft. boom, constructed of 8-in. channels with a connecting steel lacing. The total reach from the pivot to the hoisting cable is 22 ft. The boom has steel jaw bearings resting against a 3-in. pin which is welded to the rotating base. The boom is raised or lowered by a hand windlass to adjust the height. This height seldom needs to be changed, as the rotation of the cab and the backward and forward movement of the car itself provide sufficient adjustment for nearly all classes of work. The boom can be removed easily, and a covered pocket is provided in the car floor, so that the crane car can be converted into a double-end work car on short notice, with the boom concealed and out of the way.

The revolving cab is built entirely of steel, and all the main members, the center frame and the sheet steel sides are electrically welded, bolts being dispensed with except where removable pieces are required or provision has to be made for the substitution of repair parts. The cab and the frame supporting the boom revolve around a heavy center pedestal which is supported entirely from a steel pivot cap.

At a distance of 1 in. above the rotating base of the cab a stationary false floor is attached to the central pedestal. On this stationary floor are located the operating mechanisms, comprising the controller, air-brake valve, hand brake, whistle, air gage, sander and gong. The wiring, air pipes and hand-brake chain go through the center of the pedestal, which is hollow. The head-light equipment, lightning arrester, circuit breaker and electric tail lights are attached to the outside of the rotating cab, receiving power through a contact ring located in the roof.

The hoisting cable travels over a pulley located at the end of the boom and another pulley at the top of the cab, whence it goes through the hollow central pedestal to a pulley located underneath the floor and thence by a double cable to an Ingersoll-Rand 4,000-lb. air hoist. Three speeds and capacities of the hoist are available. By attaching the hoisting cable direct to the double cable,

Provision Is Made for Use as a Snow Plow in Severe Storms

the 4,000-lb. lift is obtained at normal speed of operation. By placing the cable around a pulley at this point and attaching one end of the hoisting cable to a fixed hook located on the bolster, a 2,000-lb. lift at high speed is obtained. By passing the end of the cable through a sheave at the hoisting end, and attaching this to a hook located on the boom, an 8,000-lb. low-speed hoist is obtained. The normal lift of the cable is 19 ft., making it possible to attach the hook to a heavy article 40 ft. from the center of the pedestal.

Rotation of the hoist and cab is obtained through the use of a cable passing around a 4-in. channel ring which is located underneath the cab. The cable leads through pulleys underneath the car to a second Ingersoll-Rand 4,000-lb. air hoist. One end of the cable is attached to one drum of the hoist and the other to the opposite drum, being connected so that one cable is winding while the other is unwinding.

The air hoists used for operating the crane are of the type usually employed for shop use on carriers or booms, and are controlled by means of chain pulls. These controls have been removed, and electrically operated air valves, such as are used in the Type HL electro-pneumatic control, have been substituted. There are three stations from which the hoists may be operated to raise or lower and rotate the boom. One is on the pedestal in the rotating cab, one is near the rear window in the stationary cab, and the third is on a cable which may be plugged into a receptacle located underneath the car sill. These controls are ordinary contact switches, similar to those used in the car signal system of this

The Position of the Boom Is Adjusted by Means of Air Hoists

company, each being built up of fiber with a small operating lever projecting, as described in the *ELECTRIC RAILWAY JOURNAL* for Sept. 1, 1923. Two switches, one for the hoist and the other for rotation, are provided at each operating station.

Before the hoist can be moved it is necessary to release the cab lock, which is operated from inside the cab. It is made up from 3-in. steel plate which drops between stops on the floor. When the lock is raised clear of the stops a contact is made completing the control valve circuit so that operation of the air-valve switches is possible.

In order to steady the car when extremely heavy hoisting is done, and where there is danger of the car overturning, an outrigger is provided. A 6-in. I-beam, 8 ft. in length, is located in a roller pocket beneath the car floor, and may be pulled out on either side of the car. Hinged to the end of this beam is a 4-in. x 4-in. wooden block which folds up when not in use, but which fits directly under the end of the I-beam when pulled out, thus providing a sturdy brace which steadies the entire car while hoisting.

For winter service plow noses can be attached at either end of the car. These noses are adjustable through the use of simple raising levers actuated by 10-in. brake cylinders, which are installed outside the cabs, gravity sufficing to lower them. It is necessary, of course, that the rotating cab be locked in its normal position when using the snow plow on that end. Drawheads of cast steel are welded to the snow noses, so that

there are no bolts or rivets in the drawhead. It is stated that these snow noses can be installed or removed within thirty minutes.

The air supply for brakes and hoists is obtained from a General Electric 130-A compressor, having a capacity of 50 cu.ft. per minute. Pipe attachments are provided so that pneumatic tie tampers or pneumatic concrete breakers can be operated from the supply of air provided by the car.

The main operating motors are controlled by K-28 controllers, with automatic reclosing line switches located beneath the car. An automatic cut-out is provided to prevent over-travel of the hoisting and rotating cables, shutting off the engines as the cables approach the limit of their movement.

For use at night, 94-watt portable incandescent headlights are installed on either side of each cab, and a five-light cluster, mounted on 3-in. fiber, is located at the end of the boom. The cluster is easily removable, and the fiber protects the boom from accidentally coming in contact with the trolley wire.

The trucks were designed and built in the company's Madison Street shops, and all castings were produced in the company's foundry except side frames and journal boxes. These have given good service for more than two years, having been installed before the conversion of the car.

The car was designed by M. C. Garlick, supervisor of the Easton division, and was constructed under the supervision of W. C. Klein, superintendent of equipment

The Readers' Forum

Interchangeability and Standardization

DEPARTMENT OF COMMERCE

OFFICE OF THE SECRETARY

WASHINGTON, Oct. 18, 1923.

To the Editors:

In the *ELECTRIC RAILWAY JOURNAL* for Sept. 29, 1923, we note on page 520 your most interesting article on "Interchangeability and Standardization." We are particularly impressed with your remarks on page 521, beginning, "Standards of the type discussed may be established for a great variety of parts" This prompts us to ask your opinion regarding the possible usefulness of this division to the car-building industry in bringing about a reduction in the present variety of sizes and dimensions of many of the items enumerated in this paragraph.

We have co-operated with many different groups in reducing variety and find that our procedure offers a relatively short and effective method for obtaining satisfactory results. This does not interfere with the work of other groups, but, in fact, clears the way so that their standardization work can be carried on more effectively.

The inclosed bulletins by the U. S. Chamber of Commerce, which body is co-operating with us, show some of the things which have been simplified under the procedure referred to.*

*In this bulletin, among a long list of similar accomplishments in various fields, there appears the following items: The number of varieties of steam railway car wheels required was reduced from 175 to 4; dry cells from 17 to 6; hammers, axes, etc., from 2,752 to 761; lamp bases from 179 to 6; paving brick from 65 to 7; tires from 287 to 32; wheelbarrows from 42 to 16, etc.

Our point of view is that many of the items in present use do not need to be superseded by new or radically different types as standards, but instead, that present production and use could be concentrated on those articles of proved greatest demand or usefulness and that the other items which are not in such universal favor can be dropped or discarded.

We would like to have your views on this preliminary phase of standardization as applying to this particular field.

DIVISION OF SIMPLIFIED PRACTICE,

BY R. M. HUDSON.

[The editors replied that they believe there is an opportunity for this division of the Department of Commerce to contribute a very helpful influence in the work already under way in the American Electric Railway Association which might result in a much quicker accomplishment of the desired end. The matter was referred to President H. A. Johnson and Executive Secretary J. W. Welsh of the American Electric Railway Engineering Association for consideration.]

The work of the Division of Simplified Practice is primarily to bring about a reduction of the great variety of types or styles of any article required by the trade. This is in the direction of standardization, though quite different from the program of standardization that has been followed by the A.E.R.E.A. It is distinctly a step toward securing greater interchangeability, which was one phase of the discussion in the article referred to in the Annual Convention Number. For example, if the thousand and one simple items on a car that are manufactured to perform a certain simple function, but are each made slightly different by each manufacturer, could all be manufactured to conform to a very few designs of each piece, what a help that would be to the railway company which has to stock spare parts for every design of every article used on all of its cars, in order to be prepared to make replacements.]

Equipment Maintenance Notes

Removing Wheels from Transfer Table Axles

BY H. COWEN

General Foreman New York Railways,
New York, N. Y.

WHERE electric railways shops are equipped with transfer tables, it is most important that they be maintained in proper repair at all times, in order to anticipate emergencies and prevent unexpected breakdowns. Renewals of motor equipment and control parts can readily be taken care of, but the replacement of broken wheels or axles usually is a very difficult proposition and one that consumes considerable time. In order to prevent tying up the transfer table over an extended period, some railways provide spare axles and wheels so that these may be inserted without delay.

The transfer table axles at the Fiftieth Street shop of the New York Railways were too long to be accommodated in the wheel press, and for many years wheels were removed and replaced by hand pumping. In this operation the cylinder, ram and yoke were removed from the hydraulic axle straightening press and an arrangement with two 1½-in. diameter tension rods fitted with end and intermediate tie yokes was used as shown in the accompanying diagram.

The hydraulic pressure used for removal of the wheels was provided by hand pumping, which constituted a part of the standard cylinder of the straightening press. When carried out by this means the job required four shop men and generally took from eight to ten hours to replace two wheels. The pressure used for pressing on was about 40 tons.

Not only did this method require an excessive amount of time, but it also proved very tedious and trying on the men, who considered it as a "man killer," but were loyal and conscientious enough to tackle it whenever occasion demanded.

In order to improve on this tedious method and to reduce the expense involved in performing the work, connection was made to a hydraulic plunger pump located near by. This pump was attached to a 250-ton wheel press and a connection was made between the pressure cylinder and this pump by a ½-in. pipe. The tie rods and separators were assembled in the same manner as previously used, but the electrically driven pump furnished the hydraulic pressure. As a result of this, the time for renewing two wheels was reduced to two hours, and two men could take care of the job without difficulty. The composite saving, therefore, amounted to thirty-six man hours, and in addition the men were not overtaxed and emergencies were promptly met as they arose in the transfer table operation.

Pipe Staff for Flag and Lantern Signal

BY CLIFFORD A. ELLIOTT

Engineering Department Pacific Electric
Railway, Los Angeles, Cal.

THE Pacific Electric Lines found it necessary to provide a standard staff for flag and lantern signals used as a protection during track repairs. The rules of the road require foremen to place proper protection signals in advance of any work being carried out. These signals consist of a yellow flag during daylight periods and a lantern at night.

The staff used for supporting these signals is made of ½-in. pipe with two tees, a nipple and a hook at the upper end. The upright is 4½ ft. long and is pointed at the bot-

Efficient Flag and Lantern Staff Used by
Track Department of Pacific
Electric Railway

Flag Signal in Position for Signaling Traffic

tom so that it can be readily placed in the ground. A reducing tee ¾ in. to ½ in. is screwed to the upright. The small end of the tee is bushed and a 1-in. iron hook is provided for hanging a lantern. A nipple is screwed into the ¾-in. end of the tee and another standard ½-in. tee is screwed to this. This latter tee forms the support for the flag. The tee for holding the flag is placed at an angle, as it was found that this was most suitable for giving trainmen an unobstructed view of the flag. An accompanying illustration shows a flag in position.

Grinding Air Compressor Cylinders

BY O. A. NORENE

Assistant Master Mechanic Omaha & Council Bluffs Street Railway

AIR compressor cylinders when badly worn or scored were formerly bored, bushed and reamed to standard size, a practice that was

Re-turning Tool for Truing Up Crankshaft

not very satisfactory. At present we are grinding worn cylinders and fitting them with oversize pistons. Two two-piece double-seal piston rings are fitted on each piston. Most of

our compressors are ground to 0.020 in. oversize.

Crankshafts are tested and bearing surfaces are trued up with a No. 1 Weber crank pin re-turning tool. With this type of tool, a crankshaft can be trued up in a very short time. Compressor suction line strainers are located inside of the car in one of the seat pedestals. This has eliminated, to a great extent, the collection of grit and dirt in the crank cases of compressors, which we were having when strainers were located underneath cars.

Level Board for Track

BY J. S. WILDER

Engineer Maintenance of Way, Municipal Railways, St. Petersburg, Fla.

THE ordinary track level board which can be bought ready made is often heavy, awkward to handle and sometimes inaccurate. A much more satisfactory one can be very cheaply made in the railway shop. A graduated level having a movable shield to protect the glass, such as

are to be found in machinists' iron levels, can be bought without the iron frame. By inserting a screw at each end of the level it can be very conveniently attached to a 5-ft. stick. A small square of sheet rubber packing is placed under each end and the screw passes through the center. This permits a slight adjustment to be made with a screwdriver.

The stick for the level board is made out of any convenient wood which does not warp too badly. A handy size is 1½ in. x 2½ in. x 5 ft. Both ends of the stick are shaped. It is planed to the desired size and laid out in the sun for a couple of days to season. If treated with oil it will warp less readily.

With such an apparatus, a difference of ¼ in. from level on track will show a movement as great as ½ in. in the glass. While such accuracy is hardly needed in ordinary work, nevertheless it is sometimes of great convenience. Moreover, the marking of the track gage on the stick often saves time in making measurements.

What They Saw at Atlantic City

*General Manager of Small City Railway Thinks \$500 Well Invested—
Representatives Present Preliminary Reports with
Practical Suggestions for Improvement*

"NOW while you fellows are drinking your coffee and lighting up the cigars which Charlie Riter is going to pass around, we'll get down to business, for I don't like these noon conferences to last too long." The speaker was William Redfield, general manager of the Jinxville Electric Railway, and the occasion was a luncheon meeting of his staff to listen to and discuss reports from the company's representatives at the Atlantic City convention of the electric railway associations.

"Sorry I couldn't go to Atlantic City this year. You know I was laid up with that lumbago I got the wet night we were out trying to get the crowds home safely after the county fair. John O'Neill and Bill Gainway made a good team, however, and we'll hear from them. You're first, John."

The superintendent of overhead, thus called upon, gave an account of the trip from Jinxville to the seashore and then said: "Of course I noted first the line materials. I was struck by the new things in overhead frogs. I think we can keep our trolley wheels on the wire better if we use up-to-date frogs with long approaches and no sharp angles. Then I learned a lot about automatic substations. I want to take up with you, Mr. Redfield, a plan for using one or two of them on our suburban lines. Tom Fairweather, our worthy roadmaster, would have been interested in a batch of broken rail joints that I saw; broken

in a testing machine. Tom, it's up to you to know what that committee on welded rail joints is doing. Your joints will stand a little improvement.

"Another thing that struck me, fellows, was the fact that we're going to get the Engineering Manual in bound form. Our loose-leaf copies are always incomplete and out of date. Maybe it's our fault, but that's the fact. One thing more before I sit down. While I don't know much about car equipment, I think these new door-operating outfits are great, and I was glad to see that treadle-operated door that we've read so much about lately. That's all I've got to say today."

"Good speech, Johnny," was the general remark as he sat down. Mr. Redfield then called on Gainway, asking him to be brief as O'Neill.

"I'll cut it short all right, Chief; don't worry," was the rejoinder from the burly superintendent of transportation. "I'll second all John says and more about the interesting things we heard and saw. I'm sorry the whole bunch couldn't have been there. It was great."

"Now for some things John left for me to say. Did anybody say 'buses'?" You ought to have seen 'em—buses everywhere. It seemed like a bus convention in many ways. We've got to have a few here, Mr. Redfield. I'm sure I can sell you the idea. But there was a lot for my department besides buses. Take accidents, for example. The claims fellows are getting their grip on this

thing and we operating men must co-operate with them. I heard a lot of good stuff about managing men, too. It all comes down, in my opinion, to treatin' 'em square. No coddlin', just a square deal. I noted that the claims agents and accountants are getting busy on ethics. It won't hurt any of us to be a little particular about such matters. Now when we get together again I want a little more time. I see the chairman winkin' at me so I'll sit down. No applause, please.

"Wait a minute, Mr. Redfield, one thing more. You know we talked about pull-ins, lately. Well, a chap from Memphis named McWhorter gave a report on that subject that struck me as a transportation man. It seems a lot of the master mechanics down South have a competition on pull-in records. They're getting great results. Wish we could get in on that."

"Well I'm glad we spent \$500 sending John and Bill to Atlantic City," said Redfield, rising. "It's a good investment. But if we are to make the most of it we must change our practice here and there as our new information shows that to be desirable. I want John and Bill to call attention to anything they see around here that does not come up to the standards of the Atlantic City convention. We'll make improvements as fast as we can afford to make them."

"The meeting's adjourned."

New Equipment Available

Fare Register and Coin Box Electrically Interlocked

ON THE new cars of the Brooklyn City Railroad, described elsewhere in this issue, fare collection will be accomplished by means of a Johnson type J coin box and an International R-11 solenoid-operated overhead register.

A fare box as shown in the accompanying illustration is mounted on a pedestal in the center of the car. The passenger deposits his fare in the slot where it drops by gravity into a position making an electrical contact which operates a magnet. When this magnet is energized, it lifts a plunger which closes a second electrical circuit connecting with the overhead register and pushes the coin onto an inspection tray. The register is mounted on the inside of the bulkhead and is the usual type of International register with a simple magnetic actuating device attached to the rear.

The box is designed to receive

An Electric Actuating Device Is Attached to the Rear of the Register

either nickels or dimes, registering one fare for a nickel and two fares for a dime. Double registration for a dime is accomplished by allowing it to drop into a second and lower position, where the circuit is again closed. The nickel, being larger, will not drop into the lower position, but passes immediately to the tray. In the side of the box is a glass window so that the conductor can tell at a glance what coin has been put in the box. After registration the coin drops into a return chute, where it is available to the conductor for making change. The apparatus is adapted for use where there is a straight 5-cent or a straight 10-cent fare, or where all fares are paid by the use of a token of some uniform size.

New Pump for Wheel Presses

A NEW pump has been developed by the Hydraulic Press Manufacturing Company, Mount Gilead, Ohio, for use with its wheel presses. Extreme rigidity, careful guiding of all reciprocating parts and provision to take up wear are features of this pump. Due to the reciprocating motion and the high speed at which pumps for hydraulic wheel presses operate, they are subject to more deterioration on account of wear than other parts of the machine. In the design of this new pump particular attention has been given to overcoming these difficulties.

The cylinder block for the three-plunger, high- and low-pressure type

of pump, is mounted on a casting which acts as a cover to the self-contained reservoir. This cover is provided with machined pads for the forged-steel cylinder block and the cast crosshead guide. The cylinder block is a one-piece steel forging with plunger and valve cavities bored out. Bronze seats are provided for the valves. The one-piece cast crosshead guide is provided with babbitted bearings. The crossheads are of large diameter so as to reduce the bearing pressures resulting from side thrust. Grease-cup lubrication and wedge-type brass adjustable take-ups are provided in the crossheads.

The Class "SS" pump is furnished in either two- or three-plunger types. With two plungers both are of the high-pressure type, while with the three-plunger construction, one low- and two high-pressure plungers are provided. Automatic knock-out or pump unloading valves of the spring-

Three-Plunger High and Low Pressure Type of Pump for Hydraulic Wheel Presses

loaded type are connected to the pressure chamber. The springs are set to balance at a predetermined hydrostatic pressure. When this is exceeded the springs compress and cause a system of levers to raise the suction checks from their seats, thus rendering the particular cylinder which they serve inoperative. This is accomplished automatically and permits the low-pressure part of the stroke to be accomplished at high speed with all the plungers of the pump operating. As the work in the press increases the pressure builds up the knock-out valve on the low-pressure cylinder and holds the

A Window in the Side Permits Conductor to Inspect the Money

check from its seat, rendering the cylinder inoperative during the balance of the high-pressure stroke. The high-pressure cylinders are also provided with knock-out valves which are adjustable and can be set to release at a predetermined pressure.

In addition to operating automatically the knock-out valves are provided with hand levers and they may be thrown out at the will of the operator. The hand levers do not effect the automatic operation of the knock-out valves. The Class "SS" pump is provided in four sizes, from $7\frac{1}{2}$ hp. to 15 hp.

New D.C. Control Relay

A MODIFICATION of the control relay known as the type S has been developed by the Westinghouse Electric & Manufacturing Company. Control relays are generally required for the closing-coil circuits of electrically operated air and oil circuit-breakers. The type S relay adds a trip free feature to the circuit-breaker control system, thus preventing the breaker from being held closed by the operator in case of a short circuit.

The type S control relay is provided with a two-piece contact arm and a release coil. As soon as the circuit-breaker is closed by the operator, the pallet switch on the breaker energizes the release coil of the control relay. The release coil opens the contacts of the control re-

Control Relay with Knife Panel Switch

lay, irrespective of the fact that the operator may hold the control switch in the "closed" position and thus still be energizing the main coil of the control relay. This arrangement requires that the operator return the control switch to the "off" position before he can again close the circuit-breaker.

All-Metal Railway Tie

AN ALL-METAL railway cross-tie with several new features is being placed on the market by the Metal Safety Railway Tie Company, Philadelphia, Pa. This tie is of a channel type made to standard dimensions. Its construction permits of

Section of Track with Metal Railway Ties

considerable flexibility, but is such that heavy tonnage thrusts and wheel shocks are received and absorbed.

Pockets are provided in the upright side of the tie to act as seats for the rail, which are held in position by wedges. Two semi-sleeve type wedges are used, one on either side of the rail at each pocket. When inserted they are driven home with a heavy maul. The rails are thus anchored to each tie and the wedges resist longitudinal and lateral thrusts. This method prevents widening of the gage and retains the rails firmly in a perpendicular position.

The metal safety ties can be applied to any size or section of rail and do not necessitate any departure from the rail or joint punching in use. At points where it is necessary to insulate the tracks for signal circuits this can be taken care of by using a fiber lining in the wedges.

A Self-Lubricating Trolley Catcher

DUE to its location on the dasher of a car, the trolley catcher is subjected to the most severe weather conditions. The construction must be more or less open in order that it may function properly, and this exposes the parts to the influence of snow, rain and dust. Adequate lubrication is therefore of great importance.

The Ohio Brass Company has recently improved the O.B. catcher by providing means for oiling all parts

with one application of oil through a single opening. This is done without removing or deranging any parts of the catcher or taking it off the dasher of the car. In the center of the new device there is a chamber packed with wool waste with outlets leading to the center stud and the throw-out dogs. It is necessary only to engage the reel latch with the reel and insert any ordinary oil through the opening in the cover thoroughly to saturate the wool waste. The rotation of the reel in its regular operation will then produce lubrication at every point where it is needed.

Another feature of this catcher is the positive protection against stepping-up. When the trolley wheel leaves the wire and the catcher is tripped, one of the dogs will slide over the guide, indicated by letters A-B in the accompanying illustration, and engage with stop C, preventing any further upward flight of the pole. Rebound of the pole cannot cause any stepping-up as it is necessary for the dog to back from B to A before it is released from the guide to assume its

In the Center of the Reel of This Trolley Catcher Is a Chamber Containing Oil-Saturated Waste

The Dog Does Not Release Until the Reel Is Turned Backward Nearly a Quarter Revolution

normal position. The guide is of sufficient length to permit taking in more of the rope than that which is released by the rebound effect.

The new Brooklyn cars described in this issue are equipped with these catchers.

New Type Grinders—Above, Bench Grinder.
Below, Floor Type

Improvements in Floor and Bench Grinders

SEVERAL new features have been introduced into the design of floor and bench grinders being marketed by the Hisey-Wolf Machine Company, Cincinnati, Ohio. The control of the operating motor is by a button located on a plate in front of the machine with the switch proper completely inclosed in the base. This mounting insures protection for the parts and gives ready access to the switch mechanism by removing the cover plate.

The end heads for the operating motor are cone shaped, which gives the maximum working space around the grinding wheels. Combination wheel guards are provided with removable end covers and exhaust pipe connections. They are adjustable to any angle and to provide for wheel wear. They are designed so that the wheels can be removed independently. The spacing between the two grinding wheels is made particularly large, so that two operators can work without interference.

Ball bearings are used throughout, and are mounted in motor end caps in close proximity to the grinding wheels. The bearings are completely inclosed from dust and dirt and provided with heavy felt washers on each side of the bearing housing.

Tool for Resizing Compressor Cylinders

THE National Brake Company, Buffalo, N. Y., is marketing a device for resizing compressor cylinders, which is called the Auto-Hone. This consists of a center arbor with honing stones mounted on its circumference. The position of the stones is adjustable, so they may be made to fit cylinders between 3½-in. and 4½-in. bores. Pressure on the stones is regulated from the driving end of the tool. To grind the cylinder the tool is slipped in and is then connected to an ordinary electric drill by a demountable driver. As the Auto-Hone revolves, the stones grind the walls to cylindrical shape. Two sets of stones are furnished, one for quick cutting and the other for fine honing. The stones are 8 in. long and bridge the area of wear so as to grind the full length of the cylinder. One set of stones will grind about 100 cylinders.

Device for Grinding Compressor Cylinders

New Railway Lightning Arrester

THE Electric Service Supplies Company has placed on the market a new type of direct-current railway lightning arrester, intended for both car and line service, and known as their type IC. These arresters have been designed to fill the demand for a highly efficient railway lightning arrester completely incased in porcelain.

Type IC arresters are entirely self-contained; that is, they do not require an external protecting box, and are so constructed as not to require or permit inspection. The maintenance

of the arresters is practically limited to the replacing of damaged units. From experience gained through the use of porcelain-incased arresters on power and lighting circuits of some of the larger central stations, indications are that the total annual maintenance costs may be kept well below 1 per cent of the original cost of installation.

The new arresters permit of easy and cheap installation and are small enough to be installed on the most crowded pole, or in any convenient location in a car.

These new arresters consist of a porcelain body, entirely sealed, which houses the operating mechanism. The arrester is of the spark-gap type, and for interrupting the flow of power current following the lightning discharge to ground, use is made of the long standard Garton-Daniels circuit breaker principle in a modified form. In this new arrester a permanent discharge path is provided from line to ground. The circuit breaker path is normally open and forms a shunt to a portion of the discharge path. The power current following a discharge to ground closes this circuit breaker path, transfers the dynamic current flow from the discharge path to the circuit breaker path, de-energizes the solenoid-operating coil and permits the circuit breaker to cut off the flow of power current to ground.

Due to this particular construction it has been possible to secure a very compact unit and one whose efficiency

Spark-Gap Self-Contained Type of Lightning Arrester

is high. The same arrester is used for both car and line service, different hangers only being provided for the two conditions. The arrester being entirely self-contained enables one to tell at a glance whether it is in good condition or not.

American Association News

Exhibits Finest and Largest Ever Displayed

Many New Devices Were Shown—Something of Interest for Each Department of the Electric Railway—Space Devoted to Buses Was 24 per Cent of the Total

THE display by manufacturers at the forty-second annual convention of the American Electric Railway Association surpassed all previous records. A total of 167 exhibitors had displays, which occupied 75,930 sq.ft. of space. Of this amount 374 sq.ft. was outside the pier in various track exhibits.

A particularly noteworthy feature of the display was the large amount of space devoted to bus exhibits and accessories, which consumed 24 per cent of the space. At last year's convention in Chicago, out of a total of 62,000 sq.ft., 11 per cent was taken by bus exhibits. This year's record for space taken by bus companies is thus three times that of the Chicago displays.

There have been very interesting exhibits at the association conventions in the past, but none, in the opinion of those in attendance, where more new developments were shown. There was something instructive for each department of the electric railway.

AUTOMATIC SUBSTATION AND REMOTE CONTROL DEVELOPMENTS

Power men found much of interest in the developments shown in apparatus for automatic substation and remote feeder control. New apparatus showed the adaptation for this service of electro-pneumatic contactors of standard types used in electric railway service for starting and running synchronous converters. Small synchronous converters with high-reluctance interpoles can be started successfully without raising the brushes from the commutator and the automatic control for such machines is simplified thereby. Other interesting developments included a pneumatic mechanism for closing oil-circuit breakers, supervisory control for switching equipment of all kinds at remote points and remote load indicating devices for transmitting meter indications over two-wire telephone circuits or their equivalent.

Way and track men found much of interest in a large variety of track-work, tie and welding exhibits. The association's exhibit showing samples of various welded rail joints tested to destruction, together with photographs showing the methods used in making the test joints, received considerable attention. New designs for frogs and switches showed the attention that is being given toward developing track-work that will give longer life with less trouble in service. There were a large number of exhibits of metal and substitute ties for both open and closed tracks. The new types showed that

much attention is being given toward producing a satisfactory substitute tie. Welding displays were more elaborate than ever before and several new track grinders were shown.

The increased use of cars operated by one man has resulted in improvements in overhead construction to prevent trolley wheels from leaving the wire. Several new designs of overhead frogs were shown. A universal frog with overlapping runners has been brought out which prevents the flanges of trolley wheels from running on the pan.

Improvements in fare collection and registering devices have also been influenced by one-man operation of cars. New designs show a trend toward instantaneous registration, more rapid operation, reduction in weight and simplification of mechanism to relieve operator of duties.

Equipment for controlling and operating doors and steps also showed considerable advancement. Operation has been simplified to reduce trouble and save time. Special consideration has been given to preventing accidents. Thus in one new design shown the failure of the air supply or an open circuit in the electrical circuit closes the door automatically.

Other parts of car equipment showed interesting improvements. A new light-weight control equipment was shown for the first time and a fan ventilation attachment for application to old motors was said to make it possible to increase their capacity 36 per cent.

There were many developments in electric heaters and thermostatic control equipment. New heating elements imbedded in insulating material permit of many new designs of heaters such as the floor type, which was exhibited. The use of high-grade resistance wire is quite general and permits new types of construction of other parts.

EQUIPMENT FOR THE ACCOUNTANTS SHOWN FOR FIRST TIME

The accounting and auditing departments of the railways, found much to interest them this year in the large number of exhibits containing new coin counting and wrapping machines, also improved calculating and listing machines.

Exhibits outside the pier included an electric trolley bus and two electric locomotives. The trolley bus was one of those purchased for use on Staten Island, N. Y. One of the electric locomotives was for service on the Glendale & Montrose Railway. This locomotive

weighed 99,000 lb., had a total wheel-base of 22 ft. 6 in. and was provided with 36-in. diameter wheels and 5 x 9-in. journals.

STATISTICS ON BUS EXHIBITS

There was a total of twenty-six gasoline-driven motor buses and one electric trolley bus shown. Of the twenty-six gasoline-driven buses, seventeen were of the street car type, six were of the sedan or limousine type, three were double deckers and one was of observation type. The street car types seat from sixteen to twenty-nine passengers on a single deck, while the intercity coaches accommodate from seventeen to twenty-four passengers. The double deckers carry from fifty-one to sixty-seven. Five of the limousines had smoking compartments that accommodate from six to eight persons.

For the most part, the street car types were finished with leather seats, only six having rattan, which is the popular choice on the three double deckers shown. Seven of the buses and chassis on exhibition had air brakes, in one case on all four wheels. Pneumatic tires in sizes ranging from 32 x 6 to 36 x 6 seem to be most favored with dual rears. The doughnut type of tire with 20-in. wheels was found in one exhibit.

Prices f.o.b. factory for the city type buses exhibited ranged from \$2,400 to \$8,000. For the long-distance intercity buses with smoking compartments the cost is higher, in fact the range is from \$7,000 to \$10,000. The double-deck buses exhibited cost approximately \$9,000.

Special Reports Available

The Bureau of Information and Service of the American Electric Railway Association states that the following special reports have been prepared and are available to member companies in good standing upon request:

Wage Bulletin No. 128—For each of nearly 400 companies there is shown the rate of wages in effect Oct. 1, 1923, the date the rate became effective, the date of expiration, the average weekly wage earned under this rate, bonuses paid, previous rate of wages and the effective date, the union status of the trainmen and the wages of bus operators where the company operates buses.

Effect of Fare Changes on Revenues and Riding Habit—A group of companies having two or more fare changes has been selected and for each company there is shown the cash fare, ticket rate and transfer charge, if any, and a month by month statement of the number of cash passengers and ticket passengers, and the passenger revenue divided between revenue from cash fares and revenues from ticket sales.

The Weekly Pass—Gives a list of companies using the weekly pass with the effective date and the rate at which the pass is sold, together with figures showing the number of passes sold per year, the average number of rides on each pass, the average fare per passenger before and after the pass was introduced, the methods of introducing the pass and statement of the company's views as to the advantages and disadvantages of the pass.

The Indeterminate Permit—Contains copies of state laws providing for indeterminate permit, endorsements of it by public bodies and numerous public statements and arguments in favor of the general use of this type of franchise.

In addition to the above supplements to the Fare Bulletin and Cost of Living Studies have been prepared bringing this information down to date.

The News of the Industry

Thompson Policy Reversed

Chicago Is \$8,189,128 Richer Under the Policy of Conciliation of New City Administration

The City Council of Chicago on Oct. 17 voted unanimously to repeal the 1921 ordinance forfeiting the franchise of the Chicago Surface Lines. At the same time it approved the abandonment of pending forfeiture suits, voted to accept the city's share of the companies' profits, aggregating more than \$8,000,000, and paved the way for immediate service improvements even while negotiations are under way to bring about municipal ownership of the traction system.

All these things were done on the recommendation of Mayor Dever. In other words, the City Council has reversed the attitude toward the company taken during the administration of former Mayor Thompson, who kept the traction question an issue in political campaigns.

After rising operating costs had made it necessary for the state regulatory commission to increase the fare in Chicago above 5 cents, Thompson insisted that the Chicago Surface Lines had broken its contract with the city, and the City Council, at his request, passed a measure forfeiting the 1907 franchise ordinance, under which the companies operate. The city law department also filed forfeiture suits against the traction lines and the city administration refused to accept the city's 55 per cent of the companies' net receipts since 1920, on the theory that it would prejudice the settlement of the forfeiture suits.

The city's share of the companies' profits which have been offered each year, but not accepted, now aggregate \$8,189,128. If this amount had been accepted the city's traction fund would now total more than \$36,627,000. By the Thompson administration's refusal to accept this money it is estimated the city lost \$650,000 in interest.

Mayor Dever, in his message to the City Council, which resulted in tossing the policies of the former administration overboard, called attention to the fact that negotiations had been opened between the city authorities and officials of the Chicago Surface Lines looking to the purchase of the system by the city. He added that officials of the elevated lines are out of the city, but that conferences will be held with them in the near future, for the same purpose.

Mayor Dever said:

I respectfully request that you pass at once the ordinance recommended by the local transportation committee, repealing

the so-called forfeiture ordinance of Feb. 4, 1921, and directing the corporation counsel and the special traction counsels, which I transmit herewith.

I concur in their conclusions that the results of the suit and ordinances have been detrimental to the best interests of the city and beneficial only to the surface line companies.

The policy pursued resulted in the city's refusing to accept since 1920 the city's 55 per cent of the divisible net receipts of the Surface Lines, amounting now to \$8,189,128.

The institution and pendency of this suit have for the last four years obscured vital phases of the local transportation problem.

Based as it was on an erroneous theory, it has held false hopes impossible of realization, and at the same time has paralyzed all constructive efforts by the city to compel the companies to live up to their obligations under the ordinance.

Each time it was proposed by the City Council to take affirmative steps to procure performance by the company of its ordinance obligations to give better service or construct further tracks it was met with the objection that such action must not be taken because it would be inconsistent with and interfere with the prosecution of the forfeiture suit. In this way the companies got all the advantages of their franchises, because action by the city was suspended; they were relieved of their obligations under the ordinance.

With the forfeiture suit and ordinance out of the way, the city again will be in position to demand and enforce a complete compliance with those provisions of the ordinance, which under the decisions of our Supreme Court are binding upon the companies and enforceable by the city.

If then the companies fail to comply with those terms of the ordinance and thereby commit substantial breaches of their obligations, the city will be able to declare a real forfeiture and to institute proper suits to bring about a cancellation of the companies' rights.

The Mayor's legal advisers also recommended that the city appoint its representatives on the two boards of supervising engineers, who oversee the operation of the traction lines.

How the New Award Works Out in Boston

As was announced in the *ELECTRIC RAILWAY JOURNAL*, issue of Oct. 20, a wage increase of 9 cents an hour was recently awarded the 7,500 employees of the Boston Elevated Railway. How the award actually works out in cents per hour for surface line men and rapid transit employees is shown in the accompanying table.

Surface lines, motormen and conductors:

First three months of service.....	57
Next nine months of service.....	63
Thereafter.....	70

Rapid transit lines, motormen:

First year of service.....	71
Thereafter.....	72

Rapid transit lines guards:

First three months of service.....	57
Next nine months of service.....	63
Thereafter.....	70

One-man car operators and bus drivers—8 cents per hour in addition to regular rate. Snow work—Time held or worked.

Conductors, motormen or guards, 20 cents per hour in addition to regular rates.

Conductors, motormen, guards, gatemen, collectors, train clerks when instructing learners, 12½ cents per hour in addition to regular rate.

Settlement Plan Suggested

Ten-Cent Fare and Relief from Paving Burden Are Being Sought by Davenport Road

A comprehensive plan for rehabilitating the railway system of Davenport as a successful and continuing business has been proposed to the City Council by B. J. Denman, president of the Tri-city Railway of Iowa.

A 10-cent fare, a new car rerouting system, permission to operate single-truck cars on some lines, abandonment of some trackage, a lower revaluation of traction line property, backing by the city of a bill in the Legislature to give special chartered cities power to fix paving assessments on railway lines are the main points in this plan.

The increased fare would result in an increase in revenue of \$109,299 annually, Mr. Denman estimates. The elimination of trackage would reduce operating expenses \$50,000. The nub of the whole matter, however, is the burden of paving cost, now assessed against the company by state law. Under this law the company is compelled to pay the entire cost of paving between its rails and 1 ft. on either side. It is proposed to introduce a bill in the Iowa Legislature allowing special chartered cities, among them Davenport, to meet the cost of paving as they shall see fit. If this bill passes it will be understood that the Davenport City Council makes an equitable adjustment with the traction lines on paving. The suggestion has been made that the company pay for the foundation under its tracks and the city meet the cost of surface paving entirely, either by tax on abutting property or partly from a general fund.

The rerouting system asked was turned down by the City Council some time ago. It provides for the elimination of approximately 5 miles of track, a large increase in service, building of passing tracks, a generally faster schedule and an expense of approximately \$400,000 to the company.

It is also proposed that the assessed valuation of \$2,000,000 be reduced and the value of the property be more nearly based in its ability to earn. The Council has not the authority to make this reduction, but it could assist when the proper time comes, Mr. Denman states.

The Council received the communication and a special committee consisting of the standing committee on transportation, the Alderman-at-large, the Mayor and the city attorney was appointed to handle the problem.

The company, through Mr. Denman,

had stated some weeks ago that unless financial relief were granted operation of the railway would cease. Prominent business men, Councilmen, the daily press and labor organizations clearly indicated that street cars are wanted and that concessions must be made to keep the system in operation.

The daily press, in commenting on this latest plan of the company, suggests that it is the basis of a constructive solution of the railway problem and that the traction lines and the Council should be able to come to an understanding that will remove the existing drawbacks to successful operation and provide for operation, adequate to the city and profitable for the company. The press, however, suggests a lower fare than 10 cents for habitual riders. The present fare is 8 cents.

Mr. Denman's letter to the Council contains an estimate of operation under the conditions outlined in his request. He says that it should not be overlooked that the riding is continually decreasing, due to the increasing use of the automobile. The expressed belief of the company is that its traffic will decrease 10 per cent with a 10-cent fare, due in slight measure to the increase in fare, but in greater measure to the increasing use of the automobile. Assuming, however, that there is a decrease of 7 per cent in the traffic, it is estimated a 10-cent fare would produce an increase in revenue of \$109,299. This is arrived at by applying the proposed fare to the number of passengers in each class carried, and the increase in revenue arrived at as indicated in detail in one of the exhibits attached to the application.

Mr. Denman says that it will be some time before the operating economies mentioned in the application can be effected, and until that time the new fare would give the following results:

Annual revenue as shown in Exhibit	
D	\$856,176
Less operating expenses, taxes and depreciation	706,307
Net return on investment	149,868

According to Mr. Denman, this gives a return on the valuation of Burns & McDonnell of 1920 (not including construction since that date) of 4.61 per cent. It should not be overlooked that operating expenses for the past twelve months include an increased wage to train and shop men since June 1. He says that had the new wage been in effect the previous nine months, expenses would have been increased and the net revenue decreased by that amount. When the operating economies previously mentioned are in force, it is estimated that a saving of \$50,000 per annum will be effected, thus making the total net earnings available for return \$199,868, or 6.14 per cent on the valuation of Burns & McDonnell.

During the past six years the company scarcely made operating expenses, and it was impossible to maintain the property adequately. It is explained that this relates particularly to the overhead work and that it is necessary to spend at least \$50,000 to put the

poles and trolley wires in proper condition. This will be an additional item in operating expenses, not taken into account in the discussion. Mr. Denman says that a great deal of this work will have to be done within the next twelve months and practically all of it within the next eighteen months. He assures the Mayor and the members of the Council of the sincere desire of the company to be of every possible assistance to enable them to check the correctness of the figures presented by the company.

Injunction and Damages Sought by Maumee Valley

Precedent may be established in Ohio when the Common Pleas Court at Toledo makes a decision on the petition of the Maumee Valley Railroad seeking to enjoin the Ohio-Michigan Coach Line from operating a parallel bus service without a certificate of convenience and necessity from the State Public Utilities Commission. The plaintiff claims the operation of the bus line is "unlawful competition" because other provisions of the new state bus regulatory law have not been complied with by the bus company.

The railroad recently spent \$500,000 in providing new cars and equipment and speeding up service for the communities served.

In addition to the injunction the railroad seeks an award for damages it has suffered while the buses have been operating.

The court has taken the matter under advisement following a recent hearing on the petition.

Wage Settlement Reached in Springfield, Ohio

An increase of 3 cents an hour was granted platform men of the Springfield Railway, Springfield, Ohio, under the terms of a new scale after negotiations extending over a period of six weeks. The new scale, retroactive to Oct. 1, provides for 45 cents for the first three months, 47 cents for the next nine months and 49 cents thereafter.

The new scale represents a compromise offer by the company, the second to be made by it during the negotiations. The first compromise proposed a scale of 44, 46 and 48 cents. The carmen had demanded 46, 48 and 50 cents. The former scale was 42, 44 and 46 cents.

The company threw its books open for inspection by a committee from the union and made a second compromise offer, which was accepted. Some slight changes were made in the working conditions, one of these being the agreement by the company to supply tickets to the conductors and to collect for them at the end of the day. Heretofore, the conductors have been required to pay cash in advance for tickets. The conductors will still carry their own change. The scale continues the nine and one-half hour day basis on a seven-day week.

No Inequality to Seattle Rainier Charge

The State Department of Public Works has found that since the Seattle 8½-cent carfare there is no inequality to the same charge by the Rainier Valley line. Walter B. Beals, assistant corporation counsel, who represented the city of Seattle at the hearing, said that although the complaint had been dismissed, most of the petitioners' grievances had been righted by the company on its own initiative since the hearing before the department handed down its ruling. He cited the granting of school fares for children at ten tokens for 25 cents, the same rate charged by the Seattle Municipal Railway; abolition of the transfer charge, under which patrons formerly paid 10 cents if they wished a transfer to the Municipal Railway, and the company's concession by which patrons can buy three tokens for 25 cents instead of buying 50 cents worth at one time. The department, tentatively accepting the company's valuation and operating costs, found that it was getting a return of 4.72 per cent, after the president's salary had been listed at \$3,000. It commented on the non-resident president, pointing out that he lived in the East and acted as financial agent for the company, as well as for several other firms, and spent only two or three weeks in Seattle every year.

Service Restored in Milan

The Milan, Ill., tangle, involving a proposed new franchise for the operation of cars of the Tri-City Railway and the extension of the company's service, curtailed early in the summer by the hard road construction work, was adjusted at a conference between T. C. Roderick, general manager of the railway, and a special committee from the Milan town board, headed by Mayor B. H. Rollis. Under the agreement reached the railway will be completed in a short time and service restored to the Milan residents. The new route will cut off three blocks of the old car line routing. The franchise of the Tri-City Railway to operate cars in that village expired on Aug. 28 and up until the settlement the company had not indicated that it wished to resume service through the city.

Railway Troubles Discussed.—A public meeting was held recently in Anderson, S. C., at which the entire railway situation was gone into in an effort to devise some means to lighten the burden on the Southern Public Utilities Company. Efforts are being made to avert, if possible, the threatened suspension of service. It was brought out that revenue from street car service is not now sufficient to pay for operation, to say nothing of interest on bonds, taxes, depreciation, etc. No definite plan to aid the company to keep the system in operation was decided upon, but it was intimated that Council might relieve it of a part of its tax burdens and of its street paving assessments.

No Agreement in Cincinnati Over Replacement Expenses

At a recent meeting of the directors of the Cincinnati Street Railway no agreement was reached in the controversy between the company and the Cincinnati Traction Company over \$4,000,000 of repairs and replacements to the street railway system. Several members insisted that the arbitration procedure be abandoned and that the controversy be taken into the courts for immediate settlement. Another group contended that if the differences between the two companies could be settled by arbitration that was the proper course to take. It was said that any settlement made would be with a view of eventually returning the traction properties to the Cincinnati Street Railway, which leased it to the traction company in 1896 for a period of fifty years. It is understood that the lessor company would eagerly take back the system, but not in its present condition.

The directors of the Cincinnati Street Railway have intimated that the necessary repairs and replacements as outlined in the report of Stone & Webster, engineers, who made a survey of the traction properties, would have to be made or the amount necessary to make these improvements deducted from the selling price before it would consider any proposition. The Cincinnati Traction Company, on the other hand, is willing to surrender its lease, but under no circumstances will it sell at a sacrifice price. The Cincinnati Traction contends that it has expended approximately \$13,000,000 in repairs and betterments to the traction system since it took it over and that this amount must be taken into consideration. On the other hand, the Cincinnati Street Railway charges the lessee is in default of the covenants of the lease to the extent of \$4,000,000.

Magazine Articles Helpful to Railway Men

Forbes for Oct. 13 might almost be called an electric railway issue. In it are told "How the North Shore Line Set Out for a Goal and Made It," by Neil M. Clark; "How Paul Shoup Made His Mark," by B. C. Forbes, and the story of "A Merit and Bonus System that Rewards and Fires," by Charles Alma Byers. On the cover is a full-length half tone of Britton I. Budd, the president of the North Shore. All of the articles are illustrated, the pictures including portraits of Mr. Shoup and of George Baker Anderson, originator of the merit and bonus system of the Los Angeles Railway and manager of transportation of that company. To readers of the *ELECTRIC RAILWAY JOURNAL* the personal accomplishments of these men and their achievements for the companies with which they are connected are pretty well known; but all of the stories, written by men trained in the school of popular magazine

work, are most helpful to the railway man, in that the authors have unconsciously reflected in their stories the viewpoint of the general public about railway matters.

Will Extend Chicago "L"

Plans have been formulated for an extension to the Northwestern branch of the Chicago "L" system at Howard Street and a company has been organized to prepare the right-of-way. This new organization, to be known as the Chicago, North Shore & Northern Railroad, after construction is completed, will enter into an agreement with the Chicago Elevated whereby it will be possible for the Elevated to operate its cars over this new company's right-of-way. The proposed trackage will start at Howard Street, or the city limits, from whence it will proceed directly west 3 miles to Cicero Avenue, and then turn north and proceed 2½ miles to Dempster Street, Evanston. Stations at appropriate locations will be constructed along the line, while terminal facilities and yards will be provided at the Evanston-Dempster Street end. The construction will include submerged right-of-way and elevated structure wherever necessary.

Future plans call for a connection between the Dempster Street terminal and the Chicago, North Shore & Milwaukee Railroad's right-of-way at North Chicago. Such construction would make possible the operation of the present North Shore's Chicago to Milwaukee electric trains over a private right-of-way which skirts the numerous municipalities located between Chicago and North Chicago. This would cut down considerably the running time for the North Shore "De Luxe" through trains.

Special Permit Granted.—The Rockford & Interurban Railway, Rockford, Ill., has been granted a special permit to operate cars for a period of ninety days after Oct. 3, when the franchise expired. Negotiations for a new franchise are now under way.

Signs Taraval Line Bill.—Following a conference with President T. A. Reardon of the Board of Works, Mayor Rolph of San Francisco has ordered through service on the San Francisco Municipal Railway from the Parkside to the ferries. The service is to be put into effect right away. The Mayor said that the development of the district served by the Taraval line would increase the assessment of San Francisco and for that reason he believed the best interests of the city were served by this extension of service.

Engineer Reports on Washington-Baltimore Road.—A report on the financial operation of the Washington, Baltimore & Annapolis Electric Railroad and the Annapolis & Chesapeake Bay Power Company, covering the years 1911 to 1922, has just been issued by J. A. W. Inglehart & Company, Baltimore. This report, which was

prepared by W. T. Ballard, states that the physical properties were found to be in good condition, and while it is not possible that they will ever have a spectacular growth, their progress promises to be constant. The earnings of both companies have been fully sufficient over a period of years to protect interest requirements on the bonded indebtedness.

May Nullify Franchise.—At a recent meeting of the City Council of Milwaukee the company was charged with violating its promises by permitting the freight and baggage interurban cars to be operated over the streets in West Allis. The Council approved taking measures to nullify the present franchise, granted the company several years ago. The controversy, it is said, is an outgrowth of the track removal question which has been a matter of discussion for some time. The plan of the city is to have the company move the tracks on Burnham Street from the north side to the center of the road at the company's expense. The failure of the company to make this removal may result in the halting of service.

People to Decide Trolley Fate.—At a recent meeting of the committee of the whole of the Board of Estimate of New York, Borough President Connolly, discussing the operation of the New York & North Shore Railway, said that the residents of Flushing, Whitestone, Bay-side, Douglaston and Little Neck, Long Island, would be questioned soon on their desires with respect to the operation of the line. He said that the matter would be determined definitely by a questionnaire which would be sent out by the borough. At the meeting at which the city operation of the line was considered Grover Whalen, Commissioner of Plant and Structures, gave his opinion as to the trolley line, as compared with the bus line, saying that a modern bus line owned and operated by the city would be preferable.

Safety Behind Refusal to Operate.—General Manager Clinton E. Morgan, in emphatically refusing to continue bridge operations when the city starts the municipal lines on the Williamsburg Bridge, contends that safety of operation is the motive behind his refusal. He points out that while the bridge is not used now to the point of saturation, another line, of the type Mr. Whalen proposes, would crowd the private cars off. He said his company wants to give all the service possible and to make the service satisfactory, but it wants to continue to be a safe service. The franchises of the Brooklyn City Railroad and the Brooklyn-Manhattan Transit Corporation do not require bridge operation, and since the city owns the bridge the commission cannot stop it from running cars on it. The city has had tied up in equipment for three years the sum of \$600,000. In addition there has been a loss to the city of 5 per cent interest for three years on this sum, making the total amount of money lying idle for three years \$690,000.

Financial and Corporate

Paris Expenses Exceed Receipts

With Its Subsidy, the Company Earns Profits and Pays 8½ per Cent on Its Capital Stock

All of the public transportation in Paris is conducted by the Société des Transports en Common de la Région Parisienne, which operates not only all of the tramways and buses, but one short suburban steam line and passenger boats on the Seine. On Dec. 31, 1922, the company operated on its electric tramways 1,818 electric motor cars and 861 trail cars; on its steam lines, nineteen locomotives, thirty-four passenger cars, ten baggage cars and 122 freight cars; on its bus lines 1,115 motor buses, and on its boat system, fifty-six motor passenger boats, two tugs and sixty-eight towboats. The annual report of the company for 1922, submitted June 26, 1923, indicated that

PARIS TRAMWAY FARES IN CENTIMES

	First Class	Second Class
For the first zone	35 to 40	25
For two zones	55	40
For each succeeding zone after two	15	10

PROFIT AND LOSS ACCOUNT

Receipts of company (based on Article 23 of the franchise)	
Interest at 6 per cent on the capital stock of Fr. 60,000,000	Fr. 3,600,000.00
Premium earned by managing bonus	2,425,158.09
Premium earned by economy bonus	3,166,177.39
	Fr. 9,191,335.48
The expenses chargeable to the company are fixed, according to Article 23 of the franchise.

on Jan. 1, 1923, the company had under course of construction to supplement this equipment sixty-seven electric motor cars of standard design and 250 light-weight motor cars, eighty-eight motor buses with four wheels and fifty motor buses with six wheels each, eight

additional passenger boats and fifteen towboats.

Receipts from operation during 1922 amounted to nearly \$21,000,000. Of this sum the electric cars brought in nearly 63 per cent and the motor buses nearly 35 per cent, leaving about 1 per cent for the steam railroad and boats combined and 1 per cent for miscellaneous operating revenue. During 1922 there was an increase of 5.1 per

OPERATING STATISTICS, PARIS TRAMWAY, OMNIBUS AND BOAT SYSTEM, FOR 1922

	Vehicle-Miles or Boat-Miles	Passengers	Total Receipts	Receipts in Cents per Vehicle-Mile
Tramways (Electric)	56,715,777	622,405,302	\$13,348,512	23.4
(Steam)	669,707	1,780,563	74,865	1.1
Total for tramways	57,385,485	624,185,865	\$13,348,512	23.3
Omnibuses, regular service	26,941,282	289,937,863	7,275,548	27.0
Special night service	63,794	206,579	21,557	33.8
Special theater service	1,267	1,705	179	14.0
Total for omnibuses	27,006,344	290,146,147	\$7,297,284	27.0
Boats	356,283	3,391,311	143,423	40.3
Miscellaneous receipts from operation, such as excess charges, adjustments, etc.			9,780	...
Total			\$20,799,000	...
Receipts for freight and miscellaneous transportation			195,335	...
Grand total	84,748,112	917,723,323	\$20,993,335	24.8

cent in passengers carried and of 10.8 per cent in operating revenue, as compared with 1921.

As has been described in previous issues, the company has a contract with the Department of the Seine, in which Paris is located, by which it operates these various means of transport under the direction of the department authorities. For this service it receives compensation, whether or not the operation of the system as a whole is profitable, and this compensation includes two premiums, known as the managing premium and the economy premium, varying in amount with the financial results obtained. As a net result the company earned a profit for the year, although the operating expenses exceeded the gross receipts. The accompanying tables are for the year ended Dec. 31, 1922.

There have been two increases in fare since Feb. 18, 1919. One was on April 1, 1920, the other on Jan. 19, 1922. Fares are on the zone basis, and

the present tramway fares, expressed in centimes, are given in the accompanying table. One hundred centimes make a franc, and the rate of exchange for a franc has been assumed in this article as 7 cents. In the table of operating statistics below, the figures have been changed to miles and dollars. The other tables give francs.

Way Being Cleared for Kansas City Reorganization

A payment of claims aggregating \$125,000 against the Metropolitan Street Railway by the Kansas City Railways has been authorized by Judge Kimbrough Stone of the Federal court.

This is the first blanket order for payment of claims which has been made. It is taken to mean that the receivers have accumulated surplus funds and that a reorganization may be effected soon. The company will pay 80 per cent of the claims of certificate holders against the old Metropolitan Street Railway.

Judge Stone postponed the hearing on other priority claims against the company until Nov. 15.

In the meantime, claimants could perfect an organization among themselves.

James E. Goodrich, attorney for the company, admitted that the note and bond holders of the company had discussed reorganization at a meeting in Chicago.

The bondholders maintain their claims should be settled first, while the personal injury claimants are fighting for priority of payment. Judge Stone gave claimants who had not yet appeared in court ten days to obtain judgments or go to trial.

DISPOSITION OF CREDIT BALANCE

Credit balance	Fr. 5,967,611.81
5 per cent to legal reserve	Fr. 298,380.59
6 per cent interest on the capital stock	3,600,000.00
	3,898,380.59
Balance after these payments	Fr. 2,069,231.22
15 per cent of this balance to board of directors, according to Article 43	Fr. 310,384.68
2 per cent extra dividend on capital stock	1,200,000.00
	1,510,384.68
Balance after these payments	Fr. 558,846.54
One-half to Department of Seine (according to Article 23)	279,423.27
Balance after this payment	Fr. 279,423.27
Surplus from 1921	29,664.59
Total	Fr. 309,087.86
4 per cent extra dividend on capital stock	300,000.00
Balance carried over to next year	Fr. 9,087.86
It will be seen that each share of capital stock received an interest payment of 6 per cent and a dividend payment of 2½ per cent.	

OPERATING REPORT FOR 1922

Passenger operating revenues	Fr. 297,128,574.11
Freight and other miscellaneous operating revenues	2,790,503.85
Miscellaneous revenue (exclusive of interest on investments)	3,021,418.85
Interest on sinking and other funds	641,482.52
Total revenue	Fr. 303,581,979.33
Operating expenses	304,271,425.95
Deficit from operation	Fr. 689,446.62

Charges payable by the Department on new capital	2,358,187.88
Total fixed charges payable by the Department	Fr. 42,608,187.88
Remuneration to the company under the franchise	9,191,335.48
Total of these two items	Fr. 51,799,523.36
Deficit from operation (as given above)	689,446.62
Total deficit for year	Fr. 52,488,969.98

Birmingham Company Seeks to Defer Nov. 1 Interest

The receivers of Birmingham Railway, Light & Power Company, Birmingham, Ala., are of the opinion that their cash resources between now and July 2, 1924, will not be sufficient to discharge all of the obligations which they will be called upon to meet by that date. Among these obligations are \$787,000 in principal amount of underlying bonds which mature July 2, 1924. In consequence they have filed with the court a petition in which they recommend that the interest which falls due Nov. 1, 1923, on the refunding and extension mortgage 6 per cent gold bonds be not paid. The question of whether or not the interest due on Nov. 1 shall be paid will come before the United States District Court at Birmingham on Oct. 30.

In view of the situation created by this appeal to the court the holders of the refunding and extension mortgage bonds organized with L. Carroll Root, vice-president of Newman, Saunders & Company, Inc., New Orleans, La., as chairman. This committee has arranged to pay the Nov. 1, 1923, coupon on bonds deposited with it, either by purchase of said coupons or loans secured thereby without interest. It has just announced that more than a majority of the bonds outstanding have already been deposited with the committee. If 60 per cent or more of the bonds are deposited with the committee and the principal is due by declaration or otherwise, the committee says responsible parties have contracted to buy the deposited bonds on or before May 1, 1924, at a price sufficient to yield to depositors the principal of their bonds and 6 per cent interest from May 1, 1923, to the date of payment.

As indicated previously the receivers appealed to the court because of the fear of inability to meet obligations coming due soon. The road has been in the hands of the court under the direction of Lee C. Bradley and J. S. Pevear since Jan. 23, 1919. The receivers have recently made a contract with the city which it is believed will eliminate destructive jitney competition. The ordinance went into effect on Sept. 15. It reduces the cash fare from 8 cents to 7

cents. Under the contract the receivers are required to make extensions and improvements in the service which will require very substantial expenditures. In addition the receivers have substantial amounts of receivers' certificates and bills payable, which will mature on or before July 2, 1924.

Appeals for a \$40,833,292 Assessment of United Railways

The United Railways of St. Louis has appealed to the State Board of Equalization to reduce the valuation of the company's property for taxing purposes 20 per cent under the rate-making valuation fixed by the Missouri Public Service Commission at approximately \$52,000,000.

If the Board of Equalization would accept the suggestion to reduce the assessment 20 per cent, it will be fixed at approximately \$42,000,000 for taxing purposes this year. The company in appearing before the commission contended the valuation for rate-making purposes should be approximately \$70,000,000.

The combined properties of the United Railways last year were assessed at \$47,756,000, while the State Tax Commission this year recommended a combined assessment of \$46,767,000, including the Missouri Electric Company.

The company paid 9.4 per cent of its total gross income last year for taxes.

Plea for Greater Participation by Owners

S. W. Huff, president of the Third Avenue Railway, New York, N. Y., has addressed a letter to the holders of the 5 per cent adjustment bonds inviting them to vote on the company's policy. Bondholders, he pointed out, are entitled to the same voting privileges as stockholders whenever the interest on the bonds has not been paid. He says that a comparatively small number of holders of these bonds are availing themselves of this voting privilege and that the directors are anxious to have as large a number of the security holders of the property as possible vote at its annual meetings, either in person or by proxy.

Minority Report Filed on New York Railways Reorganization

Frank D. Pavey has filed with Judge Mayer at New York a minority report in which he outlines a plan for the reorganization of the New York Railways which he considers much more feasible than the one filed by the majority, referred to in detail in the *ELECTRIC RAILWAY JOURNAL* for Oct. 20, page 718. His suggestion as to the readjustment contemplates the organization of three operating railroad companies designated as the Broadway & Seventh Avenue Railroad, New York Crosstown Railways, Manhattan Street Railway and one non-operating company designated as the New York Railways Assets Realization Company.

Mr. Pavey says the purpose of this grouping is to put the railway end of the business in a position where it can fulfill its duties to the public; where it will no longer be open to attack upon the ground that it is highly overcapitalized and operated solely in the interest of security holders; where it will be in a position to protect the relative rights of the owners of the underlying securities, and where it will be in an advantageous position for sale to the city of New York in case plans for municipal ownership are ever made effective.

Mr. Pavey feels that the plan as proposed by the majority "perpetuates the method of operation which has brought the railways of that system to ruin and to the verge of extinction." It is his opinion that the public can be served better by a series of short lines than by the new company proposed. He thinks that the organization of three operating companies will tend to protect the system in general from the adverse effects of local changes in passenger traffic. It is Mr. Pavey's opinion that the receivership ought to be continued until the affairs of the lessor companies are adjusted. He says that the New York Railways is hopelessly bankrupt, not only in respect to the payment of its private debts, but also in respect to the performance of its public duties.

Security holders of some of the companies have organized to protest against the details of the plan rather than the plan itself.

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of

materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motor-men and conductors on 105 street and interurban railways in the United States, operating more than 100 passenger cars each, and weighted according to number of cars.

North Shore Stock Offered— Remarkable Earnings

Substantial increase in the business of the Chicago, North Shore & Milwaukee Railroad is shown in statements issued on Oct. 18 in connection with the first public offering of \$1,500,000 of 7 per cent cumulative prior lien stock of the company. The earnings of the company for the twelve months ended Aug. 31, 1923, as made public in connection with the offer of the stock are as follows:

Operating revenue.....	\$5,677,652
Operating expenses and taxes.....	4,540,741
Operating income.....	\$1,136,821
Non-operating income.....	27,298
Gross income.....	\$1,164,119
Fixed charges.....	504,516
Net income.....	\$659,603

This statement shows that the sum required to pay the dividends on the new prior lien stock was earned more than six times.

The new stock offering is the first since the recent readjustment of the financial structure of the company. Capitalization of the company comprises a funded debt of \$8,265,400 and authorized capital stock totaling \$20,000,000. Of this \$5,000,000 is 6 per cent preferred and \$5,000,000 is common stock. This stock is already outstanding, but of the \$10,000,000 of prior lien stock only \$1,500,000 has thus far been offered.

The business of the North Shore line has quadrupled since 1916. The total operating revenue in 1922 was \$5,007,951. The enormous growth of the merchandise dispatch business of the line is shown by the following revenue figures covering this branch of the business:

1916.....	\$62,654
1917.....	105,572
1918.....	151,728
1919.....	219,396
1920.....	471,496
1921.....	477,896
1922.....	738,817

The number of revenue passengers carried last year was 15,204,758. The merchandise dispatch business totaled 355,183 tons.

Pamphlet on British Columbia Electric Railway

The British Columbia Electric Railway, serving Vancouver, New Westminster and Victoria, has just issued a booklet of forty pages, with maps, views and descriptive matter of the line and territory which it serves. The pamphlet is handsomely printed and gives a very good idea of the physical surroundings and of the nature of the business done by the property. Copies have been mailed to the stockholders, which number about 15,000, mostly in England. It is also being sent to a selected list of residents in the home territory of the company.

Although the pamphlet is not primarily statistical, some statistics are given, and those showing the traffic of

the company during the last ten years are reproduced below:

TRAFFIC STATISTICS, BRITISH COLUMBIA ELECTRIC RAILWAY			
	Passengers	Tons of Freight	
1913.....	71,973,822	448,750	
1914.....	63,494,023	343,944	
1915.....	46,330,096	231,133	
1916.....	43,021,790	218,065	
1917.....	43,232,630	324,280	
1918.....	52,853,373	365,830	
1919.....	53,326,288	331,794	
1920.....	66,411,030	430,931	
1921.....	71,065,275	413,131	
1922.....	69,314,667	321,081	

The booklet is profusely and artistically illustrated. It was prepared for publication under the direction of J. Lightbody, who is in charge of all the company's publicity and advertising.

Time Extended for Pittsburgh Reorganization

The Public Service Commission of Pennsylvania has extended until Dec. 1 the date for the reorganization of the Pittsburgh Railways to become effective. The company presented the petition and no objection was presented by the city of Pittsburgh, which is a party to the new arrangement under which the company will operate. The master appointed by the Allegheny courts to make a report on the reorganization has reported as of Oct. 11. According to law, the master's findings must be advertised for thirty days before the court can make an order, and the further extension until Dec. 1 was sanctioned by the commission to meet this requirement.

Hearing on Denver Case Concluded

The hearing has been ended on the application of the Denver Tramway for a repeal of the 6-cent fare. Special master Henry A. Dubbs, who has been sitting in the case, will go over the entire evidence and arguments submitted.

Gerald Hughes, attorney for the tramway, closed the case on Oct. 14 by going over the evidence that the city submitted, especially the appraisal for the city made by Dr. Delos F. Wilcox.

Mr. Hughes said that from 1917 to date the Tramway had not earned anything net; that more than \$2,000,000 had been used in betterments and asserted that the physical condition of the system and the service would show that vast improvements had been made. He added that for the city's attorneys to maintain that the tramway lines were losing heavily by natural depreciation was ridiculous as the system's condition would show.

Mr. Hughes answered the arguments of the city's attorneys as concerned franchises. James A. Marsh, for the city, has asserted that there was no perpetual franchise for the company, and Mr. Hughes called attention to the common use of the word "franchise" whereas the word "contract" should be used, and asserted that the company did claim perpetual rights to the use of the streets of the city for street cars.

\$2,801,605 Balance After Preferred Dividends

Nesbitt, Thomson & Company, Montreal, are offering \$1,000,000 of the 7 per cent cumulative preferred stock of the Illinois Power & Light Corporation, which took over the Illinois Traction Company and other properties. The stock is being offered at the market which is around 92½ bringing the yield to more than 7½ per cent.

A consolidated statement of earnings for the twelve months ended July 31, 1923, has been issued in connection with the issue. It shows:

Gross earnings.....	\$26,973,032
Operating expenses, maintenance and taxes.....	18,422,770
Net earnings.....	\$8,550,262
Annual interest on total outstanding funded debt.....	4,492,829
Balance for dividends and amortization. Annual dividend requirements* on 7 per cent cumulative preferred stock.....	\$4,057,433
Balance.....	1,255,828
	\$2,801,605

It is explained that about 70 per cent of the net earnings are derived from power and light.

Money Being Returned to Contributors

Hard luck seems to be pursuing the residents of the territory formerly served by the old Springfield, Troy & Piqua Traction Company operating between Springfield and Troy, Ohio. In the first place the effort failed which was made to secure subscriptions sufficient to keep the road in service and practically all the rails on the west end of the line have been taken up and shipped to the Huntington, W. Va., plant of the Schoenthal Company, Columbus, which purchased the property at its scrap value. As if these were not enough the subscribers who contributed to the fund to refinance the line are confronted with the problem of how best to get back the amount of their subscriptions. The money that had been raised was deposited in the Springfield National Bank, and just before the committee in charge decided to return the money to the various contributors, the bank was closed. Under the first dividend of 33½ per cent declared by the receiver, the committee received a portion of the money back and is now engaged in distributing it, but only 25 per cent is being paid to contributors, the difference between that and the bank dividend going to pay various expenses that have been incurred. Meantime, as noted previously practically all of the rails on the west end of the line are being removed.

Merger of Electric Subsidiaries Proposed.—The stockholders of the Public Service Electric Company, a subsidiary of the Public Service Corporation of New Jersey and United Electric Company of New Jersey, will meet on Nov. 5, to vote on ratifying a merger of the two companies. The Public Service Corporation of New Jersey owns nearly all the stock of both companies.

Fare Fund at Lowest Point in Toledo

Car riding in Toledo has taken an increase in October, which indicates that September, with its net deficit of \$34,484 for the Community Traction Company, is apparently the bottom for the present year. For the first half of October gross revenue was \$6,000 ahead of the same period last month. Gross revenue for September showed an increase of \$815 over last year to a total of \$301,421, but fixed charges have increased \$22,984 and expenses increased \$23,068 per month this year as compared with last. Wage increases account for a large part of the expense increase.

Daily average of revenue passengers was 158,598 in September, which shows a decrease from August, with a daily average riding of 161,349 revenue passengers.

Feeder bus operations accounted for a loss of about \$455 during the month.

The fare stabilizing fund is now at \$85,938. This is the lowest point it has reached since the Milner ordinance has been in effect.

Auction Sales in New York.—At the public auction rooms in New York on Oct. 24 there were no sales of electric railway securities.

New Director Named.—J. L. Perron was recently elected a director of the Montreal Tramways. In this capacity he succeeds J. W. McConnell.

Gold Bonds Offered.—Harris, Forbes & Company and Coffin & Burr, Inc., New York, are offering \$6,000,000 Alabama Power Company first mortgage lien and refunding gold bonds, 6 per cent series. The issue is being placed at 99 and interest, to yield about 6.07 per cent.

Preferred Dividend Paid in Cash.—The directors of the American Electric Power Company, Philadelphia, have declared a quarterly dividend of 1½ per cent on the preferred stock, payable in cash on Nov. 15 to holders of record Oct. 31. The company on Aug. 15 last paid the preferred dividend in preferred stock.

Bonds Offered.—The National City Company and Halsey, Stuart & Company are offering at 92½ and interest, to yield more than 6½ per cent, \$2,000,000 of the Portland Railway, Light & Power Company first lien and refunding mortgage gold bonds, Series B, 6 per cent. The bonds are dated May 1, 1922, and are due May 1, 1947.

First Mortgage Issue Offered.—Harris, Forbes & Company, New York, N. Y., are offering \$1,000,000 of the Iowa Railway & Light Company first and refunding (now first mortgage) twenty-year 5 per cent gold bonds. The bonds, offered at 93 and interest yielding more than 6 per cent, are dated Aug. 30, 1912, and are due Sept. 1, 1932.

Tells of Creditors' Claims.—General Lincoln C. Andrews, receiver of the New York & Queens County Railway, has informed creditors of the company,

other than the holders of the first mortgage bonds, that he has in hand \$8,010 or less to pay claims aggregating \$7,227,017. They were also informed that this amount was liable for city and Federal taxes and for claims that might arise out of the litigation now under way. Two suits are now pending for the foreclosure of two mortgages held against the company each for \$1,500,000.

Seeks Discontinuance.—The Sistersville Traction Company on Oct. 5 presented arguments before the Public Service Commission of West Virginia for the discontinuance of its railway service at New Martinsville. The company in asking for authority to discontinue such service in the city claimed that it was operating that part of its line at a loss.

Review of Merger Denied.—The Supreme Court refused on Oct. 22 to review the case in which it was sought to have it determine the effect of street railway consolidation in New York City by the New York Railways upon the lien held by the Irving Bank and the Columbia Trust Company in the form of a mortgage upon the property of the Columbus & Ninth Avenue Railroad, a part of the former consolidated company.

Income and Passengers Increase.—The Philadelphia Rapid Transit Company realized a net income of \$1,404,027 for the nine months ending Sept. 30, 1923. This compares with \$1,365,129 for the nine months period ended Sept. 30, a year ago. The total passengers carried from January through September of this year was 677,003,228 against 623,972,005 for the same nine months a year ago. The passenger revenue for the nine months of this year was \$32,595,400 as compared with \$30,645,611 for the nine months ended September, 1922.

City Not Satisfied with Revised Toronto Award.—The city of Toronto will appeal to the Privy Council against the award of the arbitrators to the Toronto Railway in connection with the city taking over the railway at the expiry of its franchise. The award was \$11,188,500. The city appealed to the first divisions court against this amount, and the divisional court reduced it by \$543,500, being the estimated value of certain street railway property which the city need not take over. This, however, is not satisfactory to the city, and the Board of Control agreed to carry the case to the Privy Council.

Railway Bid In.—T. M. Hayes, Huntington, assistant general manager of the Ohio Valley Electric Company, and John Smith, representing Martin & Smith, Catlettsburg, attorneys for the Catlettsburg Street Railway, bid in that property's franchise on Oct. 15. It was sold at the court house at public auction by C. P. Carpenter, city treasurer and special commissioner appointed to conduct the sale. There being no competitors in the bidding the franchise was knocked down at the first bid of \$50. The franchise runs for twenty years.

Will Begin Repayment of Loans.

Having accumulated a cash balance of \$301,191, the Seattle Municipal Railway is in a position to begin repayment of loans from various city funds, which were made to the railway two months ago, when it needed cash to meet its payrolls, after the 5-cent fare experiment had exhausted its funds. Superintendent D. W. Henderson recently informed the City Council of this fact. He suggested that loans of \$100,000 from the city light fund and \$75,000 from the water department, made July 24, be returned. The railway also borrowed from several railway special funds which have not yet been repaid.

Bridge Line Settling Accident Claims.

—The balance sheet of the Manhattan Bridge Three-Cent Line, New York, as of June 30, last, shows surplus of \$10,759; road and electric line, \$147,326; equipment, \$117,727; floating capital, \$29,613; investments, \$74,214; reserve, \$100,421; unfunded debt, \$31,096, and total assets and liabilities of \$592,277. The report states that as a result of the serious accident on May 1, 1923, the reserves for accidents have been used up and before all claims are settled the surplus will be gone. The total amount paid out to Sept. 1, 1923, on account of this accident amounted to \$34,593. The company has settled thirty-seven claims and there are seventeen still pending.

Research Bureau Reports on Finances.

The Bureau of Government Research, in asking where the \$120,000 is to come from for the increased wages recently put in effect on the lines of the San Francisco Municipal Railway, has published in the *San Francisco Chronicle* of Sept. 21 an itemized statement of the railway's income account for the fiscal year, ended June 30, 1923. The total revenue, according to the statement, was \$3,013,552, with total operating expenses of \$2,301,156. After the consideration of interest on funded debt and reserve for depreciation and account, the excess after all payments amounted to \$23,050. The increase of 40 cents a day recently granted to the employees, or a daily salary of \$5.40, would increase the expenses of the Municipal Railway \$120,000 a year.

Time for Deposit of Saginaw Securities Extended.

—Formal announcement was made in New York on Oct. 22 that the reorganization plan for the Saginaw Valley Traction Company, Saginaw, Mich., had been put into effect and the securities of the company are ready for distribution. The protective committee representing the first mortgage gold bonds of the company has extended the time limit for the deposit of bonds under the reorganization plan until Jan. 8, 1924. The committee, consisting of H. M. Addinsell, John R. Macomber and J. W. Hamer, stated that more than 95 per cent of the bonds had been deposited under the reorganization plan. As has been stated before in the *ELECTRIC RAILWAY JOURNAL* the new company, the Saginaw Transit Company, has acquired and is now engaged in rehabilitating the street railway properties in Saginaw.

Traffic and Transportation

Fare Case Before Court

Special Master Considering Arguments in Houston Fare Fight—Fare Increase Imperative

Hearing of the action brought by the Houston Electric Company against the city of Houston to prevent the city enforcing a 7-cent fare ordinance was begun in Federal court on Oct. 9, before Special Master Hunt. The city is represented by John A. Beeler, who has made a careful survey of the traction properties in Houston.

It was indicated early in the hearing that the company will ask for an 8½-cent fare, on the basis that the 7-cent fare fixed by the city is confiscatory and that a fare of 8½ cents is necessary to enable the company to meet operating costs and yield a fair return on its invested capital.

H. P. Gillette, editor of *Engineering and Contracting*, was the first witness presented by the traction company. He testified that the deficit on which the company based its petition was in the earnings, and not due to any mismanagement or lack of economical operation. The company, he said, is entitled to charge a fare that will enable it to meet its operating expenses, when the lines are economically administered, and to yield a fair return on the invested capital.

Net earnings of the company at present, Mr. Gillette said, constitute a confiscation of property, as the company's books show net earnings varying from one-half of 1 per cent to a maximum of 2½ per cent of the investment during the last three years.

Estimated cost of reproducing the property of the company as of May 31, 1923, was given by Mr. Gillette as \$7,601,588 minus depreciation, with true net earnings of \$112,346, or, by the "sinking fund" method of calculation, an earning of only 1½ per cent of the invested capital.

Mr. Gillette then showed that the amount of the alleged deficit for the year ended May 31, 1923, divided by the number of fares collected in the preceding year, showed that to bring revenues up to a point where a fair return on the invested capital would be produced it would be necessary to add 1.7 cents.

The average fare paid in 1922 was 6.8 cents and the added 1.7 cents would produce a fare of 8½ cents.

Reproduction cost now is about 64 per cent higher than in 1914, counsel for the traction company stated to the court, explaining that in 1919 Judge Hutcheson of the Federal District Court allowed a reproduction cost about 33½ per cent higher than in 1914 and the Supreme Court had held that the Houston court did not err, although the company attacked this point in its suit.

C. J. Kirk, Public Service Commissioner of Houston, sought to prove that Stone & Webster are overpaid for the work which they do in supervising the operations of the company at Houston.

Service Increases Noted in Chicago

Twice recently Mayor Dever has commended the Chicago Surface Lines for improvements in service. With the installation of all day trailer service on Madison Street on Oct. 14, he again issued a public statement. Trains previously had been operated during rush hours only on other routes, but with the arrival of cars of sufficient motor capacity it became practicable to keep the two-car trains in all-day service. Madison Street is one of the heaviest arteries of travel in Chicago. Its complement now is eighty-nine motor and sixty-six trail cars for weekdays, service having been increased about 20 per cent. Results have been most encouraging to the company as the business continues to grow daily.

Cars in operation on the system have increased 220 since a year ago. Of the 214 new cars ordered some time ago, 184 have been placed in service. Besides, schedule revisions have added the equivalent of thirty-six more cars. Sixty other cars are being built. About 50 per cent of the schedules have been revised since Jan. 1, with the result that 1,525 round trips have been added daily, or more than 6 per cent gain on these changed routes.

Seeks Increased Fare in Oklahoma City

The Oklahoma Railway, operating in Oklahoma City, has asked for authority to increase its fares to 8 cents, and a committee of business men which investigated the financial condition of the company has recommended to the State Corporation Commission that the increase be granted.

John Shartel, general manager of the company, said that the 7-cent fare with four tokens for a quarter now charged is not sufficient to meet operating expenses and that unless relief is granted the company will be compelled to go out of business in Oklahoma City. The traffic has suffered greatly because of the increase in the number of automobiles, Mr. Shartel said.

The company operates interurban lines in three directions out of Oklahoma City and plans to electrify the steam railway from Oklahoma City to Shawnee. Mr. Shartel said that unless relief for the local situation in Oklahoma City is granted the electrification project would be dropped, at least for the present.

Bid for Co-operation

Saginaw Operator Seeks to Impress Business Men with Need for Their Help

"Your job did not end when you approved the franchise; in fact your job just started. From now on you have your biggest job, to help us to make the system all you want it to be, to give the kind of service you want."

"You have an ideal system here—the money supplied to you, and your own people directing the company. Try it, with the help of every man, woman and child in the community. We are at your service, and all we ask of you is patience and co-operation while we are working out the details."

These were the words with which Charles S. Kressler, president and general manager of the Saginaw Transit Company, concluded a speech which he made a few days ago before the members of the Exchange Club. Street railway service in Saginaw has been shut down for two years, and Mr. Kressler knows that he has a tough job ahead of him. He hopes to resume railway service on Nov. 15. The new buses are arriving and they, too will be placed in service soon. Mr. Kressler made no bones about the fact that his talk was a bid for support for the new enterprise. He said some things to business men that might well be repeated elsewhere. Mr. Kressler painted the picture with these words:

"When you consider the transportation problem in a city the size of Saginaw you realize that in a city of 60,000 to 200,000 people there are not enough people who do not own or cannot afford automobiles to support a transportation system properly. Where is the revenue coming from to pay the cost of operation?"

"At present many of you get into your autos in the morning and after driving downtown park them in front of your places of business. That space does not belong to you. You should ride to and from your work on the transportation system."

"You are after the business of the farmers, but when the farmers find a place to park downtown they buy in nearby communities, instead of coming to the business center to trade. Within the past few years the business of the neighborhood stores has more than doubled because the people can't find places to park downtown. They buy nearer to their homes. Instead of coming to town frequently to buy, the farmer comes only when it is absolutely necessary."

"It is a merchandising problem, but it also has to do with transportation. I believe that if more attention were paid to that question it would mean proper support to the transit company as well as a profit to yourselves, the appreciation of the farmers and a whole lot better feeling in the community."

"If you drive your own car down to work and back twice a day it will cost you 40 to 60 cents a day, while you can ride on the street car the same number

of times for 25 cents. You can't afford to drive your own car when you have a good transportation system—and that is what we are trying to give you. In doing this we want your co-operation. In fact, we must have it if we are to succeed. It is as much your problem as it is ours."

Mr. Kressler expressed the need for greater care about safety, particularly in view of the fact that during the period the street cars were withdrawn autos were permitted to wander all over the streets.

Adopts Traffic Resolution in New Orleans

The Commission Council of New Orleans by a vote of four to one (Mayor McShane dissenting) adopted on Oct. 17 the resolution of Commissioner Paul H. Maloney of the Department of Public Utilities to open up North Rampart Street from Esplanade to Elysian Fields.

The widening of North Rampart Street will cost approximately \$500,000,

Salt Lake City Has New Interurban Station

The new interurban station for electric railroads of Salt Lake City was formally opened to the public on Oct. 4. Former Gov. Simon Bamberger, chairman of the board of directors of the Bamberger Electric Railway, with other officials of that road and of the Orem Electric Railway, were on hand. All officials were commissioned as ushers and guides. A thorough inspection of the structure was made by a large number of guests.

The big waiting room, which is 125 x 42 ft. in dimension, with a ceiling two stories high, was specially decorated and lighted for the occasion, and all other parts of the new building were in festive garb.

The building, which is the local terminal of the Bamberger and Orem lines, was constructed by the two electric roads at a cost of \$300,000. The second story is divided into offices, including those of the traffic and operat-

tion is announced, will make possible next morning deliveries to points south, as well as at Warsaw and Goshen, with noon deliveries at South Bend. Freight destined for this service may be delivered at the electric railway freight terminal up to 4 o'clock in the afternoon.

Wyandotte Division of Detroit United Reopened

Interurban service was resumed on Oct. 20 on the Wyandotte division of the Detroit United Railway. The road has been shut down since August, when the city of River Rouge obtained an injunction restraining the company from operating through that municipality. The injunction was issued when the railway company attempted to increase fares.

The resumption of service was the result of an order issued by Judge Henry A. Mandell in the Circuit Court directing the railway to sign bonds for \$25,000 pending the outcome of litigation.

Railway Station and Office Building at Salt Lake Adds Greatly to City's Attractiveness

one-half of which expense will be borne by the Public Service, Inc., and the other half by the city. In order to hasten the work of improvement the Public Service, Inc., has signified its willingness to advance the entire sum, to be reimbursed later by the city for its share of the expense. For this purpose, the resolution adopted directs the budget committee of the city to set aside \$125,000 out of the budget of 1924 and a like sum out of the 1925 budget.

Commissioner Paul Maloney pointed out in his resolution that the annual yield from present grants to the Public Service Inc., together with that derived from an agreement made with the Cumberland Telephone & Telegraph Company, available for municipal improvements would be materially increased in 1924 and 1925 and that this should approximate the total cost of financing the project. The project contemplates widening the street for a lineal distance of 2,900 ft., and it is quite likely that work will be started soon and rushed through to completion.

A paragraph in the Beeler report on traffic conditions in the city points out the immense benefits to be derived from this work of improvement, "affording a great artery for all traffic to this important industrial center."

ing departments of the two roads. On the first floor the waiting room and ticket office, which are handsomely finished in marble and tile, occupy the central position, while at the south end of the building there are offices and stores facing the street.

The Bamberger Electric line was started in 1890 by its present head. It was built as far as Lagoon in 1895 and into Ogden in 1908 and was electrified in 1910. The Orem electric line was started in 1911 and completed as far as Payson, Utah, about three years later.

Expedites Freight Deliveries

The electric lines play an important part in a campaign for better and more rapid and efficient freight service to towns and cities served by Fort Wayne jobbers and shippers. In a systematic effort to expedite shipments and provide "next morning deliveries" to towns in this territory, the traffic and transportation bureau of the Chamber of Commerce, in co-operation with the Fort Wayne Traffic Bureau, has arranged a schedule to provide rapid service over the electric railways to points between Fort Wayne and Lafayette, Ind., on the south, and Warsaw, Goshen and South Bend, Ind., on the west. The schedule,

tion started by the township of Ecorse, one of the down-river communities served by the Wyandotte division.

Plans for resuming car service between Detroit, River Rouge, Ecorse, Wyandotte, Riverview, Sibley and Trenton were about completed when a new barrier was raised by the Ecorse Township Board. It was claimed by the board that the railway owed more than \$20,000 as the company's share of the expense of a bridge connecting Ecorse and Wyandotte. Ecorse backed up its claims by nailing planks across the company's tracks on the bridge and guarding the bridge.

The bridge was erected about eight years ago and it was claimed by the Ecorse officials that at the time the bridge was built the work was done with the understanding that a friendly suit was to be started against the railway to determine what proportion of the cost should be paid by the company. The suit, it is claimed, was never called, and Ecorse officials refused to accept settlement offered by the company. The question was raised as to whether the company was legally bound to pay anything toward the expense of the bridge, the contention being made that the claim was outlawed according to the statute of limitations.

Report on Louisville Fund After Jan. 1

Charles Roser, auditor of the Public Utilities Bureau of Louisville, stated that there would be no report issued on the barometer fund of the Louisville Railway until some time after Jan. 1. Because of several questions about the matter, he has explained the working fund and the chances for a lower fare for Louisville citizens in the future. Mr. Roser said that under the ordinance providing for the barometer fund the Louisville Railway created a cash fund of \$350,000 on Jan. 1, 1923, so that computation was based on that amount. If at the end of any operating period the fund exceeded \$500,000 the fares were to be decreased. When the barometer fund reached \$500,000 the public should get the first benefit in the reduction of fares.

He said that the report would be made some time after Jan. 1, 1924, as the period on which this report will be based ends Dec. 31, 1923. He said also the stockholders of the railway would get the benefit of an increase in the barometer by a rate of return on the common stock. When the barometer fund exceeded \$500,000 he said that the excess would be withdrawn and one-third of the excess paid into the city treasury, one-third to the company to be distributed among its employees and one-third retained by the company as corporate funds.

Six-Cent Fare Extended.—The City Council of Richmond has extended the 6-cent fare on the lines of the Virginia Railway & Power Company for six months. The company began operating under the extended privilege on Oct. 11.

Eight-Cent Fare Asked in Tulsa.—The Tulsa Street Railway, Tulsa, Okla., reports to the Corporation Commission an operating loss of \$15,910 in the first seven months of 1923, \$4,407.61 of which was incurred during July. An 8-cent fare is asked.

Fares to Be Advanced.—Fares in Iowa City will be advanced to 7 cents. The Mississippi Valley Electric Company announced that it can no longer afford to operate on a 5-cent fare. Local bus lines also will increase their fares. Car and bus tickets will be sold at the rate of four trips for a quarter.

Will Extend Freight Service.—Wide extensions in freight service on the Tiffin & Fostoria Railway, Tiffin, Ohio, line are soon to be put into effect. Through freight service from Tiffin to Cleveland went into effect on Sept. 20 and through service to Dayton and Cincinnati will be put into operation soon.

Ride for One Cent.—The Danville Traction & Power Company, Danville, Va., designated Sunday, Sept. 30, as "1-cent fare day." On that day the public was allowed to ride on any street car for 1 cent. The purpose was to give the patrons an opportunity to inspect five new double-truck cars which were put in operation on that day.

One-Man Cars Up to Voters.—Plans are being made by local labor unions of Sacramento to place on the ballot at the coming municipal election in November a measure pertaining to one-man car service. Conferences were arranged recently by the city at which were present officials of the Pacific Gas & Electric Company and representatives of the local labor unions.

Wants to Operate a Bus Line.—The Pennsylvania & New Jersey Railway has filed with the Trenton City Commission a petition to establish a bus line that will operate between Trenton, N. J., and Morrisville, Pa., in co-operation with the present electric railway service. The company wants to establish a terminus in the center of Trenton and run buses over the Delaware River bridge. The fare will be the same as charged by the railway, with transfer privileges to the trolley company.

Commission Protects Railway from Competition.—The Corporation Commission of Oklahoma has denied the application of J. E. Clark for a certificate of public convenience and necessity to operate a motor vehicle between Muskogee and Fort Gibson. In so doing the commission sustains the protest of the Muskogee Electric Traction Company, which stated that it now furnishes a full and complete service to passengers between those points, and that no necessity existed for additional transportation service.

Keeps Way Clean.—An effective remedy has been found by the Rockford & Interurban Railway, Rockford, Ill., for keeping the right of way free from weeds, grass, etc., in an improvised mower, hooked on behind the trolley car. The attached mower is fitted with standard wheel equipment, a seat is attached for the operator and two scythes are placed in wing fashion on the right and left side of the rails, the trolley car in front pulling the mower. The mower is similar to the one described in the ELECTRIC RAILWAY JOURNAL for Oct. 6, page 569.

Bus-Trolley Service.—A contract has been let by the Monongahela-West Penn Public Service Company as a preliminary to operating a bus service between Rivesville and Morgantown, W. Va. It will be possible for persons desiring to make the trip between Fairmont and Morgantown to obtain a combination ticket that may be detached for carfare on the trolley cars between Fairmont and Rivesville or Rivesville and Fairmont, so that the fare between Morgantown and Fairmont will be 91 cents. All buses will be met at Rivesville by cars of the Monongahela-West Penn Public Service Company.

Will Continue Through Business Center.—According to an order of Edwin M. Walker, president of the Schenectady Railway, service on the Albany-Schenectady interurban line will continue through the business district of Albany and turn at the Fulton Street loop, as a means of accommodating merchants and shoppers. Heretofore

all local Albany cars turned at the waiting room, but it was found out following the traffic survey that the continuation of the schedule to include the downtown district was more than warranted. Mr. Walker in announcing the change said he believed that the interests of the public and those of the company were mutual and that he thought the new plan would prove popular generally.

City Bus Line in Prospect.—A municipal bus line is to be established in West Seattle, between the end of the Alki car line and Lincoln Beach. A citizens' committee is to raise \$4,500 of the purchase price of a bus, estimated at \$7,000, and the Seattle Municipal Railway will then buy the bus and operate it. According to an opinion of Walter B. Beals, assistant corporation counsel, sent to D. W. Henderson, superintendent of railways, the Municipal Railway is not empowered to establish automobile bus service under the local improvement district plan of financing street railway extensions, authorized by the 1923 Legislature.

Safety Assured.—The Tennessee Legislature recently passed an act to insure the public safety at all grade crossings of interurban railroads (outside of the limits of corporate municipalities) on all highways in Tennessee now designated by the State Highway Department as main traveled ways and incorporated in the general highway plan of the State. Under House bill No. 122, Acts of 1923, all interurban trains either freight or passenger, must come to a full stop 25 ft. before all grade crossings in the state and shall not proceed until track is clear of vehicles and pedestrians. The railroads cannot rely on the defense of contributory negligence on the part of person or persons injured or owning the property damaged. Violation of the above act is a misdemeanor punishable by a fine of not less than \$25 or more than a \$100 or by fine of not less than thirty days.

Commission Seeks Solution.—The Traffic Commission of Los Angeles has asked a committee of engineers to furnish it its joint opinion as to what form of subway construction should be adopted to solve the city's traffic congestion problems. The question is whether to adopt a subway system with a central terminal station, a loop system or a diffusive distribution of subway stations. The committee to decide the question is composed of Richard Sachse, street railway expert; Samuel Starrow, nationally known consulting engineer; Franklin D. Howell, public utility expert and chief engineer of the Motor Transit Company of Los Angeles; H. Z. Osborne, formerly chief engineer, Los Angeles Board of Public Utilities, and Alvaro Pratt, subdivision and traffic engineer. The Pacific Electric and Los Angeles Railways, operating the local street car lines serving Los Angeles, have each prepared tentative plans of a proposed subway system.

Personal Items

C. L. Crabbs Retires from Brooklyn-Manhattan

C. L. Crabbs, for seventeen years in the way and structure department of the Brooklyn Rapid Transit System, has resigned as chief engineer of way and structure. Mr. Crabbs has been one of the department heads of the Brooklyn Rapid Transit System since 1909. He joined the organization in 1906 as principal assistant engineer in the way and structure department, when W. S. Menden was chief engineer. Prior to this connection he had been associated with Mr. Menden in engineering work in Chicago during the construction of the Metropolitan West Side Elevated Railway. In 1909, when Mr. Menden was appointed general superintendent of the Brooklyn Rapid Transit System, Mr. Crabbs was promoted to the position of engineer way and structure, and on Jan. 1, 1920, was appointed chief engineer way and structure.

His engineering career began in Chicago in the employ of General William Sooy Smith, and in May, 1892, he joined the staff of engineers engaged in the construction of the Metropolitan West Side Elevated Railway in Chicago. When the "L" construction work was completed, Mr. Crabbs resigned and in 1897 entered the Chicago civil service, first as construction engineer on the Hyde Park sewer system and later as engineer in charge of tunnel construction for the city's water supply system. From 1900 to 1906 he was engaged in the construction of a dock and terminal project along the Hudson River waterfront in Manhattan, and also did some supervisory work in connection with the construction of a factory in Moline, Ill.

Mr. Crabbs was born in Decatur, Ind. He studied engineering at the University of Illinois, from which he was graduated in 1890 with the degree of B. S. in civil engineering. He will establish his home in Florida. On Sept. 26 members of his department presented Mr. Crabbs with a gold watch and chain.

Mortimer E. Cooley Resigns Presidency of Engineering Council

Mortimer E. Cooley, dean of the College of Engineering and Architecture of the University of Michigan, has resigned as president of the American Engineering Council of the Federated American Engineering Societies. In presenting his resignation Dean Cooley said that he retires on account of ill health. He also made it known that he has been granted leave of absence by the university for the second half of the academic year of 1923-1924. With his retirement as principal executive of the Engineering Federation Dean Cooley

rounds out a career of almost half a century in the service of the state, of education and of his profession. Dean Cooley's successor will be formally chosen at the annual meeting of the American Engineering Council, in Washington, D. C., early in January.

Henry F. Merker Appointed Head of B.M.T. Way and Structure

Henry F. Merker has been appointed engineer of way and structure of the surface lines of the Brooklyn-Manhattan Transit Corporation, successor to the Brooklyn Rapid Transit Company, and

H. F. Merker

has direct charge of all work of the way and structure department on the properties of the surface companies. Mr. Merker goes to Brooklyn from St. Louis, where he was construction engineer for the Missouri Rolling Mill Corporation for about two years. For a similar period he held the position of field engineer for the St. Louis Coke & Chemical Company at Granite City, Ill. From 1905 to 1919 he was engineer of maintenance of way for the East St. Louis & Suburban Railway.

Mr. Merker was born in Belleville, Ill. He was graduated from the University of Illinois in 1898. Prior to his joining the staff of the East St. Louis Railway, he was city engineer of Belleville, engineer in charge of power plants at Muskogee and Enid, Okla., and also served on the engineering staff of the Illinois Central Railroad and the Terminal Railroad Association of St. Louis.

Henry J. Kolb has been made engineer of way and structure, New York Rapid Transit Corporation, with direct charge of the way and structure department work on the rapid transit lines and for the South Brooklyn Railway. He has been connected with the engineering department of the system

since 1904. In March, 1913, he was appointed engineer of design of the New York Municipal Railway in connection with the carrying out of the construction work under the dual subway contracts with the city of New York. In 1919 he was appointed engineer of construction in charge of engineering design and construction and in January, 1920, was appointed assistant chief engineer way and structure.

Mr. Kolb received his technical education in the Massachusetts Institute of Technology. He has been connected with the maintenance of way department of the New York, New Haven & Hartford Railroad at Boston; has been identified with the Kansas City, Mexico & Orient Railway, Chihuahua, Mexico, and has been associated with the Pennsylvania Steel Company at Steelton, Pa. He was employed two years prior to May, 1904, as a designing engineer by the New York Central Railroad on the design of the engineering track arrangement of the Grand Central Terminal improvements in New York City.

Harry W. Cushman has been appointed transportation superintendent of the Saginaw Transit Company. He has held the position of assistant superintendent with the Tri-City Railway of Davenport. Mr. Cushman was honored by Davenport railway employees with a farewell party, at which a handsome gold watch was presented to him.

Raymond C. Lenahan has been appointed general manager of the Buffalo & Lackawanna Traction Company, Buffalo, N. Y., to succeed Nelson H. Brown, resigned. Mr. Lenahan was general manager of the Depew & Lancaster Railway, operating a short interurban line from Buffalo to Cheektowaga, Depew and Lancaster. He has resigned as manager of this line, but still retains his place on the board of directors.

M. T. Montgomery has resigned as superintendent of transportation for the Steubenville, East Liverpool & Beaver Valley Traction Company, East Liverpool, Ohio, effective Nov. 1. Mr. Montgomery was formerly general superintendent of the Atlantic & Suburban Railway at Atlantic City, N. J. Prior to that he held executive places with the Pittsburgh Railways, was superintendent of a traction line in Mexico City and later manager of a railway at Monterey, Mexico.

H. F. Cameron, who has been serving as manager of the Arkadelphia-Malvern district since C. P. Couch was transferred to the active vice-presidency of the Mississippi Power & Light Company, at Jackson, Miss., has resumed his position as new business manager. J. E. Couch has been made manager of the Arkadelphia-Malvern district. He was formerly with the Southwestern General Electric Company in Texas, and has had years of experience in the industry.

C. E. Blee has been appointed chief assistant to E. E. Carpenter, recently appointed consulting engineer of the British Columbia Electric Railway in Vancouver. Mr. Blee has worked on the construction of the Copco dam of the California Oregon Power Company, being with that company since 1916, with the exception of a year when he served as assistant professor in the department of civil engineering at Stanford University. He was assistant engineer of the California Oregon Power Company at the time of his recent appointment.

M. R. Frederickson, who has been in charge of the Wisconsin Valley Electric Company at Tomahawk as division manager for the last few years, has been promoted to take over the duties of commercial manager of the company at Wausau. He will be succeeded at Tomahawk by Ralph Lillie, who has been in charge of the purchasing department of the company for many years. In his new capacity Mr. Frederickson, will succeed E. V. Pryor, former commercial manager of the company, who resigned to become connected with the Altofer Brothers Company of Oakland, manufacturers of the A.B.C. electric washing machine. The Wisconsin Valley Electric Company owns and operates extensive electric railway properties in the north central part of Wisconsin.

L. B. West has resigned as auditor of the Pine Bluff Company. Early in the present year when Mr. Longino was made manager Mr. West relieved him of some of the details of this office. Mr. West has been identified with the Arkansas Company for several years. He was a member of the Arkansas force when the properties were acquired from Ford, Bacon & Davis. When Byron C. Fowles, secretary-treasurer, general superintendent and purchasing agent of the Pine Bluff Company, resigned to become general manager of the public utilities in Kingsport, Tenn., in 1917 Mr. West went to Kingsport with him, and when Mr. Fowles returned to Arkansas Mr. West also returned and was made auditor. He plans to leave shortly for the west.

A. R. Delo has been appointed line foreman on the lines of the Beaver Valley Traction Company and the Pittsburgh & Beaver Street Railway, Pittsburgh, Pa. He was recently with the Duquesne Light Company for a period of two years, having previously served as line foreman with the Citizens Light, Power & Traction Company, Oil City during the years from 1900 to 1906. In the latter year he served in a similar capacity with the Franklin Electric Company, and remained there until 1915, at which time he entered the services of the Ridgeway Electric Company at Ridgeway, Pa. He left the latter concern in 1921 to become associated with the Duquesne Light Company. Mr. Delo succeeds John J. Tesh, who resigned as line foreman after having served the company for nine years.

T. J. Lucas

T. J. Lucas and E. S. Hight New Illinois Power Appointees

Two important appointments to the official roster of the Illinois Power & Light Corporation were announced recently by William A. Baehr, vice-president and general manager.

Thomas J. Lucas, electrical and gas engineer of many years' experience and widely known in the public utilities field, was appointed chief engineer, and E. S. Hight, electrical engineer, was made general operating engineer of the big corporation. The headquarters of both will be at Chicago.

For the last fourteen years Mr. Lucas has been associated with the William A. Baehr organization, consulting engineers, Chicago. He has been active in the direction of the engineering work of the Illinois Power & Light Corporation since the organization of this company on June 1, this year, formed by the consolidation of numerous public utility companies of the Middle West, among them the Illinois Traction System.

Mr. Hight is an engineer well known in the field in Illinois. For a number of years he was chief operating engineer of the Illinois Traction Company, with headquarters at Peoria, Ill. He will finish construction of the Topeka, Kan., power house, the transmission line from Topeka to Atchison and the con-

E. S. Hight

struction work under way at the Venice, Ill., power house, properties of the Illinois Power & Light Corporation, and will also be responsible for efficiency and operation of the various power plants of the company.

Obituary

Charles P. Steinmetz

Dr. Charles Proteus Steinmetz, chief consulting engineer of the General Electric Company, died at Schenectady on Oct. 26, after a very brief illness. Dr. Steinmetz was taken sick during a recent visit which he made to the Far West, and although he recovered sufficiently to make the return trip to the East, the attack of illness which he suffered in the west proved fatal because of the patient's lowered resistance.

Dr. Steinmetz was an engineer-scientist whose gifted genius was widely reflected in electrical and chemical experimentation, research and design. His ability was recognized everywhere, and on old and new problems alike his opinions were eagerly sought. His most constructive work was done, perhaps, in connection with the development of alternating current motors, generators, converters, regulators, lighting and the like. His contributions to the advancement of electrical science and indirectly to humanity will probably never be fully appraised.

Dr. Steinmetz was born April 9, 1865, at Breslau, Germany. He was educated at the Breslau gymnasium and university, studying mathematics, astronomy, physics, chemistry and other branches including economics. In Switzerland he studied mechanical engineering at the Polytechnicum of Zurich. In 1889 he came to America and secured a position with the Eickemeyer Manufacturing Company, first as draftsman then as electrical engineer and designer, and finally on research work in charge of the Eickemeyer laboratory. With the absorption of the Eickemeyer interests by the General Electric Company, Dr. Steinmetz was attached to H. F. Parshall's calculating department in Lynn, Mass. When the company's headquarters were transferred to Schenectady, N. Y., in the spring of 1894, he organized and took charge of the calculation and design of the company's apparatus and of the research and development work. Since 1902 he has been professor of Electrical Engineering at Union University, at the same time retaining his connection with the General Electric Company as consulting engineer, organizing and assuming charge of its consulting electrical department in 1911.

Dr. Steinmetz was a fellow of the American Association for the Advancement of Science, a member of the Mathematical Society and of the Physical Society. He was a past president and member of the American Institute of Electrical Engineers. He was the author of more than a score of books and of numerous scientific papers.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions
A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

Small Increase in Use of Wood Preservatives

There has been a relatively small gain in the total amount of timber treated in the United States during the past ten years, according to data compiled by the United States Forest Service, in co-operation with the American Wood Preservers' Association. The total for 1913 was 156,613,888 cu.ft., while that for 1922 was 166,620,347 cu.ft., an increase of only a little more than 6 per cent. During the same period the number of treating plants increased from 93 to 128, or more than 36 per cent. The figures show a decided falling off in 1922 over 1921, in which year there was treated a total of 201,643,228 cu.ft. This was probably due to financial retrenchments on the part of the railroads, the car shortage and the coal situation.

The number of ties treated in 1913 was 40,260,416, as compared with 41,316,474 in 1922, although 55,383,515 were treated in 1921. On the other hand, only 142,069 poles were treated in 1913, as compared with 966,400 in 1922, and there was also a decided increase in the extent of treatment of structural timbers, 138,843,536 ft. B.M. having been treated in 1913, as compared with 152,556,960 ft. B.M. in 1922. Of the ties treated in 1922, nearly 50 per cent were treated with creosote and about 42 per cent with zinc chloride, while the balance were mostly treated with a mixture of zinc chloride and creosote. The total consumption of creosote oil decreased from 108,373,359 gallons in 1913, of which 2,165,736 gallons, or 4 per cent, were imported, to 86,321,389 gallons in 1922, of which 35,462,238 gallons, or 41 per cent, were imported. Zinc chloride, on the other hand, showed an increase in consumption from 26,466,803 lb. in 1913 to 29,868,639 lb. in 1922, the figure for 1921 having been as high as 51,375,360 lb. This indicates a very marked increase in the extent of the use of zinc chloride as a preservative, either alone or in combination with creosote or other preservatives.

Westinghouse Shows Gain

Orders of the Westinghouse Electric & Manufacturing Company for the quarter ended Sept. 30 amounted to \$41,940,000, compared with \$37,453,000 for the corresponding period last year and \$47,649,000 for the quarter ended June 30, 1923. Sales billed for the three months ended Sept. 30 were \$38,619,500, against \$30,291,800 in the 1922 period and \$35,094,800 in the first quarter of this year ended June 30.

For the first half of its fiscal year Westinghouse booked \$89,589,100 new

business, an increase of 28.8 per cent over the corresponding 1922 period. Total incoming orders for last year were \$152,328,564. Billings for the half year amounted to \$73,714,300, topping 1922 by 31.6 per cent.

Lumber Specifications Available

Recommendations from the Department of Agriculture for the standardization of grading specifications for yard lumber and for structural timbers will soon be available in circular form. Distribution of the circulars will probably be from the Forest Products Laboratory at Madison, Wis. The first editions, consisting of a few thousands each, will be distributed free on request as long as the supply lasts. In order to make the distribution as effective as possible, the laboratory will give priority to all direct requests received now, before the circulars are sent out to its general mailing list.

World Production of Coal, January-June, 1923

A summary of the data received by the United States Geological Survey up to Oct. 15 shows a total of approximately 666,000,000 tons of coal produced during the first half of 1923. This is an increase of about 79,400,000 tons, or 13.3 per cent, over the corresponding period of last year. Nearly all the countries listed have increased their production, the most notable increases being in the United States, United Kingdom and Poland. The proportion contributed by the United States was 44 per cent of the total. The accompanying table gives the figures.

PRODUCTION OF COAL IN PRINCIPAL COUNTRIES OF THE WORLD, JANUARY-JUNE, 1923.

(In metric tons of 2,204,622 lbs.)

Country	Metric Tons	Per Cent of Total
North America:		
Canada	7,912,610	1.19
United States	294,261,000	44.18
Europe:		
Austria: Coal	74,698	.01
Lignite	1,242,196	.19
Belgium	11,127,700	1.67
Czechoslovakia: Coal	5,919,835	.88
Lignite	8,725,861	1.31
France: Coal	17,659,350	2.65
Lignite	433,741	.06
Hungary	3,807,521	.45
Netherlands	2,686,246	.40
Poland	21,680,056	3.25
Russia	5,609,000	.84
United Kingdom	143,051,102	21.50
Asia:		
British India	10,074,000	1.51
Japan	13,745,000	2.06
Africa:		
Rhodesia	250,447	.04
Union of South Africa	5,222,674	.78
Total	666,000,000*	100.00*
* Germany, South American countries and others not shown individually are included in the total.		

Electrification Progress in Mexico

Orders have been placed with the International General Electric Company for an 11,250-kva., 4,000-volt water-wheel generator to furnish power for the electrification of the Maltrata Incline of the Mexican Railways, contract for which was let to this company recently. More than 50,000 kva. in water-cooled 60-cycle transformers designed for 42,000 volts primary are also included in this order. This is the second important step in beginning electrification. Shipment has been completed from Schenectady and Erie of the overhead line equipment, including trolley wire, feeder hangers, etc.

The 3,000-kw., 3,000-volt motor-generator sets for the substation to be located near the center of the electric division will be the largest ever constructed for this voltage. These are now being assembled for test, while the locomotives are themselves nearing completion at the company's Erie works.

General Electric Will Buy the Canadian General Electric

The directors of the Canadian General Electric Company have unanimously approved the offer made by the General Electric Company for the purchase of the stock of the first-mentioned Company. It appears that only the formal ratification by the stockholders is necessary to consummate the agreement.

A question has been raised in regard to the probable disposition of the subsidiary companies in Canada, particularly the Allis-Chalmers Company, which has factories at Toronto, Montreal, Bridgeburg and Stratford. These plants were greatly expanded during the war, but recently have been unprofitable.

The Canadian General Electric Company has an authorized capitalization of \$18,000,000 of common stock, of which \$10,800,000 is outstanding. There is also \$2,000,000 of 7 per cent cumulative preferred stock outstanding. It is thought likely that the agreement will include a stock conversion feature. In order to give the stockholders ample time to consider the offer special stockholders' meetings will probably not be held before the latter part of this year.

Metal, Coal and Material Prices

Metals—New York		Oct. 23, 1923
Copper, electrolytic, cents per lb.		12.67
Copper wire base, cents per lb.		15.25
Lead, cents per lb.		6.85
Zinc, cents per lb.		6.65
Tin, Straits, cents per lb.		41.125
Bituminous Coal, f.o.b. Mines		
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons		\$4.575
Somerset mine run, Boston, net tons		2.25
Pittsburgh mine run, Pittsburgh, net tons		1.875
Franklin, Ill., screenings, Chicago, net tons		1.45
Central, Ill., screenings, Chicago, net tons		.925
Kansas screenings, Kansas City, net tons		2.25
Materials		
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.		\$6.60
Weatherproof wire base, N. Y., cents per lb.		18.00
Cement, Chicago net prices, without bags		\$2.20
Linseed oil (5-bbl. lots), N. Y., per gal.		\$0.95
White lead, in oil (100-lb. keg), N. Y., cents per lb., carload lots		11.25
Turpentine, (bbl. lots), N. Y., per gal.		\$0.99

Rolling Stock

Long Island Railroad, New York, N. Y., has placed the contract for motors and control apparatus for sixty new cars with the Westinghouse Electric & Manufacturing Company. Each car will be equipped with two 225-hp. motors arranged for multiple-unit control. This new equipment, which involves approximately \$600,000, was referred to in the *ELECTRIC RAILWAY JOURNAL*, issue of Sept. 22, 1923.

Track and Line

Northern Texas Traction Company, Fort Worth, Tex., has completed a feeder line to supply current for operation of cars on the Seminary Hill Line.

Los Angeles Railway, has started work on reconstructing the West Forty-eighth Street track between Gramercy and Van Ness. The reconstruction of Hill Street from Fourth to Eighth has been completed.

Saginaw Transit Company has placed track orders for March 1 delivery. The company will then proceed with replacements which have been ready for the junk yards for many months.

Tama & Toledo Railroad, Toledo, Iowa, is tearing up its old rails at Toledo and is replacing them with heavy steel. The rails are being welded. Concrete and cement filling is being put in at the end of the ties instead of the old brick.

Connecticut Company is ready to double track the construction through Capitol Avenue in co-operation with the city betterment project of widening that street. The Capitol Avenue widening calls for widening the thoroughfare from Main Street to Trinity Street.

Harrisburg Railways has completed construction of work on North Cameron Street between Calder and Maclay Streets. Construction extends for a distance of 2,850 ft. and costs the company approximately \$30,000. The work was accomplished within twenty days.

Dallas Railway has been granted a requisition for construction of the new line in Oak Cliff. The new line will begin at Tyler Street and Jefferson Avenue, extending southward along Tyler Street to Burlington Boulevard, westward along Burlington Boulevard to Waverley Drive. The cost of the new line is estimated at \$200,000.

New York State Railways has applied to the Public Service Commission for permission to build and operate a single track extension of its lines from the present terminal in Salina along the Syracuse-Bridgeport highway, a distance of 2,200 ft., thereby forming a loop. The extension is to afford transportation facilities to a large factory about to be constructed along the company's lines.

Wilkes-Barre Railway will install new double tracks on West Market

Street from the Public Square to River Street, just as soon as the Goeringer Company has the street in readiness for the work. After the double-tracking is done, the street will be repaved with sheet asphalt. The work will be rushed with all possible haste. With the new improvement will come the removal of all poles and wires.

Kansas City, Clay County & St. Joseph Railway, Jefferson City, Mo., will pay \$7,304 of the cost of an overhead crossing on the State Road from Liberty to Excelsior Springs. This is in accordance with an order previously issued by the Public Service Commission requiring the company to pay one-half of the estimated cost. The total project is estimated at \$14,608. The bridge will be constructed under the direction of the Highway Commission.

Birmingham Railway, Light & Power Company, Birmingham, Ala., has placed an order with the Buda Company for special trackwork layout to be installed at the railway's carhouse at Third Avenue, Tenth and Eleventh Streets, Birmingham. This layout consists of fifty-five branchoffs, and is probably the largest single layout purchased in the southeast for a number of years. Construction is to be of the new A.E.R.E.A. 7-in. guard rail with solid manganese switches.

New York, N. Y.—The Transit Commission will receive bids on four important rapid transit contracts on Nov. 2, constituting the largest amount of contract work upon any one occasion since the time of the construction of the dual system of rapid transit. Two of the contracts cover the construction of a portion of the Flushing extension of the Corona branch of the Queensboro subway. A third contract calls for the removal of the kiosks which block the curb line and encroach upon the roadway of Broadway at the 157th Street Station of the Interborough Rapid Transit Company. The remaining contract for which bids will be received is for frogs, switches, tracks, etc., for the 180th Street yard of the Interborough, adjacent to Bronx Park.

Power Houses, Shops and Buildings

American Electric Power Company, Wilmington, Del., has bought two Westinghouse new model multiple-retort underfeed stokers.

Texas Electric Railway, Dallas, has begun work on a new passenger and express station at Ennis. James P. Griffin, vice-president of the company, in announcing the beginning of work on the new station, said it would cost \$17,000 and is to be completed by Jan. 1.

United Light & Railways Company, Grand Rapids, Mich., is contemplating a central power station in the vicinity of East Moline, Ill., with a capacity of at least 150,000 kw. and to cost approximately \$10,000,000 when completed. The United Light & Railways power plant is now located at Moline, Ill.,

where it is in close proximity to a hydro-electric station. This combined central station, while recently expanded, will not be able to serve the rapidly growing demands of this industrial community for electrical energy and the new plant is made necessary to provide for the industrial development of the next decade.

Trade Note

Westinghouse Electric & Manufacturing Company at its South Philadelphia Works has established a general engineering division which will be devoted to the study of central-station and industrial plant problems, which involve the application of steam power apparatus such as steam turbines, condensers and reduction gears. This department will also co-operate with the sales organization in providing engineering service to purchasers of this equipment.

New Advertising Literature

Ohmer Fare Register Company, Dayton, has issued form 400, entitled "Making Money by Saving Money."

Economy Electric Devices Company, Chicago, has issued a sheet—a reprint from *Electrical Traction*—entitled "The Air Rectifier Eliminates Frozen Air."

Hauck Manufacturing Company, Brooklyn, N. Y., has issued bulletin No. 506, illustrating and describing the new Hauck Venturi low-pressure burners.

Combustion Engineering Corporation, New York, N. Y., has issued Catalog L-1, entitled "Lopulco Pulverized Fuel Systems." The pamphlet explains the Lopulco system as designed for stationary boilers.

Hale-Kilburn Company, Philadelphia, Pa., has issued a forty-page pamphlet on car seats for electric railways. The various designs of seat types for car equipment are described in detail with photographs giving the standard features of the particular type of seat.

Torchweld Equipment Company, Chicago, has issued a new catalog covering its complete line of oxyacetylene welding and cutting apparatus, lead welding, soldering, brazing and decarbonizing units, gas pressure regulators, automatic machines, generators and supplies. The catalog contains cross-sectional views of equipment with detailed explanation, is 8½ in. x 11 in. and consists of forty pages.

Garland Ventilator Company, Chicago, represented by Hegeman-Castle Corporation as general agents, has issued a twelve-page circular descriptive of the Garland steam and electric railroad ventilators. In a list of thirty-six typical orders recently received by the company are included sixteen from electric railway car builders and prominent electric railways. A list of representative railroads using Garland ventilators includes fifteen electric railways.

Electric Railway Journal

Consolidation of Street Railway Journal and Electric Railway Review

Published by McGraw-Hill Company, Inc.

HENRY W. BLAKE and HARRY L. BROWN, *Editors*

The Electric Railways Are Coming Back

SO MUCH evidence has accumulated showing the electric railways are coming back, that they now have a real story to tell to the financial world. An opportunity to do that came last week at the convention of the Investment Bankers' Association in Washington, D. C., and J. W. Welsh, executive secretary American Electric Railway Association, made the most of an invitation to speak on the electric railway situation. His address is presented elsewhere in this issue. It consists of a plain statement of facts, forming for the bankers inescapable proof that the electric railways are making noteworthy progress in working out their difficulties. They are surely coming back.

That was the most important message the industry had to give the investment bankers, for many of them have not been cognizant of the improving situation and have continued their disapproval of these securities. In reality the time is not far distant when electric railway securities are again going to be considered in the investment rather than the speculative class. And this the investment bankers want to know. So Mr. Welsh's talk was timely and helpful.

An Intensely Interesting Narrative of Railroad Development

LEST some readers may have missed it, special attention is directed to the publication in the JOURNAL for Oct. 20 of the brief of the Chicago, North Shore & Milwaukee Railroad submitted in the contest for the Charles A. Coffin gold medal prize. Every one interested in electric railways will find the reading of that brief most interesting and profitable. The editors of this paper were familiar with the matter set forth in the brief, as practically every accomplishment recorded there had been related in the JOURNAL as it was done. And the 1922 Annual Convention Number of the JOURNAL devoted fourteen pages to a story surveying all the things that had been done to build up this property.

Yet the editors found this brief—the road's own story of its accomplishment—the most interesting narrative of electric railway development they had ever read. It is a plain statement without embellishment of what has been done, the methods followed and the results obtained. It ought to be read and reread by every interurban railway man in the business, for it contains a host of practical, proved suggestions of things that can be done to build up a railroad. Of course it is realized that fundamentally this line had something to build on, but aside from having a good right of way between good terminal cities, few roads are any farther down the scale of physical and public relations imperfection, as a basis to build on, than was this line.

That the development of the road has involved more than ordinary progressiveness is reflected in the frequency with which it has been the subject of comment and articles in this magazine. Having thus followed the work of Britton Budd and his associates, the JOURNAL indorses the finding of the Coffin prize committee, for it believes a record of accomplishment is set up here that is without parallel in recent electric railway history. And the significant thing is that it has all been done by simple, ordinary means. There has been nothing spectacular or superhuman in the program. It is just the accumulative result of a thousand little improvements, but coupled with a sound, sincere policy of giving the public what it likes and wants.

The Motor Bus at the Convention

TO SHOW the progress of the electric railway industry toward acceptance of the motor bus, and the general thinking about the bus, it is interesting to bring together the gist of the discussion on this subject at the recent convention.

L. S. Storrs, president the Connecticut Company, observed that today we find the careful students of transportation in practical agreement that the two agencies (railway and bus) must be co-ordinated. As to how to establish co-ordination, he said that the necessary preliminary to any effort to co-ordinate these two agencies is a public opinion that will support legislation which recognizes that the two agencies are merely different means of providing a convenient and needed public transportation service, which must be unified in order that the various communities may have a thoroughly efficient transportation service at the lowest possible rate. We can talk all we please, he said, about co-ordinating these facilities, but we can accomplish nothing until public opinion is of a temper to accept the needed regulation. Real co-ordination devolves upon the transportation utilities, and a full measure of bus operation should be undertaken as rapidly as the need for service is apparent and funds available to provide the equipment.

Of the situation in California, where bus competition has been most intense, D. W. Pontius, vice-president and general manager Pacific Electric Railway, told of the material progress that has been made in correcting the situation—partly by the railways themselves going into the bus business and partly through legislation. The main point cited in correcting the situation was the legislation effected imposing a tax of 2 cents a gallon on gasoline and requiring that buses and trucks operating in common carrier service must pay to the state 4 per cent of their gross revenue.

Pertinent among the statements made by the com-

mittee on bus operation was one that if a railway company adopts the policy of providing all transportation needs in the territory served, the possibilities of the bus as an aid to such a policy cannot be overlooked. While noting that supplanting of existing rail lines with bus routes is a matter of economics, the committee acknowledges that it will be found that when rail lines with low earning power are faced with heavy rehabilitation or paving charges, the bus can be used as a means of continuing service with an expenditure for equipment much below the cost of plant renewals or paving. It is also asserted that the electric railways are becoming increasingly interested in the use of the bus in meeting the full requirements for transportation in the territory which they individually serve.

H. W. Alden, president Society of Automotive Engineers, the engineering association of the automotive industry, in a friendly discussion of the report of the committee on bus operation, pointed out how this report lacked comprehensiveness in several respects. He observed that the figures presented in the report would have been somewhat different if independent companies had been included, because a great many bus companies are making money. His principal mission in appearing before the railway association was to encourage and urge co-operation between the railways as bus users and the S.A.E., in order that designs of buses may be developed which will meet the requirements of service.

Another non-railway man who addressed the association was Alfred Reeves, general manager National Automobile Chamber of Commerce, the body which primarily looks after the business interests of the automotive industry. No progressive railway man could take exception to his remarks. Out of an interesting address, these few thoughts are worth repeating here. He said that with the present congestion of traffic and concentration of population, the trolleys cannot properly handle all street transportation. They cannot afford to build in sparsely settled territories. Nor can the bus do it alone. Think how many buses would be required, he says, to supplant the trolley which last year carried 15,000,000,000 passengers. A combination of trolley and bus seems to be the real answer. In certain fields of street transportation, the trolley is supreme in efficiency and economy. In other places, the bus holds a similar position. This demands that the two forms be co-ordinated. The prime consideration, therefore, is to fix the fields of endeavor which each shall enjoy.

Speaking of the opportunity which the bus affords to railway men, he said that as experts the trolley people have a rare opportunity to enter the bus field and thus give the public complete transportation. By hesitating, trolley men have missed some golden opportunities, although it is not too late if they will enter the field in the proper spirit. He offered the suggestion that unless the electric railway interests take steps to discharge the apprehension held by many people that if the railways take over the buses it will be for the sole purpose of bringing about their elimination, their entrance into this new field will not receive a proper welcome.

On the matter of regulation, he commented that the automotive industry is in accord with the railway industry, so far as it relates to state supervision of common carriers. He reminded the railway audience that more than two years ago the National Automobile Chamber of Commerce declared that control over motor vehicles as common carriers if deemed necessary should

be placed in existing state commissions, and that as a prerequisite to operation the owner should be obliged to obtain a certificate of convenience and necessity. A proviso in this declaration was that lines in actual operation should *prima facie* be regarded as necessary.

The Opportunity of the Railway Association

WITH the best thinking inside and out the railway association now concurring very largely in the desirability of co-ordinating bus with railway, and of preserving the monopoly of all transportation facilities in any community, it would seem that the American Electric Railway Association has such an opportunity for broadminded treatment of the bus problem that it cannot afford to miss that opportunity by permitting the reactionary spirit of a minority to hold it back longer in its position of partial aloofness.

Just now the principal organizations of the automotive industry and the leading manufacturers of buses are of a mind to co-operate with the American Electric Railway Association to the end that its members, rather than disinterested or antagonistic interests, may have prior opportunity to capitalize whatever usefulness the bus possesses. They prefer to have the railway men take hold of the bus. But if the association cannot soon see its way clear to accept in generous measure this offer of co-operation, and to take the lead in determining where and how the bus can be used, these automotive industry companies and associations will naturally direct their aggressive energies into other channels of development. There, their activities might be more harmful than helpful to present transportation companies. The transportation industries really have too many common interests to permit the few opposing ones to keep them apart, following separate courses.

The JOURNAL believes that the association might well now accept and encourage whole-heartedly the full co-operation and joint effort of the automotive industry associations. Furthermore, to make this movement effective, its membership should now be opened, on some basis, to those legally authorized bus companies which are established and recognized as permanent, dependable transportation agencies operating in a non-competitive way. Some change must shortly be made, anyway, to provide for membership of the bus subsidiaries of railway members, and of the companies where railway has been superseded by bus, but operated by the same company, and hence it is well to consider the whole question.

It appears now that the association can hardly postpone such action beyond the present association year without missing a really wonderful opportunity to bring together into one fold all of the interests pressing for the common objective of developing the transportation facilities available to the public. The basis of bus membership might be that of a bus section of the railway association, as suggested in ELECTRIC RAILWAY JOURNAL for Dec. 2, 1922, page 869, or any other plan that would bring all the transportation companies "into the family."

Unless all the energies of these various associations and railway and bus operating companies can be directed into a harmonious program, the prospect is a half-hearted co-operation at best, and much destructive competition. But with this harmonious program, the future of transportation is inspiring to contemplate.

Typical Brazilian Export Train Consisting of 700 Tons of Cattle and Coffee Hauled Electrically

Savings from the Paulista Electrification Estimated

The Costs of Electric and Steam Operation Over a Period of Five Years Are Analyzed on Brazil's Important Main-Line Railway—Electrification Is Expected to Save as High as 65 per Cent of the Total Operating Cost—Fuel Is a Major Factor

By S. B. Fortenbaugh

Railway Engineering Department, General Electric Company

THE Paulista Railway, Brazil, furnishes an interesting example of a projected electrification where the only considerations involved in the decision to employ electric operation to replace steam were economy in operation and the general improvement of the service. This road recently contracted for the electrical equipment necessary for a 50-km. extension from Campinas to Tatú, in addition to its initial installation between Jundiahy and Campinas. This latest addition is in line with the original policy and intention to extend the electric service as far as Cordeiro, 206 km., and beyond as soon as the exchange situation becomes more nearly normal.

Brazil today produces practically no coal or fuel oil, the high price of imported coal and oil and consequent operating costs having originally led the Paulista company to utilize its natural and easily accessible sources of wood as fuel for the operation of its trains. Today obtaining a supply of wood for engine fuel is a serious and much more costly problem with the Paulista, the net result of this condition of affairs being a decision to push electrification and utilize some of the country's water-power development.

Coal—From an extended series of careful tests and observations it has been found that the ton-miles moved by an average of 7 lb. of coal on the engine tender of a steam locomotive is approximately equal to that which can be moved by 1 kw.-hr. input to the substation. This figure includes, for convenience of comparison, all the transmission and conversion losses inherent to electric operation, as well as the stand-by losses of the steam engine. It is sufficiently liberal and accurate, furthermore, to include all classes of service, miscellaneous switching, etc., and any usual and reasonable variation in the kind and quality of coal.

This figure of 7 lb. represents the amount of coal burned on steam engines to get the equivalent tonnage movement of 1 kw.-hr. delivered from an electric power station. From this it follows that 1 ton (2,000 lb.)

of coal on the engine tender is the equivalent of approximately 286 kw.-hr. of delivered electric power.

Wood—As a result of a survey of Brazilian steam railway practice, it has been determined that the work done by 1 ton of coal is equal, on the different railways, to that accomplished by from 8 to 9.3 cu.m. of wood. Assuming 8.5 as an average figure,

Interior of Louviera Substation, Paulista Railway

Campinas Yards, Where Much of the Freight Classification Is Done

Fig. 1—Comparative Costs of Conducting Trains, All Lines

1 cu.m. of wood burned on the steam engine is the equivalent, in work done, to approximately 33.6 kw.-hr. of delivered power.

During the last twelve years the average annual cost of wood per cubic meter has increased from approximately 90 cents to \$2.15 in 1922. This is equivalent to purchasing electric energy at rates ranging from 2.75 to 6.35 cents per kilowatt-hour. Power has, however, been contracted for by the railway on a long-term basis at approximately 1 cent per kilowatt-hour.

POSSIBLE SAVING OF 85 PER CENT OF FUEL COST

Investigation indicates a possible reduction in the total cost of fuel, based on the existing contract price for electric power, ranging from approximately 40 to 85 per cent for the years 1910 to 1926, inclusive. This is a very large proportion of the total operating expense, and clearly shows the wisdom of the Paulista Company's decision to substitute electric for steam traction. The indications are that the savings effected in fuel alone will more than fully justify the capital expenditure required for electrification.

Table I gives the Paulista's actual operating costs of conducting trains on all lines for the years 1916-1920

Profile of Portion of Paulista Railway Which May Be Electrified Eventually

With completion of the new contract recently announced the section between Jundiáhy and Tatú will be under electrification, constituting half of this route.

TABLE I—TOTAL OPERATING COSTS, PAULISTA RAILWAY, BRAZIL—CALENDAR YEARS OF

	1916	1917	1918	1919	1920
Steam operation (actual):					
Waste.....	\$9,250	\$8,500	\$11,750	\$12,500	\$14,250
Water supply.....	11,750	8,500	10,250	10,000	23,500
Lubricants.....	49,500	51,500	50,500	53,500	86,250
Miscellaneous supplies.....	39,000	46,000	53,500	62,750	77,000
Total.....	\$109,500	\$114,500	\$126,000	\$138,750	\$201,000
Labor.....	352,500	401,500	447,250	586,000	756,500
Fuel.....	710,500	824,000	955,500	1,205,500	2,114,750
Grand total..	\$1,172,500	\$1,340,000	\$1,528,750	\$1,930,250	\$3,072,250
Electric operation (estimated):					
Miscellaneous material.....	\$54,750	\$57,250	\$63,000	\$69,500	\$100,500
Labor.....	235,000	267,750	298,250	390,500	504,250
Electric power.....	241,000	274,750	294,000	297,750	384,250
Maintenance electric equipment.....	75,000	75,000	75,000	75,000	75,000
Grand total..	\$605,750	\$674,750	\$730,250	\$832,750	\$1,064,000
Estimated saving with electric operation:					
Total.....	\$566,750	\$665,250	\$798,500	\$1,097,500	\$2,008,250
Percent.....	48.3	49.7	52.3	56.9	65.3

TABLE II—OPERATING COSTS, PAULISTA RAILWAY, BRAZIL SEVEN MONTHS, JUNE-DECEMBER, 1923

	Cents per Steam	Train-Mile Electric
Fuel or electrical energy.....	37.56	13.09

inclusive, and also the estimated costs for the same period assuming equivalent electric operation. All figures are given in United States dollars on the basis that \$1 equals 4 milreis (4\$000). The estimates are based on a previous detailed investigation of the 1918 service, and for this reason they are submitted as approximate values only, but with the belief that they are well within the probabilities and are reasonably accurate.

An inspection of these data indicates the magnitude of the possible saving. It is largely a question of fuel vs. electric power.

The estimated cost of the operating force, engineers, firemen, train crews, etc., for the electric service has been assumed at two-thirds of the actual value under steam operation. Experience has shown conclusively that the savings to be expected from such items as the increased speed, heavier trains, reduced engine and train mileage are well within the limit suggested. The marked reduction in the cost of miscellaneous material and supplies, including roundhouse charges, the entire elimination of water tanks, ashpits, etc., will effect an estimated saving in these items of not less than 50 per cent in favor of electric service.

In order to complete the picture a liberal amount has been added to the electric service for the operation and maintenance of the required substations, transmission lines and secondary distribution. This is a relatively small proportion of the total expense, and necessarily speculative, but no possible or probable

change in this item can have any material effect on this general comparison of the two methods of railway operation:

ONLY MORE EVIDENT SAVINGS INCLUDED IN THE ESTIMATE

This startling picture includes only the more evident of the direct savings effected by the substitution of electric for steam traction. The indirect savings to be effected by increased speed and capacity, reliability, convenience in operation, etc., are virtually impossible of accurate determination on a purely engineering basis, but of sufficient magnitude and importance to demand the most careful consideration.

The complete change from steam to electric traction on the section between Jundiahy and Campinas, approximately 27.5 route-miles of double track, was made about a year ago and the costs for the first seven months, June to December, 1922, are now available for the first time. The corresponding steam operating costs for the remainder of the Paulista Company's broad-gage lines (a total of approximately 150 route-miles of single track) are presented herewith for comparison. These values have been converted into United States currency of the basis of 7 milreis (7\$000) to the dollar and are therefore approximate only as regards the actual amount in United States currency. The relative values are definite, however, and independent of the conversion factor used. This comparison is shown both graphically and in tabular form. Fig. 1 shows the estimated saving due to electric operations based on actual steam operating costs for 1916 to 1920 inclusive. Fig. 2 shows the difference between steam and electric operating cost for the last seven months of 1922. This comparison, while on a different mileage basis, nevertheless clearly shows how near the estimate made in 1920 came to the actual results now being obtained in the operation of the electrified section of the Paulista.

Fig. 2—Comparative Costs of Steam and Electric Operation, June-December, 1922

All permanent notices for display in the cars of the Montreal Tramways are made of neat blue and white decalcomania. Only in the case of one-day or one-week campaigns are paper posters placed in the cars, as it is believed that dirty, ragged paper notices seriously detract from the appearance of the vehicles.

Traffic Survey in Los Angeles

Street Congestion Is Particularly Severe in Los Angeles, Because of the Narrowness of Its Downtown Streets—Remedial Measures Are Suggested in Report Just Issued—Methods of Determining What Constitutes Adequacy of Service Also Discussed

A TRAFFIC survey has recently been completed in Los Angeles for the Los Angeles Railway Corporation by Joe R. Ong of Piqua, Ohio. Los Angeles, Mr. Ong points out in the early part of his report, is a rapidly growing city, as shown by the accompanying population chart, and its expansion in population and activity has increased the concentration in the central business area. This has introduced complications in many directions, one of which is transportation.

It will be noted from one of the charts that the automobiles in Los Angeles County are increasing at a much faster rate than either population or passengers carried by the Los Angeles Railway. This increased use of automobiles has materially affected the traffic of the Los Angeles Railway Corporation. Statistics of the service given by other public utilities is also charted. All show a larger annual rate of increase in the last four years than in earlier years. In street railway traffic there was, following 1913, a period of actual decrease in passengers carried, and not until 1919 did the traffic exceed that in 1913. Another chart shows, on a logarithmic scale, the passengers and car mileage by months since 1916. It will be noted that the maximum mileage was in the year October, 1917, to October, 1918. In the latter month there was a somewhat belated curtailment, because the traffic began to fall off in 1914. Since 1918 there has been little change in the average monthly car mileage, though, through rerouting, the service was improved in 1920. The irregular sawtooth mileage curve is largely due to the difference in the monthly total of a thirty-one day month as compared with a thirty-day month. The low mileage shown in August and September of 1919 was caused by a strike.

TRAFFIC CONGESTION FROM AUTOMOBILES

There is no magic, says the report, that will relieve traffic congestion. It is a matter largely beyond the control of the street railways. It requires the co-operation of all interests in the community, as well as a vast amount of education. Any solution of the traffic congestion problem will unquestionably curtail the liberty of some individuals. Thus far, the individuals owning automobiles and the merchants, who (mistakenly) believe that their customers are largely automobile users, have effectively blocked sincere efforts to relieve the traffic congestion by non-parking regulations.

The time was when it mattered little in what kind or size of vehicle an individual used to come downtown. It mattered little where, when, in what position or for how long he left this vehicle standing in the public streets. Those days have gone. There are so many automobiles and trucks in the central business area that parking space along the curb for any significant number of them is absolutely out of the question. There is an ordinance against "second line parking" or the parking of a vehicle parallel to a machine that is parked at the curb. This ordinance, the report says, should be strictly enforced and extended so as to clear the

Population and Comparative Growth of Large Cities. At Right, the Population Curves at 600,000 Have Been Superimposed for Comparison

congested area of all automobile parking, leaving curb space for a limited business delivery and pick-up service and for passenger cars just long enough to permit persons to board and alight.

Los Angeles has relatively a small percentage of street area in the congested business section, perhaps a smaller percentage than any other city. There is much interest in street-widening projects, involving millions of dollars, but the least expensive method of widening the streets for the movement of traffic is to eliminate parking. Even single-line parking on certain very narrow streets greatly impedes traffic movement.

Business men in Los Angeles have mistakenly opposed non-parking ordinances, thinking they drive trade away.

Statistics Since 1907 of Population, Passengers Carried on Los Angeles Railway, Use of Other Utilities

Map of Los Angeles Showing Passenger Traffic Flow During P. M. Rush on All Lines of Los Angeles Railway and on City Lines of Pacific Electric Railway

There is not a merchant who could survive on the business he gets solely from customers who park in front of his establishment. The ordinance prohibiting parking in the central congested area, passed in April, 1920, was repealed after a short trial of two or three weeks because of violent opposition on the part of the Broadway Merchants' Association, but they failed to submit actual data in support of their contention or to realize that automobiles parked at the curb do not indicate customers in their stores. Other limited parking ordinances have proved ineffective, partly because they have not been strictly enforced.

Unfortunately, the great mass of the traveling public, being unorganized, is never proportionately represented in hearings and investigations of the traffic problem, and the suggestions of the railway company, whose interests are largely the same as this public, are looked

upon as selfish. Nevertheless, the street car rider is entitled to more consideration than he has had in the past. The street car is the unit best adapted to handle mass transportation, and mass transportation is the problem in the congested areas. Recent observations at the corner of Seventh Street and Broadway during the evening rush hour showed 191 street cars and 668 automobiles using Broadway, but the passengers on the street cars totaled 14,325 and those using the automobiles totaled 1,169. It is doubtful if the actual capacity of the streets for automobile movement would be increased more than 50 per cent if the street cars were eliminated entirely.

An accompanying illustration shows an analysis of the time distribution of street railway traffic by twenty-minute periods. Thirty-two per cent of all inbound travel occurs by 9 a.m., 50 per cent by 12:10 p.m., 75 per cent by 4:40 p.m. and 95 per cent by 8:20 p.m. Only 14 per cent of the total outbound travel occurs by 9 a.m., 23 per cent by noon, 50 per cent by 4:40 p.m., 75 per cent by 6:10 p.m., and 90 per cent by 9 p.m. The map on this page shows the distribution by lines of the outbound passengers between 5 p.m. and 6 p.m. The local city passengers on the Pacific Electric Railway are included in this chart, but are in addition to the 55,600 Los Angeles Railway passengers.

POSSIBLE REMEDIES BESIDES NON-PARKING

During the war a great deal of prominence was given to the question of staggered hours for opening and closing of stores, offices, and factories for the purpose of spreading out the rush-hour travel peak. This matter has been discussed in Los Angeles as a possible aid in the relief of traffic congestion, but an examination of the rush-hour peaks shows that while they are pronounced, they are fairly well spread. There are more than 13,000 passengers per twenty-minute period for four consecutive twenty-minute periods in the morning rush inbound, and in the next period there are possibly 12,000 passengers. To be of any material benefit in spreading out the peak, some of the travel would have to be shifted to near 9 o'clock in the morning, and outbound travel to 6:20 to 6:40 p.m. It is very unlikely that any group of employees can arrange to start work at 9 a.m. and can be held after 6 p.m. The staggered-hour plan is of greatest value, practically, when applied to large industrial concerns employing thousands at concentrated points and served by a limited number of street car lines. Too much should not be expected of it in other circumstances, for its application in offices and stores in a central business district would change the hours of a large number of employees not concentrated under one management.

Passengers Carried and Revenue Car-Miles by Months Since 1916, Los Angeles Railway

Some gain has been secured by double berthing or triple berthing of street cars at congested crossings. Another gain would be obtained by an ordinance requiring automobiles, trucks, and other vehicles to stay off the street car track zone except at street intersections. An aggravating situation arises whenever there is a street parade in the central business area. Vehicles can usually detour, but street cars get little consideration. Relief should be sought through the creation of public sentiment by education and publicity demanding municipal regulation of parades, restricting them to streets which will cause a minimum of delay to the city's transportation service. Co-operation with the other utilities may help to reduce interference to street traffic caused by the opening up of manholes and conduits unnecessarily.

ANALYSIS OF ADEQUATE SERVICE

Too much stress cannot be laid upon the absolute necessity for a systematic and continuous traffic survey by the schedule department. The only commodity the Los Angeles Railway has to sell is service. The service ought to be adequate—commensurate with the fare.

Adequate service has four outstanding features:

1. Sufficient cars to handle the traffic.
2. Cars operated frequently enough to serve a reasonable convenience.
3. Cars that run with regularity.
4. Cars that run with speed, not recklessly but fast enough to satisfy the passenger that he is getting somewhere.

Commenting briefly on these four points it may be said:

1. "Sufficient cars to handle the traffic" does not mean a seat for every passenger at all times. The American people do not expect it nor want it, though they sometimes think they do. During off-peak periods there should be approximately a seat per passenger after making allowance for those who prefer to stand. Standing by preference is still a real factor on the California type car with its closed center section and open end sections, smoking being permitted in the front open section. During rush hours adequate service contemplates cars loaded to comfortable carrying capacity. The number of standing passengers that may be carried on a car and be within the limits of comfortable carrying capacity is determined by the width of aisles, arrangement of seats, amount of unobstructed floor space and the arrangements of entrances and exits.

2. "Cars operated frequently enough to serve a reasonable convenience." During the off-peak hours the travel on many lines is so light that it becomes a question not of how many cars must run to handle the passengers but how infrequently can they be scheduled and still serve a reasonable convenience. The distance of the territory from the business section of the city, or from some other traffic center, the proximity of other lines and perhaps the density of population in the territory served, are some of the factors having a bearing on the required frequency of cars to serve a reasonable convenience.

3. "Cars that run with regularity," not that the time interval between cars should be the same at all periods, but that cars should be on time at the intervals prescribed in the schedules. In other words, cars must be on time, neither late nor ahead of time. Even a minute makes a difference. If the first car is one minute ahead of time, and the second car is one minute

Time Distribution of Travel on Los Angeles Railway, Expressed in Cumulative Percentages by Twenty-Minute Periods

late, and the prospective passenger has just missed the first car, it means that he must wait two minutes longer than the schedule maker intended for him to wait. Not only that, but the second car has a larger load than its share because it followed a time interval two minutes longer than the schedule maker intended. It seems particularly hard to convince old motormen of the disastrous effects on the service of running a minute or two ahead of time.

4. The fourth element mentioned as being a factor in adequate service is speed. "Cars that run with speed, not recklessly, but fast enough to satisfy the passenger that he is getting somewhere." Safety first, of course, but up to a certain reasonable limit it cannot be said that accidents increase with speed; speed is not the controlling element in accidents. Slack time in schedules should be taken out. People living in an automobile age demand speedy transportation.

It is at once apparent that the character of the schedules has a vital bearing on items 1, 2 and 4 referred to above as factors in adequate service. Item 3 is largely a matter of supervision and discipline.

The importance of the schedule department of the electric railway is too often overlooked. It is one of the very vital spots of the railway. Correct schedules can show profitable operation on a given fare and satisfy the traveling public with adequate service. Incorrect schedules on the same fare might show too much service and too little return, or too much return and too little service.

It is not possible to put all lines on the same earning

Cars Scheduled for Operation on Los Angeles Railway, April 8, 1923, by One-Hour Periods Throughout the Day

basis because of the variable factors—such as the length of the line, the speed at which it can be operated, the number of passengers carried, their distribution along the line and their distribution by time periods throughout the day. On a flat-fare and a universal-transfer basis some lines will never show a profit. If an attempt were made to reduce the service on these lines to a point that would materially pull down the expense per passenger it would cause such an overcrowding of cars that the traffic offering itself could not be handled, causing a reduction in revenue as well as a reduction in expense so that the net per passenger would still not show a profit. Such a situation prevails on several lines in Los Angeles, notably those which have a high percentage of transfers. The good lines that show a profit must help carry the poor lines that show a loss.

It must therefore appear evident that an adjustment of service to make all lines show approximately the same profit per passenger or to provide the same number of car-seat-miles per passenger is not the goal to be attained. The auditor's daily analysis cannot be used as the measuring stick of the adequacy of the service unless it has been calibrated by actual traffic observations on each line.

TRAFFIC CHECKING METHODS

It is therefore essential that the schedule department should include a permanent traffic checking staff in order that continuous systematic checking be carried on, and in order that the service may be adjusted to the traffic demands. A tentative program has been outlined for checking all lines not less frequently than

every thirty days, and particular lines as much oftener as conditions may require. The staff should include at least eight regular checkers. Owing to the limited opportunity to get observations on Saturday and Sunday travel, the checking program should include observations every Saturday and Sunday, allowing checkers a day off in the middle of the week.

The traffic checkers must be accurate in their observations and records, and men with proper qualifications should be selected and trained for this work. Traffic checking is not to be looked upon as a place to use disabled or convalescent trainmen. The records of the traffic checkers form the basis for making schedules, and the need for reliability is beyond argument. New forms have been recommended and are in use for recording and summarizing the traffic data.

The number of cars scheduled for operation by hourly periods during the day on weekdays, Saturdays and Sundays is set forth graphically in an accompanying chart. As will be seen, the morning and afternoon peaks in the week-day schedule are very pronounced, the ratio of cars scheduled in the afternoon peak being 2.3 times the number in service at mid-day, and 3.2 times the number in service at 9 p.m.

The Saturday curve has an entirely different characteristic. The cars in service during the morning peak outnumber those used at any other period. The afternoon 5 p.m. to 6 p.m. peak is much lower than that on weekdays but the number of cars in service at noon is substantially greater than for the corresponding period weekdays. On Sundays, there are no peaks. Approximately the same number of cars is in service from 10 a.m. to 9 p.m.

Planning a Car Repair Shop

A Layout for the Upkeep of 1,000 Cars Which Will Turn Out 2.4 Overhauled Cars and 2.2 Painted Cars a Day—Speed in Repairs and Economy of Man-Power Are the Governing Features

*By Henry S. Day**

Railway Department, Westinghouse Electric & Manufacturing Company

THE car repair shop should be planned to give complete accessibility of equipment, cut down duplicate movements and as far as possible make it practicable progressively to route the work attendant on repairs and overhaul. In the present suggested layout no particular attempt at economy of space or facilities or first cost has been made, the main object sought being plenty of room around cars and trucks, good light, all movement of heavy parts performed with cranes, electric trucks or transfer tables, and all work carried on both by shop and stores department where it cannot be hampered by weather conditions. First costs have been set aside to obtain speed in repairs, short shopping periods and reduction in number of men constituting the shop force.

The principal features of this plan are as follows:

1. Three transfer tables which serve any car in the overhaul section or paint shop and make it possible to move any car without interference of operations or other movements.

2. The grouping of departments to eliminate interference and to reduce to a minimum cross-routing and back-tracking of material and parts.

3. Adequate crane service quickly to move material and parts in process of repair to and from car bodies and trucks undergoing overhaul.

4. A receiving and shipping dock for repair parts for carhouses and other departments incorporated as part of the shop.

5. Ample light, ventilation and space.

This layout is based on a total of 1,000 cars, each averaging 3,000 miles per month or 36,000 miles per year. On the basis of a mileage of 48,000 the overhaul period is sixteen months and with a painting period of eighteen months the shop would have to produce 2.5 cars overhauled per day and 2.2 cars painted per day.

Operating the shop on a 300 working-day year and a twenty-five-day month, a fifteen-day shopping period and an eight-day period for painting would require twenty-two cars in the shop for overhaul and twenty-two cars in the paint shop at all times.

Allowing 10 per cent of the equipment out of service

*Formerly superintendent of equipment Kansas City Railways.

for all causes would give forty-four cars for overhaul and painting and fifty-six cars for wrecks and miscellaneous failures. It is believed that this assumed number of cars and the time required for shopping can be reduced, thereby increasing the capacity of the shop and the number of cars available for service.

In the diagram of the shop layout, it is planned that cars to be overhauled will enter the shop on any tracks from 2 to 14, or on track 1, which is equipped with trolley wire, to transfer table 2a. Car spaces on each side of electric crane No. 2 are equipped with stationary air jacks and pits. Unless the car is to be painted it will be completely overhauled in the space originally selected, without further shifting. Trucks will move from under the car on their own power to electric crane aisle No. 1 and by crane to the stripping track. From the stripping track pits crane No. 3 will move the motors to the motor

assembly and the wheels to the wheel track back of the stripping track. Truck frames and parts will go into the lye vat and from the lye vat to the truck overhaul tracks. Wheels will be rolled to crane aisle No. 3 through the wheel shop, and after repairs will be dropped by crane No. 5 at the end of the truck overhaul track, where the truck they are intended for is being overhauled. When the truck is completed it will be moved forward to crane aisle No. 1 for delivery back to the car.

Crane aisle No. 1 serves all overhaul cars, blacksmith shop, welding and reclamation, machine shop, armature room and shipping and receiving dock by transfer. No. 2 serves the wheel shop, where all operations on wheels will be carried on, and the receiving and shipping dock by transfer. No. 3 serves the truck overhaul, motor assembly armature room, and end of receiving and shipping dock.

Cross-movements, as from storeroom to machine shop, or armature room to machine shop, will be made by electric lift trucks, as will material moved to and from mill and paint shop. Cars overhauled in overhaul section A and not intended for the paint shop would move out of the shop when completed to transfer table No. 1a and cars from overhaul section B over transfer table No. 2a and out of the shop over tracks 15 or 16.

Trolley wire is extended above overhaul sections A and B and in the paint shop, but not over crane aisle No. 1 except on track 1. Tracks would be laid from transfer table No. 1a to No. 3a, as the transfer tables

This Shop Layout Is Planned for a Minimum of Waste Movement

would be of the surface type without pit. With trolley wire extending from overhaul section *B* over the transfer table and through the paint shop, cars can move on their own power from section *B* out. Tracks 2 to 14 in section *B* and 2 to 10 in section *A* would usually be reserved for straight overhaul, leaving tracks 11 to 14 in section *A* for wrecks and emergency body repairs, with tracks 15 and 16 in sections *A* and *B* held for hurry-up work on cars sent in for wheel and motor changes.

All tracks in sections *A* and *B* would have pits covered by portable gratings as shown in the accompanying diagram, to act as a floor when the car was on jacks or blocked up, and to be removed when the car was down on the trucks for final connections and inspection. Dummy trucks would not be necessary as the car would leave the location in which it was overhauled on its own completed trucks, which would be painted in the truck overhaul section. If the car was scheduled for the paint shop it would move in on its own trucks and not again be jacked. The objection of painting trucks in the center of the shop would be overcome by spray painting under a portable hood handled by crane No. 1 and connected to an exhaust duct in the floor.

The lighting scheme in the pits is arranged to floodlight the bottom of the car in each position and would do away to a large extent with the use of extension lamps.

This idea is also carried out in the truck overhaul pits, as shown in the accompanying illustration. These are also arranged so that by the removal of the gratings three standing levels are provided. This will afford greater ease to the truck repair men and consequently get more accuracy and speed. Electric tier lift trucks with projecting beds would be used to move brake cylinders, compressors, grid frames, controllers, etc., from the crane way to the exact location on the car body and would also be used to raise apparatus into position for hanger bolts without additional handling.

The entire shop would be floodlighted with the addition of individual lighting on all machine tools. Natural light would be from all available space for sash in all walls and swivel sash in the sawtooth roof.

A suggested organization is shown in the diagram. This differs from the average car-shop organization in that the departments are made up in three groups, each section of each group handling classes of work that are closely parallel. Each of these three groups is under an assistant shop superintendent who is a specialist in at

least one of the classes of work under him, and who has had close associations with the other classes of work in his own group.

These three assistant superintendents would be individually a car builder, a machinist and an armature winder. They should be capable of using the right judgment and supervision over other classes of work very closely allied. This would eliminate a condition which often exists, of a machinist passing judgment on a paint job, which often happens when a machinist becomes a machine shop foreman and finally a general foreman.

With the suggested arrangement the three assistant shop superintendents carry on and are wholly responsible for the production. They report to a higher man who is primarily an executive, who controls the administration and keeps the production force supplied with cars, material and men, and the plant at all times in proper operating condition to perform the work.

Probably one of the first criticisms of this organization will be that it is too expensive and not necessary, but there is no better investment than plenty of the right kind of supervision. Manufacturers learned long ago that well-trained, well-paid specialized supervision was a requisite for successful manufacturing; and this is a parallel that can be drawn by the electric railway operator with sure results.

Machine Sorts Receipts from Locked Fare Boxes

Machine Designed and Built by Kansas City Railways
Handles Cash, Tickets and Tokens in Denominations Up to Half Dollars

By R. S. NEAL

Assistant Superintendent of Equipment Kansas City Railways

THE problem of counting the day's receipts, which became acute when the Kansas City Railways adopted locked fare boxes to receive cash fares, tokens and paper tickets, was facilitated greatly by the use of a machine for separating the various classes of coins and the paper tickets. When the system was changed, the total receipts for the day were put into the money counting room the morning after their receipt, instead of being handled on the same day, as heretofore.

The fare box used is of the non-registering type and a separate check is not made of the individual conductor. The returns are considered as the receipts of the line or division from which they are collected. The

ing belt, which carries them up to the machine proper, dropping them into a small tray immediately under the pipe elbow. At this point, the air suction created by a fan connected to this pipe elbow picks up the paper tickets, but not any of the coins or tokens, carrying them through the fan into a receptacle not shown in this picture. This receptacle is cylindrical and its sides are perforated, which allows the air to escape while retaining the tickets. The coins fall through to the first tray, part of them dropping further into the pan underneath, and the remainder traveling across the tray to the end where they drop down to the next tray. The pan is stationary, and is supported by the frame of the machine.

The trays have a reciprocating motion, traveling on small ball bearings. One of these is marked with the letter A on the photograph. There are four of these bearings which support each tray frame. These trays are perforated suitably for the different sized coins. The whole lot of coins travel across the tray, part of them falling through and the remainder dropping at the end to the next tray. In that way there is a gradual

This Machine Sorts 180,000 Coins and 20,000 Paper Tickets an Hour. At the Right, Part of the Aluminum Tray for Separating Dimes

magazine is removed from the fare box on the car at the end of each day and sent to the money room during the night or early the next day. There is a very large proportion of tickets and tokens. On account of this, it was necessary to design a machine that could handle the tickets and tokens, as well as the money.

A separating machine had been in use for several years, but it was not satisfactory. It had been necessary to change the design several times and also to run the machine much faster than the original plans called for in order to handle all the receipts in the required time.

A complete study was made of the amount of money handled and a new machine was designed embracing quite a number of ideas that had not been used previously. For instance, special ball bearings were used on the traveling trays, which we knew would give absolute satisfaction. It was also decided that, on account of the high speed of the machine, with trays which have a reciprocating motion, it would be absolutely necessary to make this machine of the lightest possible material, taking into consideration that it also must have strength to withstand the severe service that would be given it each day.

The receipts, consisting of tickets, tokens and coins, are emptied into a large trough at the end of the separating machine. They are passed along on the travel-

separation of all the money that was started at the top. The money moves in a zigzag fashion from one side of the machine to the other as it travels down.

A portion of one of these trays, the one for handling dimes, is shown in the diagram. This tray is made of hard drawn aluminum, with holes of exact size to allow coins of the desired denomination to drop through, while larger ones must travel across the tray. The tray is 11½ in. wide and 23½ in. long.

The stationary pans into which the tokens or coins drop are removable. They usually are removed after each batch of money is put through the machine, and are emptied into the machines for wrapping and counting the coins.

The machine itself is driven by one ½-hp. shunt-wound motor, and the fan which picks up the tickets is driven by a ¼-hp. shunt-wound motor.

In order to be absolutely protected two of these machines were put through the shop at the same time. The complete cost of these machines, including the motors and all material, was approximately \$700.

In actual work, this machine handles in two and one-quarter hours 45,000 tickets, 275,000 tokens, 11,000 dimes, 90,000 pennies, 26,000 nickels, about seventy-five quarters and very few half dollars. It can be readily seen that a great saving is made in labor by the use of this machine.

Electric Railway Passengers Increased 12 per Cent in Five Years

Preliminary Census Figures Compare 1922 with 1917—More Complete Statistics for Eight States Show a General Gain in Revenue, Although Track Mileage Decreased in Places

THE generally healthy condition of the electric railway industry throughout the United States is shown by the preliminary census figures recently announced by the Department of Commerce. Revenue passengers carried during the year 1922 numbered 12,665,300,050, as compared with 11,304,660,462 in 1917, when the last similar survey was made. This is an increase of 12 per cent for the five-year period, and an increase of 32.7 per cent compared with 1912, when the number was 9,545,554,667.

The total electric railway mileage in the country, however, as reported to the Census Bureau, has been somewhat reduced during the last five years. The survey shows that the miles of single track operated in 1922 aggregated 43,934 as compared with 44,808 miles in 1917, a decrease of 2 per cent. When the latter figure is compared with that for 1912, however, an increase of 7.1 per cent for the ten-year period is found. The largest recent trackage losses have occurred in Massachusetts and Ohio. In Massachusetts there was also a reduction in the number of passengers carried, but

in Ohio the number increased more than 60,000,000 in spite of the smaller track mileage.

In most states where the trackage is less, there has been a change in operating methods, with consequent elimination of duplicate mileage, rather than suspension of service. This is shown by the fact that the largest falling off in trackage occurred in those states where the electric railway has been most highly developed, such as Pennsylvania, Ohio, Illinois, Massachusetts, Indiana, New Jersey, etc., whereas most of these states showed a decided increase in the number of revenue passengers carried.

Besides the encouraging aspect of the situation illustrated by the increase in traffic, there is also the fact that the railways in general had the advantage in 1922 of higher rates than they had in 1912, and this has further augmented their revenue. In spite of higher costs and higher taxes, the net income after all deductions has in many cases been more than 100 per cent greater in 1922 than it was five years before. These facts, therefore, point to the conclusion that the electric railway industry in the United States is today in a firmer position than ever before. More detailed figures for the individual states released follow:

South Carolina.—The figures show a slight decrease in track mileage, which was accompanied by a decrease of 21.4 per cent in the number of passengers carried. However, on account of fare increases, gross railway operating revenues increased 21.5 per cent, aggregating \$3,368,058 in 1922 as compared with \$2,772,841 in 1917, but owing to a more rapid increase in expenses net income decreased from \$563,791 in 1917 to only \$2,009 in 1922.

The Readers' Forum

The Weekly Pass as a Simple Zoning Expedient

UNITED RAILWAYS OF ST. LOUIS, MO.

Oct. 16, 1923.

To the Editors:

Almost any street railway man will admit that the distance fare is right in principle, that it is more equitable between different passengers than the flat fare, and that from the company's standpoint it has the advantages of getting more revenue from the long-haul passenger without driving him away and of putting the cars in a better position to compete with the sidewalks and jitneys for the short-distance business. With all these advantages, however, distance or zone fares have been adopted in very few cities. Managements have hesitated to urge them on account of the difficulties introduced in fare collection. Doubtless, too, they would meet with opposition from a considerable part of the public.

The distance fare principle can, however, be introduced to a large degree without increasing fare collection troubles, and probably without marked public opposition, by means of the weekly pass. The method is applicable to any surface system on which fare collection is entirely pay-as-you-enter or entirely pay-as-you-leave and to any rapid transit system which collects its fares at the entrance to the stations. It is simply to divide the single fare area, which will remain a single fare area so far as cash and ticket fares are concerned, into pass sections, and issue a distinct pass for each section, good for transportation if presented within that section. Then the holder of a section pass could ride at will within the limits of the section designated. If he made a trip between a point within the zone and one without, he could use the pass only one way, and on the opposing trip would be obliged to pay the full cash or ticket fare, unless he also possessed a pass good in the section at the other end of the trip. If he had a pass good anywhere on the system he would not of course have any zone passes, and if such general passes were available there would be no point in his having two section passes, since the price of the latter would presumably be at least half of that of the former.

The section pass would then be a short-haul pass so far as its own section was concerned. On long trips it could be used only one way, and in consequence could be used only half as often as a pass of general acceptability. In view of these facts it could be sold at a less price than that required for the general pass, and so would help the company to get the short-haul business in spite of a high cash fare and a high-priced general pass.

In a circular city with its business district in the center, it might be well to have five primary sections, as follows: Central, northern, eastern, southern, western. The boundary between the central and other sections would be perhaps half way between the business center and the fare limits. Overlapping sections might be provided to care for short rides between points in adjacent primary sections. Or the primary sections might be made to overlap. The number of sections, overlapping or not, which can be provided is limited

only by the possibility of printing the respective passes so that the conductors can readily distinguish them.

The plan here outlined is particularly applicable to systems in cities of large area, where the average haul is long, where the fare is consequently so high as to discourage short-haul riding or drive it to competitors and where a low-priced general pass would cut too deeply into the revenue derived from the long-haul business. In cities where these general conditions do not obtain, it may be found useful under some peculiar conditions.

This plan is believed to be original with the writer. Steady reading of the *ELECTRIC RAILWAY JOURNAL* has failed to bring to his attention any such suggestion. It is offered to the industry in the hope that it will prove useful in solving some of the many problems with which urban railways are confronted.

LAWRENCE H. DOOLITTLE.

Is the Electric Railway Industry Tottering?

NEW YORK, Oct. 29, 1923.

To the Editors:

Within the last five years, according to the Census Bureau, there has been a net loss of nearly 900 miles of electric railway track, or about 2 per cent. Is the electric railway industry tottering?

No. This is not a sign of tottering. Every industry gets overbuilt at times, and of course there has been much track that ought never to have been built.

Other statistics recently published by the Census Bureau show that between 1917 and 1922 there was a loss of traffic by electric railways in nineteen states of the Union. Is this an indication of tottering?

No. It will take more than this to make the industry totter. These passengers have largely deserted temporarily for an extravagant means of transport, namely, private automobile. This tendency is bound to have limits and is bound to correct itself to some extent.

Out of 850-odd electric railways in the United States and Canada only seventeen competed this year for the Coffin Award. Is this significant?

Yes. The industry is certainly dead from its ears up. Here is a practical proposition devised by the most enlightened and practical men in the industry. To qualify, it requires nothing but every-day good management. Or, rather, there is nothing required which should not be done by every management every year to improve its property, yet only seventeen tried. Have the other 833-odd "lain down," or have they failed in all their endeavors to make improvements, or are some of them too modest or lazy to compete? It may be that many have perfect properties and hence have no chance for improvement. It may be that many are too poor. It may be that many were really too busy to prepare elaborate briefs.

Is it too much to expect that every electric railway should go after this award? There is not a motion required that a good manager should not make and that will not show favorably in the income account. It is not necessary to expend capital. The award is made for human effort. The small roads need not be backward, for, like the parable, the man with two talents will not be scorned. What is wanted is good, active thinking, and good thinking action. When the industry gets such stuff, it will not totter. It may have to take some hard cracks, but it will take them standing up.

A FRIEND OF THE INDUSTRY.

Report of A.E.R.A. Committee on Valuation

Weight to Be Given Various Evidences of Value and Study of Present Price Trends Are Principal Aspects Considered—Committee Presents Bases for Determining "Present Value"—Report Is Printed in Full as Adopted by Atlantic City Convention

IN 1915 the committee on valuation presented a report on the general problem of valuation. In 1916 the committee presented a bibliography of valuation literature complete to Jan. 1, 1916, and a code of definitions of terms used in valuation work. For the years 1917-1918-1919 the committee reported that in its judgment fair value should include original cost, appreciation and going concern value, and that in those cases where original cost was not available reproduction cost new with proper overheads should be used as a basis, to which should be added going concern value and development cost. The committee also recommended that when a property was in good operating condition and properly maintained no deduction should be made for accrued depreciation in determining rate-making value.

In 1920 the report of the committee further developed the subjects of "cost of reproduction new" and "going value." The 1921 report discussed the rate of return and the importance of placing this rate high enough to attract new capital. The use of the yard stick method in appraisals was advised. Last year the committee further discussed and commended the use of the yardstick method.

For the current year the committee has devoted itself to a study of the weight which should be given to the various evidences of value and to a study of the present price trends. The report in full follows. The conclusions and recommendations are here summarized:

CONCLUSIONS

1. Courts of last resort have up to this time uniformly held that the basis of rate making is the present value of the property, that the ascertainment of that value is not controlled by artificial rules, is not a matter of formulas, but that there must be a reasonable judgment having its basis in a proper consideration of all relevant facts, and, in recent cases, that in the determination of present value the enhanced prices of labor and materials cannot be ignored, and further that present value is not necessarily either "prudent investment," "original cost" or reproduction cost at abnormal prices.

2. That trend prices based on pre-war price investments cannot be deter-

mined with sufficient accuracy to be used as the basis of valuation.

3. That a careful study of present economic conditions and the underlying causes of variations in the purchasing power of money do not indicate any early return to pre-war price levels, but rather a continuance of present prices with minor fluctuations and possibly a slow decline until the curve of general commodity prices again approximates close'y its general trend as established in the period from 1899 to 1915, inclusive, and that, in particular, the conditions governing electric railway construction costs indicate that the curve which represents them will not for ten or fifteen years approximate the trend curve determined by the pre-war period, or, in other words, that construction costs for the next decade at least will remain well above rather than below 150 per cent of corresponding costs in 1913-1914.

RECOMMENDATIONS

1. Our member companies, in approaching the question of valuation before a commission or other regulatory body or before a court, should submit full evidence at least as to original cost, present-day reproduction cost, present and probable future trend of unit costs and direct testimony as to present-day fair value. They should endeavor to reach with the regulatory body a fair, equitable conclusion as to a reasonably stable level of unit costs and an equitable working figure as to such unit costs, if any, as may be admittedly still unstable.

2. In the case of properties in serviceable condition and adapted to their purpose, our member companies, in view of controlling court decisions, should take a firm stand for a present plant value approximately equal to reproduction cost at stable unit prices as above and for a fair return upon that value, to which there should of course be added going concern value and other non-physical elements.

WEIGHT TO BE ATTACHED TO VARIOUS EVIDENCES OF VALUE

The Supreme Court of the United States in the leading case of *Smyth vs. Ames* established the principle that a public utility is entitled to receive from the public a fair return upon the fair value of its

property and, the court, though it did not establish any definite rule for the determination of fair value, listed certain evidences of value which in its opinion should, with others, be considered and weighed before fair value can be determined.

The most important evidences of value are:

First—Original cost of construction plus subsequent net capital expenditures.

Second—Amount and market value of stocks and bonds.

Third—Present as compared with original cost of construction.

If the fairness of any particular set of rates is under consideration there must, of course, also be considered the estimated earnings of the utility under the proposed system of rates and the probable cost of operation.

In the gradual development of the theory of valuation since the case of *Smyth vs. Ames* the various state commissions, state Supreme Courts and various Federal courts, including the Supreme Court itself, have exhibited a growing tendency to ignore the second of these evidences of value and to focus attention more and more upon original cost plus subsequent net capital additions and reproduction cost as of the time of the inquiry.

During the pre-war period the difficulty or even the impossibility of determining the original cost of many properties, together with the fact that in many cases reproduction cost as of the time of the inquiry was not widely different from the normal construction cost as of the time when the property was originally built, led frequently to reliance in large degree upon cost to reproduce, using the unit prices as of the time of reproduction, unit prices averaged over a term of years prior to the valuation or unit prices determined by careful study of the trend of prices for the various basic commodities involved.

The coming of the war changed the situation materially. Wages and commodity prices rose by leaps and bounds, carrying up with them cost of reproduction at current prices, until, at the peak, cost of reproduction at current prices exceeded original cost or pre-war reproduction cost by 100 per cent or more. Regulatory bodies, therefore, found themselves suddenly confronted by two problems. In valuing a new property, which of the two measures of value, easily comparable in the pre-war period but now widely divergent, should be given controlling weight? In valuing a property which had previously been valued, should the new valuation be limited only to subsequent capital additions or should the whole problem

be reopened and reconsidered on the basis of present-day conditions?

The problems thus presented were complicated by the fact that several minor questions, on the answers to which the main question must necessarily depend, could not be answered. For example, was the price increase permanent or merely temporary? If the former, had we entered upon a new price level, and if so, how high was it? If the latter, would prices promptly return to their pre-war level or would this return be long delayed?

Under these conditions we would naturally expect to find a wide divergence between the various regulatory bodies as to the weight which should be attached to the various evidences of value. This expectation is fully realized when we make a study of recent commission decisions. It is doubtful, in fact, whether any two state commissions hold exactly the same point of view toward the problem.

As indicated above, they pay practically no regard, however, to the amount or market value of securities, and the various differences which are found between them grow chiefly out of their treatment of the elements of original cost and reproduction cost.

Disregarding minor differences, however, it is possible to group the commissions under certain general classifications as listed below:

GROUP I. REPRODUCTION COST CONSIDERED

Class A.—Commissions belonging to this class refuse to recognize either original cost or reproduction cost as of the present date as controlling and have no definite method of relative weighting for these two evidences of value.

In general, they consider all evidences of value which are presented and all other matters or circumstances which they feel have any bearing upon the case, and then announce a value which they believe to be the fair value under all of the circumstances. Certain of the decisions rendered by the commissions in this class lean strongly toward original cost so far as the final value is concerned, and others lean strongly toward reproduction cost under present-day prices, but the commissions themselves disclaim any recog-

nition of either element as, in general, controlling.

Class B.—The commissions in this class regard reproduction cost under present-day prices or those probably in force in the period while the rate is in effect as dominant or controlling.

Class C.—The commissions in this class recognize as dominant a reproduction cost based not upon present prices but upon average prices over a five-year or ten-year period prior to the time of the valuation.

Class D.—The commission in this class regards the investment value as controlling for new properties, but when a property is more than ten years old the commission is disposed to follow reproduction cost based on unit prices for the ten-year average.

Class E.—The commissions in this class hold that since rates are to be effective for a future period they should be related to the value as of that period, and that therefore fair value for rate making is reproduction cost with unit prices as of the time during which the rate will probably be in effect.

GROUP II. REPRODUCTION COST IGNORED

Class F.—The commissions in this class regard original cost or, in some cases, historical reproduction cost, by which they mean a reproduction cost using for each unit so far as possible the normal cost at the time when it was supposedly installed, as dominant or controlling.

Class G.—The commissions in this class hold that fair value should be the prudent investment.

GROUP III. SPECIAL THEORIES

Class H.—The commissions in this class use what is sometimes termed the split inventory method. Under this method property installed prior to the war is taken at its fair pre-war value, either as valued at that time by a commission or usually on a reproduction cost as of a definite date or as averaged over a period. To the sum so obtained there is added the actual cost of war and post-war additions, and the sum so secured is taken as fair present-day value.

Class I.—The commissions in this class vary the theory of Class H by

allowing on the pre-war property an appreciation for change in price scale. This theory has been worked out most fully by the state of Virginia, which has built a definite working formula for valuation cases.

Class J.—The commissions in this class have taken the position in dealing with applications for revaluation that present fair value is the value formerly found plus the net capital additions to date.

Class K.—The commissions in this class have no general policy.

SUMMARY OF COMMISSION DECISIONS

The committee has digested the commission and court decisions as reported in P. U. R. for the years 1920, 1921, 1922 and 1923 to May and classified them under the above plan. The results, so far as the commissions are concerned, are shown in condensed form in Table I, giving for each year the number of commissions whose reports seem to put them in the class indicated and the percentage of the commissions in the class to the total number of commissions reported. Fractions were used where the decisions for a given year seemed to fall in more than one class.

The committee then wrote to each commission asking for an expression of opinion on this question. A number of commissions have made no valuation rulings and others felt that they should not express themselves except through official rulings, but twenty-six of the commissions replied with sufficient fullness to enable the committee to classify them.

The significant thing in this tabulation is the evidence it affords of a steady drift toward Group I and particularly toward Class A.

STATE COURT DECISIONS

The decisions of the state courts of last resort seem to show less variation than the decisions of the commissions, although there is, of course, a much smaller number of adjudicated cases.

Thus we find in Class A the Supreme Court of Illinois, the Supreme Court of Kansas, the Supreme Court of Missouri, the Supreme Court of New Jersey, the Supreme Court of Appeals of Virginia and the West Virginia Supreme Court of Appeals.

Still in Class A, but with a strong leaning toward Class F, we find the New York Supreme Court.

In Class B we find in 1920 the Michigan Supreme Court.

In Class J, on the question of the treatment to be given to a previous valuation, we find the Washington Supreme Court.

FEDERAL COURTS

The Federal courts also incline strongly toward Class A, as will be seen by an examination of the following cases:

United States Court of Appeals of the District of Columbia in re Potomac Electric Power Company vs. Public Utilities Commission, P. U. R. 1922 B, 680.

United States District Court of Min-

On the other hand we find in Class B:

United States District Court for Missouri, in St. Joseph Railway, Light & Power Company vs. Public Service Commission, P. U. R. 1921 A, 540.

GALVESTON ELECTRIC COMPANY CASES

Galveston Electric Company vs. Galveston reported in P. U. R. 1922 D, 159, has been perhaps more frequently misinterpreted than any other recent case of the Supreme Court. The company and the municipality both abandoned the evidences of value approved by the case of Smyth vs. Ames and attempted to determine fair value on the reproduction method, using not current prices but the prices assumed as average prices for the future.

The value had been reached in the lower court, not by weighting the various measures of value recognized in Smyth vs. Ames, but by assuming that in the post-war period the country would settle down on a new price plateau and that the company should be allowed reproduction value determined by the unit prices of this new plateau.

The master and the lower court set this new plateau 33½ per cent above the pre-war level, while the company contended that it should be from 60 per cent to 70 per cent above the pre-war level.

Both contestants appealed on this point and others to the Supreme Court of the United States, and the question presented to that body was practically this:

Both contestants having agreed to ignore the usual evidences of value and to determine value by an estimate or prophecy as to future economic conditions, is there any thing in the record or anything of which the court should take judicial notice which will make the action of the master in refusing to prophesy a level above 33½ per cent reversible error? The United States Supreme Court held that there was nothing which constituted reversible error in this action of the master, but it did not express an approval of the method or express any opinion as to the accuracy of the master's or the company's costs.

SOUTHWESTERN BELL CASE

The case of Houston vs. the Southwestern Bell Telephone Company, reported in P. U. R. 1922 D, 793, unquestionably takes the United States Supreme Court out of Class F, but it does not, as has been sometimes stated, put the Court in Class B. The decision is an unequivocal assertion that the company is allowed to earn a fair return upon its present value or upon the value of the property used and useful at the time when it is used, but there is nowhere in the decision any assertion that present-day reproduction cost and present-day value are identical.

The decision of the United States Supreme Court in the case of Missouri

vs. Public Service Commission, dealing with the valuation of the Missouri properties of the Southwestern Bell Telephone Company, was handed down on May 21, 1923.

In this case below the company had put in a valuation showing a reproduction cost as of June 30, 1919, of \$35,100,471 and an actual cost as shown by the books of \$22,888,943. The latter figure, however, did not include the cost of establishing the business, included in the former figure at \$5,594,816.

The commission had not valued the entire property of the company, but had valued the property at three of the exchanges in the state in 1913, 1914 and 1916, the last of these representing, however, less than 9 per cent of the total value of the three exchanges. The company's valuation was made up by exchanges and it was therefore a simple matter to compare the commission's value on these three exchanges with the company's value on the same property.

The commission added to its earlier value on the three exchanges the net capital additions and determined the ratio of the total so secured to the company's reproduction cost. This ratio they applied to the company's reproduction cost of the entire property and reached a value of \$20,350,000 or, on a similar process for reproduction cost less depreciation, \$20,400,000. This latter figure was fixed as the tentative value of the property.

It is evident that this, as the Supreme Court says, undertakes:

'to value the property without according any weight to the greatly enhanced costs of material, labor, supplies, etc., over those prevailing in 1913, 1914 and 1916.'

The court then emphatically reaffirms its former ruling that present value and not cost is the determining factor and repudiates the methods that are followed by the commission in the following terms:

"It is impossible to ascertain what will amount to a fair return upon properties devoted to public service without giving consideration to the cost of labor, supplies, etc., at the time the investigation is made. An honest and intelligent forecast of probable future values, made upon review of all the relevant circumstances, is essential. If the highly important element of present costs is wholly disregarded such a forecast becomes impossible. Estimates for tomorrow cannot ignore prices of today."

From the viewpoint of the Supreme Court, therefore, there was evidently no finding of "present value," but there was in the record testimony (with no substantial evidence to the contrary) that the value was at least 25 per cent in excess of that found by the commission. The Supreme Court found that a value of \$25,000,000, slightly less than that fixed by this uncontroverted testimony, would make the rates ordered by the commission confiscatory and therefore reversed the judgment of the lower court sustaining the commission.

This decision did not fix the value of the property of the company at \$25,000,000, but merely determined that it was not, as judged by the record, less than that. It did not determine the weight to be given to reproduction cost, but did determine that it cannot be ignored. Finally, it is a demonstration of the importance of presenting testimony as to "present value" as distinct from costs, whether original or reproduction.

The case, however, is particularly important because of the dissenting opinion filed by Justices Brandeis and Holmes, which is a strong presentation of the prudent investment theory.

ATLANTA AND BLUEFIELD CASES

The Atlanta Gas case and the Bluefield Water Works case were both decided on June 11, 1923.

To those who have regarded the Southwestern Bell Telephone case as holding that present-day reproduction costs are a controlling measure of present value the Atlanta Gas case came as a distinct shock, and many critics, including one justice of the Supreme Court itself, insist that these two cases cannot be reconciled. To those, however, who regarded the Southwestern Bell Telephone Case as holding merely that present-day reproduction prices must be considered and given reasonable weight, it does not seem impossible to reconcile the Atlanta Gas decision with that in the Southwestern Bell Telephone case.

In the Atlanta case the commission below claimed that it had given full consideration to present-day reproduction costs. Both the District Court and the United States Supreme Court found that "the opinion of the commission evinces a full and conscientious consideration of the evidence."

The lower court also held that the commission's statement of the applicable rules of law was sound, and that, while it might differ from the commission as to the application of those rules, the resulting changes in the final figures would not be sufficient to justify a reversal.

The commission in dealing with this case had taken the value of the portions of the plant in existence in January, 1914, and allowed original cost or reproduction cost as of that date undepreciated. To this sum it added \$125,000 as a recognition of the appreciation in land values, and also added approximately \$1,000,000 of additions made during the period from January, 1914, to September, 1919, at actual cost, although since the hearing came in the last three months of 1921 the strict application of the reproduction cost theory would have shown a reproduction loss upon a part at least of this investment.

The lower court held that this action in this particular case resulted in a figure which gave sufficient weight to present-day unit prices, and therefore sustained the commission, an action which the United States Supreme Court refused to reverse.

In the Southwestern Bell Telephone

case, on the contrary, the commission's figures were based upon 1914 reproduction costs depreciated, no allowance was made for the appreciation of land during the war period, and the additions were entered at cost, which, since the hearing occurred at the end of 1919, was below reproduction cost as of that date. There was therefore no evidence of any consideration whatever of present-day unit prices in the determination of value, and the decision was accordingly reversed by the Supreme Court.

In the Bluefield Water Works case the commission ignored reproduction at present-day prices, ignored testimony as to present fair value, fixed a value below its own revision of the company's reproduction costs on pre-war basis depreciated, below its own engineer's reproduction costs at 1915 prices depreciated, and only 1 per cent to 2 per cent above a depreciated cash investment.

Under these circumstances the Supreme Court held that there had been no recognition of present-day costs in the determination of the value, and therefore reversed the commission.

GENERAL SUMMARY OF DECISIONS

If we attempt to examine the various conclusions reached by state commissions and Federal courts it becomes evident at once that there is no uniform rule and apparently no tendency toward a uniform rule by which one may determine the weight to be attached to the various evidences of value. If we attempt to generalize for the country as a whole, the conclusions which we can reach are extremely limited. They are, perhaps, as follows:

- (a) The fair value of *Smyth vs. Ames* is present value.
- (b) Original cost is not controlling.
- (c) Reproduction cost at current prices is not controlling.
- (d) No one of the various set rules by which commissions have reached reproduction cost on the basis of unit prices averaged over a period of years (Class C), or have reached fair value by a split inventory method (Class H), or by a combination of pre-war costs appreciated and subsequent capital investment, has been approved by any court of last resort. It is true that decisions resting upon these theories have been approved, but the approval has been an approval of the decisions because the formula took into consideration all of the evidences of value, rather than an approval of the formula.
- (e) The so-called "prudent investment" theory, the "reproduction cost of equivalent plant" theory, and the "reproduction cost of unit prices during the time the rate will probable be in force" theory, while mentioned approvingly by various commissions, have not been approved by the courts.
- (f) A commission which adopts a basis of value which clearly and demonstrably shows that it has considered and given reasonable weight to all of the elements of value seems to run little danger of reversal by the courts.

If we forget for a moment the deci-

sions of the various commissions and courts and attempt to approach this subject from a practical economic viewpoint, we find at once that there are two distinct methods of approach to this important question, and that utilities and municipalities alike have shifted from method to method as change in economic conditions made first one and then the other advantageous to their particular ends.

COMPARISON OF VALUATION METHODS

The first method asks for a return on the investment. It is argued that one of the prime requisites for a successful public utility in a growing American community is a constant and adequate supply of new capital; that new capital must be secured either upon a speculative or upon an investment basis; that the development of the theory of regulation by state and Federal governments has destroyed any chance of a speculative reward, and that therefore the business must be put upon an investment basis or have its supply of new capital dried up. But if the business is to be put upon an investment basis, the investor must be assured that the dollar which he invests in the business will remain in the business subject only to the chance of loss by mismanagement or to loss by such change in the prosperity or in the life and habits of the community as will make it impossible for the business to earn a fair return upon this investment at any charge under which business is possible.

In other words, the investor must be assured that the dollar which he places in the business will not be scaled down because later it proves possible to replace the business or equipment for a less sum. If the investor is given this assurance, however, he must consent on his part that he will not claim any increase in the dollar invested because of a changing scale of construction costs.

There still remain, however, the speculative elements of premature obsolescence, change in population drift or decrease in the investor's return due to a general change in the purchasing power of the dollar. Theoretically, these speculative elements may be compensated by allowing an amortization of obsolescence and by adjusting the rate of return to the change in the purchasing power of the dollar. The fact, however, that the obsolescence may be too great to be amortized by any rate economically possible, and the difficulty of securing commission or court approval of a rate of return which would compensate for the change in the purchasing power of the dollar, still leave a large speculative element in the business, which it would seem impossible to remove by anything short of an absolute governmental guarantee.

The investment theory as commonly discussed is, however, vitally weak in that investment is always expressed in terms of mixed dollars. Dollars invested before the war have an entirely different meaning and weight from dollars

spent in the past five years, but they are all thrown in together on the books. The business of every day life is done in terms of the money of today and when the amount of an investment is stated it should be stated in terms of the money of today. The statement of an unweighted mixture of different kinds of money has not true meaning.

The second method does not look to a return upon investment, but to a return upon property or a return upon value. Logically, of course, if a man is to look for return upon value, it must be the value which he now has, not the value which he had at some time in the past or the value which he is to have at some time in the future, and the adherents of this method face at once the prime difficulty in its application, the necessity of determining present value.

If we eliminate for the moment the consideration of the value of the going concern and limit our thought to the idea of plant value, and if we measure value as in ordinary commercial transactions by the price or amount of money at which there will be a relatively free movement of property between a group of buyers and a group of sellers in an open market, neither group being under the compulsion of economic necessity, certain basic facts at once become evident:

First—Present value is not necessarily represented by cost. It may be above cost if construction prices have increased or if drift of population or other phenomena of community development have given an enhanced value to the location of the plant; it may be below cost if construction prices have decreased, if a change in the art has reduced the relative efficiency of the plant, or if drift of population or other phenomena of community development have left the plant in a disadvantageous situation or have destroyed or lessened the demand for its service.

Second—Present value is not necessarily represented by reproduction cost at present prices or at prices averaged over any number of years. If construction costs are temporarily abnormally low the seller will withdraw the property temporarily from the market, or the buyer, convinced that he could not complete the construction during the period of low costs, will offer a sum in advance of reconstruction cost at current prices. If reconstruction costs are temporarily abnormally high the buyer will withdraw from the market unless the seller makes a concession in price in order to move the property. If population drift has left the plant in a disadvantageous situation, if a change in the public habit has lessened the demand for its service, or if the plant itself is in bad condition, the seller must make a concession below reproduction cost in order to move the property.

Third—But if the plant is reasonably adapted to its purpose or by extensions and additions can be made so without scrapping any appreciable portion of it as it now exists, if it is in

good repair, if there is a reasonable market for its service, and if construction costs (including therein cost of land and cost of money) are reasonably stable, present value as defined above is equal to or closely approximates reconstruction cost at current prices.

Abstractly considered, the debate between the adherents of these two methods of approach to the problem of fair return might continue indefinitely, since much is to be said in favor of each of them, but when we come to consider the subject from the practical side a new element enters.

The state or the municipality claims the right to regulate the charges made by a utility and the natural tendency of such regulation is downward. The only limit to this downward regulation is to be found in an appeal to the sense of fairness and good business judgment of the legislative authorities or, when this is not successful, to the restraining hand of the courts.

The power of the courts to restrain a legislative body is found only in the fundamental law, the constitutions of the states or the nation. An examination of these documents reveals the fact that the only restraints on such legislation lie in prohibitions against taking private property for public use without due compensation, or in the prohibition against depriving any person of his property without due process of law, which is construed to mean without a determination and payment of an adequate recompense. It follows, therefore, that so long as the courts continue as at present to hold that the taking of the property for public use comes at the time of the establishment of the rate, rather than at the time the property is first devoted to the public service, the "return on investment theory," whatever may be its economic virtues, has no legal standing or foundation in state or Federal constitutions and that the utility which attempts to base its rights upon this theory will find itself deprived of its final protection against legislative aggression, particularly in view of the recent action of the United States Supreme Court.

Even if the courts should in the future adopt the basis of valuation described under the heading of investment or original cost theory, they could not adequately protect the utilities at times when the price levels may have changed to a point where the property could be duplicated for any material amount under the original cost, because the courts could not, in the absence of appropriate legislation, prohibit either private or municipal competition.

We recommend, therefore:

1. Our member companies, in approaching the question of valuation before a commission or other regulatory body or before a court, should submit full evidence at least as to original cost, present-day reproduction cost, present and probable future trend of unit costs, and direct testimony as to present-day fair value. They should endeavor to reach with the regulatory body a fair, equitable conclusion as to

a reasonably stable level of unit costs and an equitable working figure as to such unit costs, if any, as may be admittedly still unstable.

2. In the case of properties in serviceable condition and adapted to their purpose, our member companies, in view of controlling court decisions, should take a firm stand for a present plant value approximately equal to reproduction cost at stable unit prices as above and for a fair return upon that value, to which there should of course be added going concern value and other non-physical elements.

We recognize the fact that this conclusion, if followed, may be said to introduce into the public utility business a speculative element, which we regret, and that it may call for revaluations from time to time, but we recognize the fact that no agreement, even though it be made between the utility and the regulatory body, would be binding upon the successors of the present personnel of the latter, and that under the existing condition of the law such an agreement would not be enforced by the courts in the event of a marked change in price levels. The utility which enters into such an agreement, therefore, merely bars itself from any advantage in the case of an increase of unit costs, without protecting itself against the disadvantage that follows from a decrease of unit costs. Whatever our ideas may be, therefore, as to the soundest economic theory, and the desirability of maintaining the securities of our companies in the investment rather than in the speculative class, the protection of the properties in our care compels us to follow the only theory by which we can retain judicial protection against political aggression.

PRICE TRENDS

The 1922 committee on valuation embodied in its report a recommendation "that a study be made of price trends and a method worked out by which they may be used in determining the fair value of the property useful and used by the company at the time of the inquiry." In undertaking to carry out this recommendation the present committee understands that the "trends" in question had reference to pre-war prices and their general upward movement during a period of about twenty years preceding the World War, and that the recommendation was prompted primarily by the method adopted in a number of appraisals made during the period of war disturbances of using, not prices current at the time of the inquiry or at the time of actual construction, but those which might have prevailed at the time of the inquiry if the war had not occurred and pre-war price trends had continued. In accordance with this understanding the "trend prices" discussed herein are the prices obtained by projecting the trend of pre-war prices through the war period to the present or some future date.

The object which engineers who have used trend prices have sought to attain

was doubtless to arrive at a value higher than pre-war levels, which some authorities sought to retain, yet lower than would be obtained by using current prices which, until two years ago, were undergoing violent fluctuations and which were commonly rejected by regulatory commissions as abnormal. There has been comparatively little recent use of trend prices in valuation work, but in a 1922 rate case in which the company's appraisal embodied such prices the commission pointed out the difficulties of determining correct trends and the errors which would result from lack of suitable skill and judgment in their selection.

It is the opinion of the committee that it should not report upon this subject without giving careful consideration to price movements and their causes covering a considerable period of time, and that it may include in its report comments as to current price movements and opinions as to future tendencies, as well as such statements as to past trends as it believes may be helpful. The subject, therefore, logically divides itself into three parts: (1) Pre-war prices; (2) war period prices; (3) future prices.

PRE-WAR PRICES

There are available to the committee several carefully prepared wholesale price indexes which conform more closely to the cost of public utility construction than do other general compilation of prices. The most commonly used of these indexes is probably that of the United States Bureau of Labor Statistics covering a continuous series of figures since 1890, embracing at the present time more than four hundred commodities, the prices of which are weighted in proportion to their quantity production. The series from 1913 to date was revised in 1922; the basis of weighting used was the production data contained in the 1919 Census of Manufactures in place of 1909 data previously used. More recently the bureau has revised the balance of the series back to 1890, using 1919 weighting data. The changes from earlier index numbers are quite small prior to 1916, and so the full revised series has been used in the following discussion.

For a fifty-year period prior to this series similar but less extensive and probably less accurate figures were compiled by a congressional committee and embodied in Senate Document No. 1394, commonly known as the "Aldrich Report." Similar indexes have been systematically compiled in other countries for a somewhat longer period, going back in England to about 1800. Special studies of prices in England have also been carried back for over five centuries prior to regular price compilations. Viewed in perspective these early data are of little value in connection with the present inquiry. They show, as is to be expected, an upward tendency throughout the centuries, the causes of which are too remote for helpful present analysis.

Wholesale prices in the United States

for the entire period of their compilation, excluding the World War and previous war peaks, have shown no marked upward tendency. Prices in England, with similar exclusions, have been closely consistent with those in the United States. It is only during the last thirty years that an extended, definite upward trend has prevailed. During the preceding fifteen years an equally pronounced downward trend occurred. The extent to which such trends are now significant depends upon their fundamental causes. The downward movement ending in 1896 was in part the result of an unprecedented expansion of industry, the introduction of labor-saving machinery and a wide extension of agricultural activity, with correspondingly increased transportation facilities. This period also saw the origin and development of electric public utility service, including electric light and power, electric railways and telephones. The twenty years ending with the outbreak of the World War lacked such pioneer development and expansion but, instead witnessed a marked development of labor organization, attended by curtailment of working hours and restriction of production which to a large extent offset the growth in per capita production normally resulting from increasing labor-saving appliances and contributed to an increase in price levels. If, as it appears, industrial conditions which prevailed during the past thirty years, and which will probably continue in the future to a considerable extent, are substantially different from those previously existing, the usefulness of extending price trend studies beyond this period into the past is doubtful.

BUREAU OF LABOR INDEX CHOSEN

After a study of the various price indexes available for this period, the committee has selected, for the purpose of illustrating trends, the all-commodity wholesale data of the Bureau of Labor Statistics as most representative of general price conditions. An index of the Harvard Economic Service covering a much more restricted but more sensitive group of basic materials shows wider fluctuations but almost exactly the same trend. The Dun and Bradstreet indexes show slightly greater and less upward trends, respectively, as should be expected from the different commodities and methods of computation employed.

The committee presents herewith a chart reproducing the all-commodity index of the Bureau of Labor Statistics from 1890 to 1922, inclusive, plotted on semi-logarithmic paper so that on any part of the price curve a certain vertical distance or slope of line represents a uniform percentage or rate of increase. The year 1913, which has been the conventional base of 100 for such curves, is assumed to be the logical point through which a projected trend line should pass. As shown on the accompanying chart, the committee has drawn a trend line following closely the price curve from 1890 to 1913. The

line has not been extended through earlier years because of the disturbing effect of business depression and other factors in the preceding years. The projection of this trend line to 1923 gives an index of about 120. An index of 125 is shown in 1926 and of 150 in 1936. The actual wholesale price level is now substantially above this latter point, with an upward tendency, and so, in the absence of recessions in the meantime, the trend index would not equal the actual index until at least fifteen years hence.

In the long run it is to be expected that commodities of various kinds will have prices bearing a reasonably constant relation to each other. This is necessarily the case because otherwise the producers of commodities commanding only a comparatively low price would in time transfer their activities to other more profitable fields. The commodities which are used by the

of electric railway materials for a considerable number of years. For this index he has used fuel, lumber and metals, using the Bureau of Labor Statistics' figures for his combination. A comparison of Mr. Richey's curve from 1914 to date with the Bureau of Labor Statistics' all-commodity curve shows close agreement during the first four years, but materially lower prices for the following two and one-half years, and correspondingly higher levels thereafter. Mr. Richey's curve was not intended as an index to construction cost, having a more direct bearing upon operation and maintenance.

In 1922 Robert M. Feustel, a former member of this committee, completed an exhaustive study of price movements in connection with a valuation of a large railway system. This study included the computation of a series of valuation index numbers for the years from 1892 to 1921, inclusive,

Chart Showing Relation of "All Commodity Index" and "Electric Railway Construction Index" as Compiled by Albert S. Richey

Bureau of Labor Statistics in its index computations are divided into nine general classes. A study of these different class indexes during the period under review shows material departures from the all-commodity average particularly during the war period.

ELECTRIC RAILWAY MATERIAL COSTS

Having in mind that we are concerned primarily with the materials entering into electric railway construction, it is of interest to determine how closely the all-commodity index compares with the two classes of materials included in the Bureau of Labor Statistics series which are most closely associated with electric railway construction requirements. These two classes, building materials and metals and metal products, include about 13 per cent in value of all commodities produced in the United States. A study of the index data shows that during the past thirty years building material prices have followed very closely the all-commodity prices. Metals and metal products, the only other group extensively involved in electric railway construction, show less consistent movements, with an upward but irregular trend.

It is of interest to see how closely more specific indexes of electric railway material correspond with the price curve and trend line accompanying this report. Albert S. Richey, a member of this committee, has compiled an index

weighted in accordance with a recent inventory of the property. The trend of these index numbers shows a reasonable consistency with the all-commodity trend, being slightly less upward and reaching the 150 level at a later date. This particular trend study applies only to one large property, which in certain important respects differs from typical electric railway properties.

The committee has had opportunity to study price data compiled from extensive collections of appraisal and construction cost data made by organizations now represented on the committee, covering a very large proportion of the period under consideration. An analysis has been made of these data and the relation of prices prevailing in the different years determined through a careful weighting of all the various elements entering into public utility construction. In making these appraisals transient fluctuations in prices were commonly ignored, resulting in a curve of prices without the fluctuations shown in the all-commodity index. During the earlier part of the period studied electric railway materials or the labor employed in their assembly in railway properties were somewhat lower than the all-commodity average and a trend line constructed from the weighted indexes of such construction shows a sharper upward tendency than the all-commodity trend; in fact, it reaches 150 level several years earlier,

as is shown by a broken line on the accompanying chart.

It should be pointed out that construction work such as buildings and other parts of electric railway properties requires labor of a different character from that employed in commodity fabrication, and subject to different wage movements. The wages of construction employees have increased more rapidly than those of factory workers and have recently continued at relatively higher levels. For this reason, the application of commodity indexes to construction work involving not only commodities but special labor may not yield reliable results, except after a considerable period of industrial stability.

It is obvious that if trend prices, based upon such different indexes as are herein considered, yield widely variable results when projected into the future, they cannot be used as the basis of accurate computations of property value. When it is further considered that objections may be raised to the limiting of trend studies to the specific period selected herein when the upward tendency has been unusually great, the limitations surrounding the usefulness of trend prices become apparent.

In determinations of property value in which neither historical prices nor those prevailing at the time of the inquiry are acceptable to the parties concerned, trend prices are sometimes used as the basis of a compromise. In cases where the expense of new appraisals is undesirable and appraisals of pre-war property at pre-war prices are available, this property might be valued at trend prices (about 25 per cent higher than pre-war prices), adding to such value the actual cost of subsequently acquired property, the total value thus obtained being somewhat below present cost of reproduction. The committee is of the opinion that such compromises have little scientific or economic justification, and it does not recommend any general use of such methods. The determination of fair value being a matter of sound judgment, the injection of evidence of value based upon complicated and uncertain factors is more apt to hinder than to aid the exercise of such judgment.

WAR PERIOD PRICES

While the violent fluctuations in prices since the beginning of the European war have no bearing upon the trend prices so far discussed, the movements in wholesale prices during the last two years are of interest in their bearing upon prices which may prevail in the future. It was more than a year after the beginning of the war when prices in the United States began to rise. There was a fairly steady increase up to the time the United States entered the war, then a slight recession incident to governmental price fixing, followed by another less uniform increase, continuing until May, 1920, when the maximum monthly level of 247 (Bureau of Labor Statistics, revised, 1913 = 100) was reached. From

this peak a precipitate decline continued for one year. Since the middle of 1921 the marked downward movement has ceased, and for more than twelve months the tendency has again been definitely upward. The increase during 1922 was about 12 per cent.

The average of all wholesale prices now corresponds quite closely to the cost of living indexes compiled by the National Industrial Conference Board and others. Inconsistencies still exist between different classes of commodities, but, on the whole, the tendencies of the various groups and of single commodities have been toward the general average. This is particularly true of copper, so important in electrical industries, which, until a few months ago, was radically out of line with other public utility material, but has since moved toward consistency. On the other hand, other metals and building materials, already above the average, are moving further upward under the stimulus of construction activities. Such exceptions to the general trend will continue until demands originating from war-time restrictions are more fully satisfied than has so far been possible.

Electric railway construction costs followed the upward movement of all-commodity prices quite closely during the early part of the war period, but subsequent to the peak have not shown as great a decline, due to the continued high cost of construction materials and labor. A curve showing mid-year cost indexes is given on the chart already referred to.

Until the latter part of 1921 there was justification for designating the prices prevailing during the preceding five years as abnormal. Many people still believed that prices would go back to the pre-war so-called "normal" level, in spite of the active resistance of labor to wage reductions. The committee is not convinced that prices prevailing during and for some years prior to 1913 should now be considered normal any more than equally stable prices at quite different levels at other periods in our history, one of which we may now have entered.

FUTURE PRICES

The question as to whether or not future prices will continue on a level comparable with that prevailing during the past two years, or will gradually or abruptly fall toward the pre-war level, is one of great importance to public utilities, in their operating and construction programs and in rate proceedings. Valuations and rates are fixed by regulatory bodies for application to future periods of considerable length. If during such periods declines in operating and construction costs are to be expected, the regulatory commissions will probably take cognizance of such expectations in their decisions. If, on the other hand, prices for a considerable term of years are to remain at present or higher levels, more weight should be given to prevailing prices in valuation and rate determinations.

In spite of the vast amount of study

which has been given to the causes of price movements, there is as yet no complete agreement as to what the fundamental causes are. The committee, within the limitations of this report, cannot enter into an extended consideration of this subject, but it appears desirable to discuss certain factors which are clearly pertinent and through which some approximate conclusions may be reached regarding future price movements.

The normal basis of money, in which prices are expressed, is gold. The gold standard has prevailed in the United States except for limited periods during and following the War of 1812 and the Civil War. It was also in effect in most other important nations prior to the World War, but has since been generally abandoned by the European participants in that war. It is commonly recognized that prices move up and down with the existing stock of monetary gold. Increases in prices have followed all such important discoveries of gold as the California, Klondike and Transvaal fields.

Money itself, however, plays only a minor part in commercial transactions. The bulk of our business is carried on through bank credits which do not necessarily bear a direct ratio to the money in circulation although based upon it. A large part of our monetary gold is not in actual circulation but is held in reserve to support issues of federal reserve notes, which, although limited by the reserve, are not otherwise directly related to it. Nearly one-half of our money now in circulation consists of these notes, and their amount is subject to wide variations at the discretion of the Federal Reserve authorities.

Prices are also affected by the speed with which operations involving the use of money or credit are carried on and by the efficiency with which commodities are produced and marketed. An increase in money turn-over has the same tendency to increase prices as an increase in quantity of money; on the other hand, an increase in efficiency of production tends to reduce prices. There are other factors, involved to some extent in those already stated, which will have at least temporary effects upon price levels in this country. They include our restrictive immigration policy, artificial wage levels maintained through labor organizations, foreign trade balances, high taxes and dwindling natural resources.

All these factors and others of less significance are constantly working to influence price levels. With respect to those tending to maintain high prices, it should be noted that our present stock of monetary gold is nearly double the 1913 amount and is still increasing, although at a steadily diminishing rate. Our European war allies owe us in gold more than the entire monetary supply of the world. In the absence of wholesale inter-allied debt cancellation and the development of unprecedented European trade balances, it is difficult to see how the United States can dispose of any large part of its

gold. Bank credits may be expected to expand with steadily improving bank facilities, the turn-over of money may also increase and the issue of Federal Reserve notes may be enlarged—all to the extent that existing industrial activity may at any time require. The present insistent demands for higher wages, from existing levels well in excess of living cost indexes; renewed agitation for shorter hours and improved working conditions, and shortages of farm and industrial labor, with little relief in prospect through immigration, all work strongly against price recessions.

The possibilities of price reductions lie primarily in an increase in productivity through labor-saving machinery, more efficient and willing labor, more working hours and immigration. Wage reductions, desirable within certain limits in the interests of both workers and consumers, are not to be expected on any large scale. More extensive and efficient use of natural resources, such as water powers, is still possible and probable to a helpful extent. It may be possible to reduce our stock of gold or its effects through debt cancellation, increased imports, or by withholding note circulation based upon superfluous stock. The effect of these various factors tending to reduce prices, even in favorable combination, can hardly be expected for the present or in the near future to outweigh the opposing factors, particularly in the construction field where skilled labor is essential.

PRESENT PRICES WILL CONTINUE

It is, therefore, the opinion of the committee that price levels applicable to electric railway properties as a whole at least equal to those now prevailing will continue for a considerable number of years, after which some recessions may be expected, but not to pre-war levels or any close approach thereto.

It would not be unreasonable to expect that within ten or fifteen years the electric railway price level will approach the projected trend price as shown on the accompanying chart. The committee is of the opinion that more definite predictions are not warranted from the available data.

The committee is not unmindful of the price recessions which have occurred after the close of previous wars in this and other countries. Our Civil War is frequently cited to substantiate a claim that prices will gradually return to pre-war levels. A study of financial history shows that the Civil War price increases were largely due to the issue of greenbacks which were not redeemable in gold until 1879 (fourteen years after the close of the war), at which time prices returned to about the 1860 level. Prices based on gold showed comparatively little fluctuation during the Civil War. Similar reasons, or others showing no greater bearing of past war prices upon the present situation, could be given if further substantiation of present predictions were necessary.

The views with respect to future prices stated herein are shared by all qualified authorities known to the committee, at least to the extent of holding that substantial price recessions are not to be expected before 1930, and that pre-war prices are a closed book.

With the passing of years a steadily increasing proportion of the investment in electric railway property and renewals thereof will have been made on the present plateau of prices, and actual investment will approach more and more nearly the value found through appraisals based on the cost of reproduction at existing prices. The expectation of this future restoration of the consistency between investment and cost of reproduction which existed dur-

ing the pre-war period of regulation, when the latter basis of value gave results which were generally acceptable, is a further justification for the conclusion stated elsewhere in this report that cost of reproduction based upon stabilized present prices is the most important basis of fair value which courts and commissions alike can use consistently and with justice to all interested parties.

The report was signed by E. G. Bechtel, H. A. Clarke, W. Findlay Downs, J. A. Emery, C. W. Gillespie, F. C. Hamilton, J. B. Klumpp, W. H. Maltbie, L. R. Nash, A. T. Perkins, A. S. Richey, W. H. Sawyer, Frank Silliman, W. B. Tuttle, E. D. Uhlen-dorf and James P. Barnes, chairman.

New England Club Opens Season with Worth-While Program

Some New Thoughts Brought Out on Light-Weight Cars, Standardization of Air-Brake Equipment, Automatic Substations, Track Construction, and Public Relations—Two Hundred Attend Evening Dinner at Boston

SOME very worth-while talks on practical subjects and an enthusiastic gathering marked the first of the season's meetings for the New England Street Railway Club at Boston on Oct. 25. It was presided over, both afternoon and evening, by the president, Ralph Hood, and there were about 200 present at the evening dinner.

J. C. Thirlwall, General Electric Company, discussed lightweight city and interurban cars and the results obtained. He recalled how some engineers had thought the original safety cars were too light, but he said actual experience has not borne out this fear. The present maintenance cost on the Birney safety cars installed five years ago in Fort Worth, Tex., the original installation, is less than 2 cents per car-mile. The average for all safety cars used in Texas is running about 1.75 cents per car-mile, as against 3.5 cents per car-mile for the older and heavier type cars on the same properties.

Speaking of the installation of light-weight one-man cars in interurban service in the Middle West, Mr. Thirlwall said that for the cars of the Cincinnati, Lawrenceburg & Aurora Railway, which have now been in operation five years and are operating 96,000 miles a year, the maintenance cost for the first six months of 1923 was 1.46 cents per car-mile, and that it has averaged 1.48 cents per car-mile for the five-year period. These cars have netted a total saving of \$220,000 in five and a half years on an investment of \$100,000, of which \$60,000 was almost immediately returned through sale of the old cars and taking down of copper.

The first year of operation of the light-weight one-man cars of the Kentucky Traction & Terminal Company, Lexington, Ky., showed 38 per cent

increase in car mileage, 30.5 per cent increase in passengers, 12.7 per cent increase in passenger revenue, a reduction of 37 per cent in expenses, a reduction in the power demand of 350 kw., and an increase in net income of 102 per cent.

The 32,000-lb. cars of the Western Ohio Railway, equipped with 35-hp. motors to maintain the same schedule speed as the heavier cars which they replaced, showed a maintenance cost for the first five months of 1923 of \$2,893, compared with a maintenance cost for the old equipment of \$5,070 for the first five months of 1922, and a corresponding reduction in power cost from \$24,261 for the first five months of 1922, to \$15,765 in 1923. These two items alone indicate a saving of more than \$10,500 in five months.

He mentioned the cars soon to be delivered to the Indiana, Columbus & Eastern Traction Company, which represent a further development of the light-weight car idea. They will weigh 50,800 lb., seat fifty-six, and are equipped with four 60-hp. tap field motors geared for 55 m.p.h., which they will actually make. The cars which they displace weigh 86,000 lb. and while geared for 60 m.p.h., actually make only 54 m.p.h. on account of the voltage drop which will not prevail with the new cars because of their smaller energy consumption.

From these examples, Mr. Thirlwall commented that it is evident that very material weight reduction can be accomplished in practically all types of cars.

STANDARDIZATION OF AIR BRAKES FOR LIGHT CARS URGED

E. W. Davis, Westinghouse Traction Brake Company, talked on the subject of brakes and safety devices as applied to light-weight cars. He spoke

of the advantages which had accrued from the approach to standardization with the Birney safety cars, which enabled the air-brake manufacturers to furnish equipment from stock—a thing which has never been possible with any other electric cars. He said that the standardization of brake equipment had gone very much farther in the steam railroad field than in the electric. For example, one type of triple valve for passenger cars, another type for freight cars, and a third type for locomotives, have almost universal use. By contrast, a great number of different types are required for the electric railway field.

Mr. Davis then discussed briefly the variable load brake which has been found desirable for the light-weight cars where the live load may be a considerable per cent of the total load. The first application of these brakes has been made on double-truck cars, but Mr. Davis said that it was his hope that such brakes might soon be available for use on single-truck safety cars. He said this type of brake ought to be installed on all new cars of the lighter type purchased henceforth, and it might even be worth while to consider putting them on some of the older cars now in service.

In discussing the various types of braking and safety equipment, including door control, Mr. Davis pointed out that it is possible to meet practically any condition the railway may set up, but he urged that if the railway wants the best service from all of the manufacturing organizations, it will be more likely to get it by using something that they are making regularly in large quantities.

To give an idea of the lack of uniformity in equipment used in the electric railway field, Mr. Davis said that he had in mind ten or twelve different companies which had bought cars within the last year, all of which might be classed as light-weight double-truck cars largely for one-man operation, and there were no two cases in which the door operation was the same. In two cases the Brake Company even had to build special brake equipment, and in several other cases it built other parts of equipment which will probably have no application on other properties. Nearly all modern manufacture is conducted by large organizations, and while they can provide some flexibility in their operations, so many special developments are bound to be costly to the consumers.

Charles F. Johnson, of the J. G. Brill Company, spoke briefly on the various types of car bodies applied to light-weight cars.

FIELD OF AUTOMATIC SUBSTATION EXPANDING

C. A. Butcher, Westinghouse Electric & Manufacturing Company, discussed the application of automatic substations and said that there are now in operation on or order some 500. He said that the Cleveland Railway is at present contemplating an expansion of its

present automatic substation installation to include ultimately thirty automatic substations. There will be a supervisory control, by which it will be possible to open and close any feeder, start or stop any machine, transfer the load from one high-tension line to another at any station, and obtain a continuous graphic curve of the load at each station—all of which is done by means of a two-wire line to each substation, which can also be used as a telephone line.

In Baltimore, four automatic substations are shortly to be installed. An interesting development here is that not only does the location of substations at the load centers reduce materially the cable losses, but it is possible to regulate so as to provide that voltage which will be most economical for the traffic conditions prevailing in the district. By means of various taps on the transformers, the d.c. voltage may be varied from 500 to 600. It was impossible to calculate what the most economical voltage would be, and therefore various taps were provided and they will be tested out over a period of operation to find the most economical voltage for the particular traffic conditions in each district.

Mr. Butcher said that the advent of supervisory control has greatly expanded the field of automatic substations and automatic control of generating stations. He said it was possible now to picture in the future one man sitting in an office building who would have absolute control over the entire generation and utilization of energy in a community.

Referring to Mr. Butcher's comment on the advantage of being able to locate an automatic substation just where it was needed, J. C. Thirlwall said that this was sometimes very difficult on account of the objections to a substation in residential sections. He told how the Los Angeles Railway had overcome this difficulty and had built three automatic substations in high class residential districts and had succeeded in making them absolutely noiseless. He said you could put your ear against the door and could not tell whether the machine was running or not. It cost about \$10,000 extra to accomplish this noiseless feature and to give the station a decorative appearance, but the interest on this added investment is earned in the first two months of each year as a result of savings from having the station where it is actually needed.

R. B. Fehr, Rail Welding & Bonding Company, Cleveland, gave a very interesting blackboard discussion of the technique of seam welding of rail joints. The possibilities for making these joints more efficient were outlined as: (1) Careful preparation of the joint at the rail ends and tight bolting to secure good alignment and some initial compression; (2) improved method of welding, including the hand feed method of applying the metal; (3) increasing the section modulus of the joint; (4) applying a thick seam;

(5) interrupting the base seam for a distance of 6 in. at the center.

RAILWAY MEN TALK OPERATING MATTERS AT DINNER

While all of the talks at the afternoon meeting were supplied by manufacturers' engineers, railway men occupied the platform entirely after dinner. Edward Dana, general manager Boston Elevated Railway, reported briefly on some aspects of the Atlantic City convention. He paid a tribute to former president C. D. Emmons, saying that a large measure of the success of the convention was attributable to his leadership. He thought it was a healthy sign, not a bad one, that the bus occupied 24 per cent of the exhibit space at the railway convention. He thought the convention marked the full realization that bus and street car will go together in future transportation. He proposed, and the convention voted, a resolution congratulating Britton I. Budd on the success of the Chicago, North Shore & Milwaukee Railroad in being awarded the Charles A. Coffin prize for 1923.

H. M. Steward, superintendent of maintenance Boston Elevated Railway, addressed the meeting on the subject of new track appliances and practice. He spoke of the new tie exhibited at the convention by the International Steel Tie Company, especially adapted for rebuilding concrete track, the tie being so shallow as to permit leaving in the old construction. He also spoke of the Sandsberg sorbitic process of treating rail, which it is claimed will make the rail last from four to six times as long as untreated rail. The Boston Elevated Railway is trying out some of this. He also spoke of the Barley frictionless rail, consisting of a narrow head rail for use on the inside of curves. Some of this is being used on the Boston Elevated, and it appears to reduce noise and corrugation and give longer life.

Mr. Steward emphasized the great importance of using machines in track construction work to eliminate hand labor as far as possible. He said that this practice had made it possible to build track now at practically no greater cost per mile than twenty years ago. He outlined the practice of the Boston Elevated as follows:

Track construction is done with gangs of not over fifty men. A portable track is put in where possible, so that one track can be completely tied up. If it is necessary to use cross-overs, however, signals are installed to keep delays to traffic to a minimum.

A pavement plow is used to tear up the old pavement, but the blocks are still picked up by hand. The rails are cut up into convenient lengths by means of an acetylene torch. A crane car tears up the track bodily and lays it out to one side. Electric shovels do the excavating, and the newer ones, equipped with caterpillar tractors, are particularly effective. They excavate the material and dump it directly into motor trucks. A steam roller is used

to roll the trench. The new track is assembled in the trench, the ballast distributed, the track aligned and then tamped with pneumatic tampers. Concrete mixers running on the rails are used, and each is accompanied by a loader. The use of loaders cuts the crew down to a minimum, and the scheme followed is to have one batch in the hopper, one in the mixer, and one in the loader simultaneously. The paving is then applied. Of course, welding machines, grinders and miscellaneous tools are used at the proper points in the course of construction.

Mr. Steward said it was only possible to do twelve to fifteen construction jobs in a season, and even this necessitated very quick movement of equipment from one job to another.

Each day the construction foreman on a job orders by 4 o'clock the material and machinery he will need the next day. One man is in the office and does nothing but see to it that his needs are supplied, when needed.

Speaking of rail joints, Mr. Steward mentioned the work of the committee on welded rail joints and said that he was convinced in his own mind that the seam-welded joints will be one of two types used on any property. The seam weld will be used very generally, but one of the other types will be used for special locations.

A FEW REMARKS ON SAFETY

Fred A. Cummings, Eastern Massachusetts Street Railway, gave a very lively talk on safety and public relations, saying that he was going to talk from the point of view of "the man who is too poor to own an automobile and is obliged to ride on the street car." He said that the best way for a company to pursue the work of safety is to keep everlastingly at the small details of maintaining the cars and plant in perfect condition, and then bring it right home to the men just what it costs for accidents.

Mr. Cummings stated that nearly every railway assumes a niggardly attitude toward the claims department, but that there is no department which needs the inspiration and deserves the attention of the general manager so much. There is too much of the attitude of wanting to settle every claim, regardless of its merit, and not enough of fighting claims out in court, Mr. Cummings contended.

Referring to the proposed bill to come before the Massachusetts Legislature abolishing one-man operation of cars, he said that the various Massachusetts street railways have operated 55,845,819 miles of one-man operation, and that the accident record has been considerably improved, as compared with two-man operation. He said that this was largely due to the greater responsibility felt and discharged by the individual operator. This was attested by the argument he heard an operator make at a car barn. The operator said, "This chariot is mine. Nobody gets on or off unless I know it. I'm the guy."

The Electric Railways Have Come Back*

Operating Revenue Greater than Five Years Ago—Net Income Two and a Half Times as Great—Buses Have Failed When Required to Give All Local Transportation

BY JAMES W. WELSH

Secretary American Electric Railway Association

IT IS a most encouraging sign that an invitation from the Investment Bankers' Association is extended to a representative of the electric railway industry to present a brief review of its status. It has not been long since the mere mention of electric railways in the presence of a banker produced a decided chill in the atmosphere. This disposition probably still exists to some extent, but there also seems to have come a feeling of curiosity as to just what is coming next. Apparently everything that could happen to dampen the enthusiasm of the investor in electric railways has already happened, but the cars still keep running.

They are running in New Jersey after an interruption of 50 days, although for a while the issue looked doubtful, but the damage to business and the inconvenience suffered by the public as a result of the stopping of service proved beyond all doubt the essentiality of street railway service. The authorities insisted upon their return, and the people were glad to get them back. They have been voted back overwhelmingly by three to one in Saginaw, Michigan, where service was suspended for two years while the people were misled with make-shift buses and would-be financial plans all of which failed dismally; they are running in Bridgeport, Conn., where service was suspended for 56 days in 1920; and in Toledo, Ohio, where an interruption of 27 days occurred in 1919, while an effort was made to dispense with their service. They are even running in New York City, where hopes of some have been high that, here, of all places, the great bus adventure might be tried.

From all this the conviction is growing that after all the electric railways are essential in providing transportation service. Everyone likes to have an advance tip, and it is rumored that investment bankers are not above this excusable trait of human nature—The tip is this: *The electric railways have come back!*

As you may be "from Missouri," I will ask you to bear with me through some statistics.

CENSUS FIGURES SHOW GROWTH OF 2.5 PER CENT A YEAR

The U. S. Bureau of the Census is just completing its regular five-year census of the electric railway industry. So far the complete financial figures for the country are not available but the traffic figures are: In 1922 out of more than 15 billion passengers including transfers over 12½ billion pay passen-

gers were carried by the electric railway companies in the United States, an increase of one and a quarter billion, or 12 per cent over the previous census of 1917. This is an increase of approximately 2.5 per cent per year while population has increased less than one per cent. Putting this on a unit basis to get the "riding habit," we find there were 117 revenue passengers carried per inhabitant the country over in 1922 as compared with 109 in 1917 and 100 in 1912. These figures definitely put aside the fear that taking the country as a whole, competition from the motor vehicle, either in the form of the common carrier bus and jitney, or the private automobile, is at the expense of the electric railways.

So much for the question of traffic. Now let us consider the matter of fares, for upon these two factors, fares and traffic, hang the revenues of the electric railway. In 1917 the average fare per passenger was 5.1 cents, today it is 7.3 cents and in 1921 it reached 7.5 cents. A trolley ride and a fixed fare no longer are synonymous and the public has come to realize that fares vary in accordance with the cost of service in different cities throughout the country.

Operating revenues of electric railway companies according to Association estimates have increased 47 per cent over 1917 and now are close to a billion dollars annually. The operating ratio which rose from 65 per cent in 1917 to 80 per cent in 1920 for a group of 225 companies fell to 73 per cent in 1922. The net income is approximately 2.5 times the 1917 figures.

The abandonment of electric railway trackage in certain parts of the country has been cited as evidence of the decadence of this mode of transportation and its replacement by another. The government census figures show a track mileage of 43,934 in 1922 as against 44,808 in 1917 or a net loss of 874 amounting to 2 per cent. It is not to be understood, however, that no new extensions have been made. Detail figures on file with our association show that new track developments to the amount of 1,450 miles have been made during the five years while abandonments aggregating 3,320 miles have occurred, the net loss being as above.

One reason for this was that the country was approaching the "saturation point" with respect to electric railways. Practically every community that offered the slightest possibility of successful operation had an electric railway system. And many that did not offer any possibility nevertheless had them anyway, financed usually by real estate speculators who expected to get their money back through increased

*Abstract of address at annual convention of Investment Bankers' Association of America, Washington, D. C., Oct. 29-31, 1923.

land values rather than from the successful operation of the railway, though as to this they were not without hope. Another reason for the decline in construction was the rise in prices of all materials with the opening of the world war. This abandoned trackage represents construction in unprofitable districts where the traffic could not bear the cost of service. Every industry constantly experiences such changes and the sooner it recognizes it, the healthier it is for it.

In many of these places electric railways have installed a bus service rather than have the district without transportation service. A total of about 2,000 miles of bus route is now being operated by railway companies.

Coming to the question of car equipment, our records show that a total of over 13,000 new street cars have been purchased and put in service during this period out of 80,000 in regular operation. These include both replacements and additions to service but they always make friends for the railway. In 1921 there was expended \$150,000,000 for improvements and betterments and for the current year it is estimated \$250,000,000 in new capital is needed. All of the above facts establish the electric railway as a necessary business with increasing traffic, increasing revenues and increasing facilities.

NOTHING TO FEAR FROM BUS

Those who fear that the motor bus will replace the electric railway might do well to consider the economic and legal principles involved. It has been definitely proved wherever a complete transportation system serving a whole community has been tried by motor bus that the cost is greater than by electric railway, except in instances where the service is infrequent and the density of traffic light.

Examples of profitable operation of the bus at lower fares are frequently quoted as evidences of its ability to undersell the trolley. The fallacy of this contention lies in comparing a rate of fare on one bus route or a group of favorable routes with that of a whole trolley system serving all parts of the community. It may not be generally understood that the earning capacity of various routes in a community vary through the widest possible range and that where a transportation company provides a universal service many long-haul and poorly patronized routes are carried at the expense of the short riders in the densely populated districts all for the great good of the greatest number.

The principle of co-ordinating all agencies of transportation serving the needs of each community rather than to permit a ruinous and destructive competition to develop has been promulgated by the American Electric Railway Association and is generally recognized as sound economic doctrine and in accordance with the principles of public utility regulation and control.

There is, however, one thing to which I wish to direct your attention as in-

vestment bankers. This is the type of prospectus frequently circulated for the purpose of attracting investors to this field. I might cite the results of a careful analysis I recently had made of one of these prospectuses. The figures showed that with a small payment down a bus could be paid for out of earnings in 18 months. The life of a bus was estimated at four years and, during the last two and one-half years, a reserve was set up to replace the vehicle. The plan was cleverly conceived and is exceptionally plausible, except that the earnings of the bus are tremendously exaggerated.

This prospectus states that the average daily earning power of a 26-passenger bus is conservatively estimated at \$75. I have good reasons to doubt this. Figures compiled by us, from the operating records of 12 electric railways using buses as adjuncts to their rail cars, show that the average daily gross earnings are approximately \$29. It may be said, and with some reasonableness, that these operations do not truly reflect the true earning capacity of a bus, as these buses are used in some cases in the less remunerative territories. However, an investigation of the earnings per bus of some of the most successful independent bus companies in the country, confirms our beliefs that the earnings given in the prospectus are entirely misleading.

For example, the average daily earnings per bus on the Fifth Avenue Coach Company's lines in 1922 were approximately \$52. It should be noted that these vehicles are of the double-deck type having almost twice the capacity of those referred to in the prospectus and furthermore a 10-cent fare is charged. Also, the traffic density and other operating features combine to assure to the Fifth Avenue Coach Company a maximum earning power for its buses.

In this connection, it might be pointed out that the operating statement of the Fifth Avenue Coach Company indicated that it would be impossible for it to operate on a 5-cent fare, as the operating cost per passenger exclusive of investment charges and taxes for the year ending June 30, 1922 was approximately 7 cents.

Obviously, the whole argument set up in the prospectus referred to, falls like a house of cards when proper figures are substituted in the operating statement presented.

BUSES REGULATED IN MOST STATES

Let us next consider the attitude of the regulating commissions with respect to responsibility for furnishing transportation services.

Twenty-five states and the District of Columbia have enacted legislation requiring motor vehicle common carriers to obtain a certificate of public convenience and necessity from the state commission as a prerequisite to the establishment of any kind of service.

A distinct trend from a policy of encouraging motor bus lines wherever

possible to one of affording adequate protection to existing carriers can be traced in the decisions of eleven commissions on petitions for certificates.

In only two states, Illinois and Nebraska, where the commission has authority to grant certificates of public convenience and necessity, have they shown a tendency to encourage development of bus lines at the expense of the railways, and in the state of Illinois at least the courts have stepped in and reversed the decision of the commission.

In many states the commissions have as complete jurisdiction over bus operations as they have over other public utilities, including electric railways. For instance in nineteen states the commission has authority to investigate and fix the rates of fare charged by bus lines; in fourteen states it prescribes routes and in sixteen states it prescribes schedules for bus lines. Seventeen of the state commissions have issued general orders promulgating rules and regulations for the operation of buses. Thirty-six states have imposed a gasoline tax. There are, in fact, only six states in the union which have taken no official action whatever with regard to the buses.

OTHER FAVORABLE CONDITIONS

Another fear that at times impairs the credit of the industry is the threat of political oppression. Probably the most effective weapon against the antagonist is the building up of good public relations. Telling the industry's story to the public, however, has become a national watch-word. This is not a spasmodic campaign but is a continuing activity in keeping the public advised of its responsibility in maintaining its transportation service. Coupled with this has been the introduction of all known means of economical operation. This included one-man cars and for the industry there are now 10,000 in operation as compared with less than 1,000 in 1917. Organized safety methods are resulting in a material reduction in the cost of accidents, which for the industry have fallen from 3.24 per cent of gross receipts in 1917 to 2.68 per cent in 1922.

The use of automatic and remotely controlled sub-station equipment as a factor in reducing power costs has received wide application. This together with the use of power saving devices and a more intelligent use of electricity are resulting in material reduction in the total cost of power. The use of electric and metal composition welding processes has effected material savings in the maintenance and repair departments.

Improved relations with labor have been effected in many places with a corresponding increase in efficiency and elimination of loss through strikes. These are but a few of the economies typical of what wide-awake and progressive companies are doing and which are winning for them success beyond their fondest hopes.

Maintenance of Equipment

Old Trolley Poles for Yard Lighting

THE accompanying illustration shows a trolley pole used to support lights in one of the yards of the New York Rapid Transit Corporation. A few years ago, when building its new subway and

By Adding Steps and Bracket, Old Steel Pole Is Utilized for Supporting Lights

elevated lines in Brooklyn, this company constructed elevated structures on several streets which had previously been occupied by surface lines. As the trolley poles of the surface companies could not be used to support the overhead work after the elevated structures had been built, they were taken down and were given to the Rapid Transit Corporation in return for the right to attach the wires of the surface lines to the new elevated structures.

This arrangement gave the Rapid Transit Corporation several hundred trolley poles for which it had no use. While some of these poles could be sold, there were still many left on the hands of the new company and the price received for them was not great. Therefore, when it was desired to light the yards where the subway and elevated cars are stored, a number of these poles were set to support the lighting fixtures and

were provided with steps for the cleaning and renewal of the incandescent lamps which were installed, under suitable reflectors, on them. A casting was fitted to the top of the pole to act as a bracket and the whole made a very neat and strong layout at a cost that would not equal that of new pipe of much smaller section if it had had to be purchased especially for this purpose.

Cleaning Motor Parts with an Alkali Bath

By O. A. NORENE

Assistant Master Mechanic Omaha & Council Bluffs Street Railway

AN INEXPENSIVE way of thoroughly cleaning armature housings, armature and axle boxings, field coil flanges, spring pads, etc., is to immerse them in a solution of steam-heated industrial alkali cleaner. After remaining in this solution for from one and one-half to two hours the parts are removed and washed with a hose. Field flanges and spring pads, after being passed through the alkali bath, are dipped in insulating varnish and baked.

As we are not at the present time equipped in Omaha with large tanks and equipment for handling the heavier parts of motor frames, they are cleaned by compressed air, which

removes the loose particles, and the balance is removed with a revolving steel brush operated by the use of a small air grinder motor. This does a much better and cleaner job than the use of gasoline and brush.

Lathe Bed Lengthened on Concrete Support

REQUIRING a few feet extra of bed length on a 36-in. lathe in the machine shop section of the Norfolk & Western repair shops at Blue-stone Junction, W. Va., the foreman in charge adopted the unusual expedient shown in the accompanying illustration. Two steel plates, 1½ in. thick, of the desired length, and of a width corresponding to that of the rails of the lathe bed, were bolted to substantial brackets mounted on the end of the lathe bed. A concrete block was then cast under the extension of the lathe bed, holding the rails firmly in place by means of countersunk anchor bolts in the concrete.

The motor controller, previously removed from the end of the lathe, was mounted on the outer end of the concrete block, the operating rod connecting it with the lathe carriage being lengthened accordingly.

This construction is called into service only occasionally, but it is substantial and serves its purpose.

The Norfolk & Western Railway Found This an Economical Method for Lengthening a Lathe Bed in the Bluestone Junction Shops

New Equipment Available

Small Size Air Motor Hoist

A NEW air motor hoist of small and compact construction is being marketed by the Ingersoll-Rand Company, New York, N. Y. The outstanding characteristics of the new size A hoist are compactness of design, resulting in low headroom and relatively light weight; an automatic brake, which holds the load under all circumstances, even if the air supply be

Air Motor Hoist

disconnected or fail, and a graduated throttle which permits a very close regulation of both the lifting and the lowering speeds.

A balanced three-cylinder air motor is used which operates in either direction and without vibration at any speed or load within the rated capacity of the machine. The throttle graduation on this new hoist is very fine and insures instant and complete control of the hoist at any speed. A safety stop lever is provided which closes the throttle and stops the motor whenever the load is by chance raised to the top of the hoist lift.

The automatic brake is a new feature as it holds the load at any desired position for any length of time regardless of air pressure. The brake consists of a disk attached to the motor shaft and of a brake plunger with a friction face, which is held in contact with the disk by

springs whenever the hoist is not operating, i.e., whenever the air supply to the motor is cut off either by throttling or otherwise. It is entirely automatic in its action and requires no attention from the operator.

The motor and gears are both inclosed. The motor operates in a bath of oil and the gears turn in a heavy grease. Oil passages lead to all bearings. Ball bearings or bronze bushings are provided at all points where experience has indicated that they will add to the efficiency or life of the hoist. If the hoist be overloaded, it is only necessary to remove the overload, after which the hoist will start up and work again.

A roller bearing monorail trolley can be provided in place of the top hook if desired. The trolley mounting reduces the headroom necessary for installing and because of its rigidity enables an operator to start a loaded hoist along a runway without difficulty.

Development in Hack Saw Blades and Metal Cutting Machines

THREE new improvements in equipment for sawing metal have been placed on the market by Edward G. Herbert, Ltd., Manchester, England. These include a special hacksaw blade, a saw sharpening machine and a metal sawing machine. All are being marketed under the trade name of "Rapidor."

The saw blades are made of high speed steel containing 18 per cent tungsten, and are hardened in a special way to make them tough and durable. A special feature of the blade is a patent set, which extends beyond the root of the tooth. Blades can be sharpened until the original teeth have been entirely ground away and can be sharpened in any suitable grinding machine, but the manufacturers recommend using the new type "Rapidor" machine.

In a test made of this new hacksaw blade a 4-in. diameter mild steel bar was sawed in a machine making 170 strokes per minute. The quickest cut was made in four and three-quarter minutes and the longest cut

Left—Machine for Sharpening Hacksaw Blades. Right—New Type Hacksaw Blade

in ten minutes, the average time being seven minutes per cut. A total of 367 cuts were made, the saw being sharpened nine times during the test.

The Rapidor sharpening machine provides a new method of sharpening hacksaw blades, which consists of grinding them exactly to models having the correct shape of teeth for quick cutting. The grinding wheel is stationary and the blade moves toward the wheel in contact with the model. Teeth are ground on both faces and the machine will sharpen any size or make of hacksaw blade.

The third development is in a new type of sawing machine. These are made in two sizes, one with a capacity of 6-in. rounds or squares and the other having a capacity up to 10 in. rounds and other sections to 12 in. x 18 in. The saw holders have an indicator to show when the blade is strained sufficiently. This prevents breakage of blades through incorrect tension. A dashpot is fitted with a device which enables a start to be made on a sharp corner or square bar without danger of breaking the teeth of the saw.

High Speed Sawing Machine

Safety Nut Lock for Rail Joints

A NEW type of nut lock which has been given the name of "Bull Dog" has been placed on the electric railway market by the Waynesboro Nut Lock Company, Waynesboro, Pa. This nut lock has two projecting lugs on the outside circumference and a dog projection on the inside.

New Type of Nut Lock

As the nut is screwed down on the bolt, a corner of the nut comes between the lugs. Four different angles are provided on the faces of the lugs, and as the nut is screwed into place the washer turns up, so that the lugs do not need to be bent over in order to hold the nut.

The lock operates on the principle of an alligator wrench. The nut can be tightened but not unscrewed as the dog engages the metal and the greater the force applied the deeper will be the grip of the dog. In order to remove the nut, the lugs are knocked off by a cold chisel or screw driver.

Oil Burner for Car Heating

A SELF-GENERATING oil burner for installation in stoves now used for hot air and hot water heating systems in passenger cars is being marketed by the Chausse Oil Burner Company, Detroit, Mich. A number of equipments have already been completed and installed on electric railway cars for a period of testing.

A collar is furnished to go between the door and the firepot of the ordinary stove. This makes the door about $\frac{1}{2}$ in. further away than usual from the firepot and gives room for pipe to be run into the stove. Under the body of the car a 30-gal. high-pressure oil tank is

installed. This size tank is sufficient for about thirty hours continuous service, and from 5 to 20 lb. air pressure is required to force the oil up through the piping to the burner in the car. Air pressure is obtained from the ordinary compressor tank through a reducing valve, but in case of compressor failure enough pressure will remain in the tank to operate the heater for several hours.

The oil is forced up through a series of pipes to the gas-generating burner in the stove. To light the burner it is necessary only to open a valve and throw a piece of burning newspaper into the fire pot. A feature of this system is that the regulating valve is not on the fuel pipe, but on the gas pipe. This makes it possible for the burner to be turned down in mild weather without causing carbonization. Distillate or furnace oil is ordinarily used, but old transformer oil, crankcase and compressor drainings or kerosene may be used.

An important item is the safety valve to extinguish the flame instantly in case of collision, derailment or overturning of the car. It operates also in case the car catches on fire. This valve, however, is not affected by ordinary coupling shock. In case the fire in the burner goes out, a valve automatically shuts off

High-Speed Under-Swing Cut-Off Saw

THE general method of mounting cut-off saws is to suspend them either from the wall or ceiling. A radical departure from this is now being marketed by the Oliver Machinery Company, Grand Rapids, Mich., in its new No. 96 high-speed under-swing cut-off saw. This saw is of the under-slung type and is made for either belt or motor drive. By pressing a foot treadle the saw is brought forward to cut up 2-in. material up to 22 in. wide or 4-in. up to 16 in. wide. The saw returns by releasing the pressure on the treadle. A spring is used in connection with the foot treadle to give a quick return and insure rapid operation.

The saw is guarded by an adjustable guard and has an inclosed saw-dust chute. The main part of the table is cast iron, 22 in. x 36 in. and is 33 in. high. Two auxiliary tables or extensions are furnished, fitted with two rollers each, and the right hand section is fitted with a positive stop gage with three adjustable stops. The forward and back stroke of the saw arbor is adjustable for short or long strokes and the spring mechanism prevents jerking and jarring on both the forward and return adjustment of the saw.

Under-Slung Cut-Off Saw with Self-Contained Motor Drive

the flow of oil, which will not commence again until the burner is lighted.

In one recent test the burner is said to have raised the temperature of a cold car to 76 deg. F. in twenty-one minutes. The complete outfit, without fuel, weighs 70 lb., of which 45 lb. is in the tank and 25 lb. in the burner and safety devices.

For belt drive a countershaft is furnished and for motor drive an extended sole plate in place of the countershaft. The saw arbor itself can be locked in a stationary position, so that it can be used as a rip saw, and by using the miter gage it can be made to serve like the ordinary stationary arbor cut-off saw for cross-cutting work.

The News of the Industry

One-Man Operation Attacked

City of Oakland Repudiates Previous
Action and Seeks to Coërcé
Local Railway

The city of Oakland, Cal., through its elected officials, is up in arms against the San Francisco-Oakland Terminal Railways. There is no doubt that most of the moves made against the railway are political in character, but they have nevertheless had the effect of embarrassing the company. The railway has been made the butt in disputes over service, fares and one-man cars. As a matter of fact, however, the one-man car has been singled out by the city as most vulnerable for attack. Accordingly the one-man cars have been banned, as was indicated in the *ELECTRIC RAILWAY JOURNAL* for Oct. 20, page 722, the city would do.

On its part, the railway has refused to comply with the order and continues to operate this type of equipment. In fact, the company has challenged the city with respect to its authority in this matter, jurisdiction over the operation of the railway having been transferred to the State Railroad Commission in 1914.

It had been anticipated that perhaps the city would seek to use its police power to enforce its one-man car order, but instead it retaliated by literally declaring war on the railway. The city started at once to negotiate with the Peerless Stage Company for a franchised bus service, indicated that it would revoke the jitney prohibitory ordinance and then purchased and put into operation a twenty-nine-passenger Fageol safety coach on Telegraph Avenue. Two more buses have been ordered for early delivery, and the Council has declared that as soon as funds can be made available more buses will be added paralleling the railway lines and serving new districts. The fare on the city bus is 1 cent less than that charged by the railway.

The railway is telling its side of the controversy to the public through the *Key Route News* and in large newspaper space. The company says that the Railroad Commission after receiving a favorable report on the one-man safety cars from W. J. Handford, its service inspector, recommended on Aug. 13, 1918, the purchase of twenty-five Birney one-man safety cars as a matter of economy in the company's operations. At that time there was an ordinance which prohibited the operation of cars by one man, but the company, desiring to act upon the recommendation of the Railroad Commission, presented the

entire matter to the City Council, indicating that it contemplated the purchase of twenty-five Birney one-man safety cars. As a result the ordinance which prohibited operation of cars by one man was repealed. This was in the fall of 1918. Among those who voted favorably on the repeal measure when it was before the Council was the present Mayor, Mr. Davis.

The railway, with the approval of the Railroad Commission and the consent of the City Council, proceeded to purchase the cars at a cost of \$168,445. This purchase and its financing were approved by the Railroad Commission on June 7, 1920. These are the cars against which protest is now made. As the company explains:

These cars were put in service in August, 1920, and have been operated more than 2,600,000 miles and have carried more than 13,700,000 passengers, in safety, without protest or complaint, until, politically, they were claimed to be unsafe, by the passage of the last ordinance, a few days ago.

In a subsequent statement the company said:

From what we have said it sufficiently appears that the company has made investments approaching \$1,000,000 in cars of this character. It has operated cars of this type upon the streets of Oakland for more than three years without protest or opposition. This has been done with the consent and approval of the Railroad Commission of the State of California, to which the citizens of Oakland surrendered the powers to consider and act upon such matters. The company cannot surrender the right to operate this equipment, thereby submitting to the confiscation of this property, without a judicial determination of the question whether its operation is to be carried on in accord with the regulations and subject to the approval of the Railroad Commission of the State of California, or the City Council of the city of Oakland.

Our company cannot operate under two masters. The law vests jurisdiction in one or the other. The question is: Which? All parties in interest will be benefited by the determination of this question, and until such determination is had, the company must insist upon its right to continue to operate as heretofore.

With its case thus presented the company explains that it leaves with the public for decision the question of which side to the controversy has acted in good faith.

Although strong appeal had been made for the repeal of the ordinance prohibiting the operation of jitneys the latest advices indicate that the Council has rejected by a vote of three to two the idea of giving the jitneys free rein again.

In the heat of the controversy over the question of the operation of one-man cars, the matter of service and fares has been relegated to the background for the time being, although the fare matter has come up incidentally at the recent hearings in connection with the proceedings before the Railroad Commission looking toward approval by that body of the recently submitted financial reorganization plan.

\$36,874,951 Traction Fund

Chicago Re-establishes Relations With
Railways, Broken When Thompson
Was Mayor

Chicago's traction fund now totals \$36,874,951. It was increased to this amount on Oct. 20, when city officials accepted checks totaling \$8,189,158 from the railway officials.

Acceptance of this sum, the city's 55 per cent of the net receipts of the railways for four years, was the last step in Mayor Dever's re-establishment of relations with the traction companies which were broken off during former Mayor Thompson's administration.

The checks offered and accepted by the city were the same tendered to and refused by former Mayor Thompson, who had caused the franchise of the Chicago Surface Lines to be canceled by the City Council and who feared that acceptance of the money would prejudice suits pending in the courts to enforce the cancellation. The Chicago City Railway paid \$2,809,379, while the Chicago Railways turned over \$5,379,758. These two companies are comprised in the Chicago Surface Lines.

Fourteen checks in all were accepted by City Comptroller Martin J. O'Brien. They represented the city's share of the companies' profits payable each year from 1920. The dates and amounts of each check follow:

From the Chicago City Railway:	
April 10, 1920	\$442,991
April 9, 1921	737,989
April 10, 1922	685,373
April 10, 1922	390,372
April 10, 1923	276,327
April 10, 1923	276,327
Total	\$2,809,379
From the Chicago Railways:	
April 9, 1920	\$1,004,372
April 9, 1921	706,626
April 9, 1921	700,000
April 10, 1922	858,367
April 10, 1922	500,000
April 10, 1922	500,000
April 10, 1922	500,000
April 10, 1923	610,393
April 10, 1923	500,000
Total	\$5,379,758

Whether the city is entitled to interest on the funds which were held in trust by the companies after the former administration's refusal to accept the checks may still be the subject of controversy. The traction fund was created for subway construction by the terms of the 1907 franchise ordinances under which the companies operate.

The forfeiture suits filed against the railways during the administration of former Mayor Thompson have been dismissed on the motion of Corporation Counsel Busch.

Oklahoma Road Damaged

Canadian River on Rampage Washes Out Track of Interurban—Water Unusually High

Heavy losses to track and roadway were sustained during October by the Oklahoma Railway due to the flood waters of the north fork of the Canadian River. On the morning of Oct. 15 water covered a mile of track on the El Reno Division just east of Banner, Okla., and all through traffic between Oklahoma City and El Reno was discontinued. On the evening of Oct. 15 the flood again struck the El Reno Division and took out 280 ft. of trestle and 100 ft. of dump at the crossing of the Canadian near stop 17. This same rising of the river washed 1,500 ft. of track off the fill near stop 20 and cut out 500 ft. of fill to a maximum depth of 18 ft. at stop 21. The crest of the flood reached Oklahoma City early in the morning of Oct. 16, bringing with it the water loosed by the cutting away of the core wall at the City Reservoir, 8 miles west of the city. The river reached a stage of 22.5 ft., which was 6.2 ft. higher than the record set by the flood of June, 1923.

The Stock Yards line was under water for a distance of $\frac{3}{4}$ of a mile and badly washed out. The Walker Street line used jointly for city and Norman Division traffic was washed out, 380 ft. of trestle and 1,400 ft. of dump being taken. The Central Avenue Line was under water for $\frac{3}{4}$ of a mile, track lined off the dump, 140 ft. of trestle washed out and heavy cutting made at various places.

Traffic between Oklahoma City and

El Reno was resumed on Oct. 20 after a ferry had been installed at the river crossing at stop 17, the track at stop 20 replaced, a shoo fly constructed around the washout at stop 21, and high-line trolley and feeder line restored. While the tracks on Exchange Avenue were still under water, gangs were put to work, the outbound track was raised on sand bags and light cars were operated on Oct. 21. Traffic between the north and south part of the city was shut down six days. Due to the river changing its course, on South Walker Street and Central Avenue Line, additional trestles will be necessary before traffic can be restored on these two lines. A total of 800 ft. of trestle and approximately 1 mile of track will have to be rebuilt there.

Gerard Swope to Give First Aldred Lecture

Gerard Swope, president of the General Electric Company, has accepted the appointment of first Aldred lecturer at the Massachusetts Institute of Technology, Cambridge. The opening day of the course is Nov. 9. These lectures have been established by J. E. Aldred of Baltimore, who has been responsible for similar lectures bringing leaders in science and industry into other educational curricula, thus tying the interests of engineering students more closely into those of the business world. Other eminent industrialists and engineers are to complete the Cambridge program for the first year, which will consist of twelve lectures. This year's lectures will be open to the faculty, seniors and graduate students of the Institute and to a limited number of outsiders, and

will probably be published for general distribution next spring. President Stratton has appointed Prof. D. C. Jackson, head of the department of electrical engineering, and Prof. V. Bush, in charge of graduate work in electrical engineering, to co-operate with Mr. Aldred in this work.

Subway Program Promised by Chicago Mayor

Mayor Dever of Chicago has announced that a committee of experts is making a study of a plan to begin construction of subways soon without waiting the outcome of negotiations for municipal ownership of the local transportation systems. In explaining his position, Mayor Dever said:

I have never said that subways would have to await a solution of the surface and elevated lines question. Subways will be an integral part of any solution of the transportation problem and as such are now being considered by my advisory staff in its study of plans for the unification of transportation facilities.

A subway system and a comprehensive subway system are two different things. We have enough money in the traction fund, or will have when the Surface Lines' \$8,000,000 is added, bringing the total to approximately \$40,000,000, to build all the subways necessary for Chicago.

If the only question involved was a financial one we could begin tomorrow to dig subways and build 20 miles of rapid transit lines with the money in hand. But other problems enter into any discussion of the subway question. For instance, it must be determined what we will do with the subways when built. Shall the city operate them or would it be well to lease them to private enterprise? And, if they are leased to an operating company, would it be possible for it to guarantee the city against loss and still maintain a low, reasonable fare?

The Mayor has promised as soon as a conclusion is reached to announce a program which will give Chicago the best possible transportation with the most practical subway system.

Havoc and Destruction Wrought by Flood Waters on Oklahoma Property

New Plan Promised

Five-Cent Fare Inadequate Under Existing Conditions in Jersey—Modified Settlement Plan Coming

Within a short time the Public Service Railway of New Jersey will offer a modified plan for the settlement of the present transportation problem there, free from the objections that were raised to the former plan. Announcement to this effect was made by President T. N. McCarter of the company on Nov. 1. Mr. McCarter said that a month's trial of the 5-cent fare in local areas in the more important municipalities has shown that under existing conditions the 5-cent rate will not produce "the cost of service." His statement follows:

The experimental 5-cent rate of fare adopted by Public Service Railway at the suggestion of the Board of Public Utility Commissioners has now been in effect in the populous centers of the state for one month. The public, generally, has shown an appreciation of the 5-cent fare plan and a desire that it be made permanent. The results, however, indicate that this will be impossible if the street railway and the buses continue to operate in competition with each other. The number of passengers on the street cars has increased, but not in sufficient numbers to make up for the reduction in fare. Consequently the rate is not producing the revenue received from the former rate before the cessation of service and is not providing the cost of service.

Co-ordination of street railway and bus service under one management with proper state and municipal supervision will furnish the only possible solution of the transportation problem. Such a plan will end uneconomic and wasteful congestion and provide the only hope for the continuance of the 5-cent fare on both cars and buses. The present situation cannot be indefinitely continued.

The railway will undertake to furnish such a co-ordinated railway and bus service and will operate both cars and buses to the extent found necessary to accommodate the traffic. If this requires the acquisition of the buses now legally operating the company is prepared to act. Within a short time the company will offer a modified plan, free from objections that were raised to its former plan, to accomplish the result so necessary for the public convenience. To bring such a plan to a successful consummation will require the active co-operation and assistance of the state and municipal authorities.

The original plan of settlement for the transportation difficulties was suggested by President McCarter on Aug. 21. Very briefly, the company offered to take over competing buses at their then existing physical value and run a co-ordinated bus and car service at a 7-cent fare. City officials opposed increasing the bus fare to 7 cents, as would be done under the Public Service plan. The trolleys continued idle until the chancellor ordered the company to restore operation at the 8-cent rate. At about the same time the cars started, the Public Service filed with the Public Utilities Commission a 10-cent fare schedule. The commission suggested to the company that it try a 5-cent rate within city limits. After deliberation the company announced that it would give the plan a four-month trial beginning on Oct. 1.

New Proposition Submitted.—In accordance with votes recorded by the carmen's unions recently a new proposition has been submitted to the Worcester Consolidated Street Railway and

the Springfield Street Railway. It includes demands for wage increases, change to the day rate pay basis and changes in working conditions, all to take effect on Jan. 1. Details of the demands have not been made public, but public conferences will be arranged soon.

Conditions Can't Continue in Youngstown

"A continued deficit in this fund without probability of payment from operating receipts would naturally result in the discontinuance of the street railway service, unless some other means may be found by the city or company of working out the original plan." This is the finding of a special legal committee appointed by the legislative committee of the Chamber of Commerce of Youngstown, Ohio, to make an investigation into the financial condition of the Youngstown Municipal Railway. The abstract of the service-at-cost plan which was in preparation for several months by the committee was submitted and approved at a meeting of the legislative committee. It will be used by the latter committee in the preparation of an exhaustive report on the transportation situation.

The findings refer to the ordinance which gives the company the right to operate under a guarantee on behalf of the city to charge a rate of fare which will earn sufficient revenue to pay the operating allowance and maintenance, repairs and renewals. The report states that this amounts at the present time to 25 cents per car-mile for operating allowance and 7.83 cents for maintenance,

repairs and renewals. In addition the gross revenue should pay taxes and a return. The company is further permitted when the stabilizing fund is below \$50,000 to increase its rate of fare and when the fund is increased to \$150,000 to decrease its fare. The report points out, however, that the guarantee of the city does not impose upon it an obligation that at the rate of fare charged the gross income will be sufficient to pay the stipulated return on its capital value or in fact even to pay the operating cost. Further, the city merely contracts and agrees that the company may operate on this plan, and that in case the stabilizing fund should be found insufficient then the preservation of the stabilizing fund would be purely a company matter.

From the fact that there now exists in the stabilizing fund a deficit of \$900,000, it would appear that results under the rates charged have not accorded with the original purpose of the ordinance which was to earn enough from operation to preserve the service at cost without permanently depleting the stabilizing fund.

Improves Service.—The Eastern Wisconsin Electric Company has practically doubled its service accommodations for patrons between Sheboygan and Plymouth.

Truth About Utilities.—The American Development Publicity Association recently published a series of articles in the *New York Evening Mail* on the truth about public utilities.

Wants Statement Corrected.—W. E. Wood, manager of the Houston Electric Company, wishes to correct a statement of John A. Beeler which appeared in the Sept. 22 issue of the *ELECTRIC RAILWAY JOURNAL* to the effect that the average speed for cars in Houston was 6 m.p.h. Mr. Wood says the correct figure is 9 m.p.h. and has been for some time.

Asks to Remove Tracks.—The Philadelphia Rapid Transit Company has petitioned the commissioners for permission to remove tracks and wires from Christian Street between Sixth and Eighth and from Filbert between Eighth and Ninth. The removal is requested to permit new paving of the streets. An ordinance recently passed by the City Council providing for the removal contains also a clause providing for the relaying of the tracks in the future, if found necessary.

Richmond Committee Ready to Proceed.—Petitions are before the committee on streets of the City Council of Richmond, Va., from practically every civic and commercial organization in the city, asking the committee to proceed with the consideration of the proposed new blanket franchise for the Virginia Railway & Power Company. According to the chairman, the committee is ready to do this, "provided other matters are not injected into the deliberations of the committee by citizens themselves."

Kewanee Pays the Price of Neglect

RESIDENTS of Galva and Kewanee, Ill., are paying the price of their neglect of the Galesburg & Kewanee Electric Railway. Like many other humans they didn't recognize a good thing when they had it. Closeness to the object destroyed their sense of appreciation. And so the electric railway, after making a vain fight to keep going, quit and then sold out. The second-hand man has the road now. His husky disciples of destruction are expected to begin their work of demolition most any day. In a sense, the road's problems have been solved for it. But former patrons are beginning to pay the price of their neglect. They are now paying 76 cents to ride one way by bus between Galva and Kewanee instead of 36 cents charged on the defunct interurban. And they are howling. Although service has been shut down only a short time petitions are being circulated beseeching the local Chambers of Commerce to see what they can do about having the service restored.

Financial and Corporate

\$938,467 Earned by Detroit Municipal

The gross revenue of the Department of Street Railways of the City of Detroit for the fiscal year ended June 30, 1923, was \$20,196,163 and the operating expenses exclusive of taxes were \$14,450,613, leaving a net revenue of \$5,745,550. As the charter specifies that taxes shall be levied on the physical property of the entire system the same as though privately owned, a deduction of \$639,745 was made for this purpose, leaving an operating in-

come of \$5,105,805, which was augmented by non-operating income to \$5,178,707. Interest, sinking fund and amortization payments reduced this gross income to \$938,467 which was transferred to the profit and loss account. These figures, shown in an accompanying table, are all contained in the department's first annual report, just issued.

The deficit of \$2,369 in motor bus operations is stated to be due to the payment of \$600 per month rental on the two buses, which however may be applied on the purchase price.

The status of the city's investment

is shown in the balance sheet, reproduced herewith. The city has spent over \$15,000,000 in new construction and over \$21,000,000 represents the property secured from the Detroit United Railways. Against a total of \$38,307,785 investment in the property obligations to a total of \$34,419,304 are outstanding, of which \$15,880,000 represents the outstanding amount of the D. U. R. purchase contract, which has been reduced by payments which will retire the debt by Dec. 31, 1931.

The city is now operating 373 miles of single track and 1,673 passenger cars, of which 1,603 are owned and seventy leased. Of the total 1,171 are two-man motor cars, 252 trailers and 250 one-man. The average number of cars in the shop for repairs, painting and cleaning is 140.

The city operated 49,334,286 revenue passenger car-miles and 86,916 non-

DETROIT DEPARTMENT OF STREET RAILWAYS CONDENSED INCOME STATEMENT FOR THE FISCAL YEAR ENDED JUNE 30, 1923

	1,709,093
Total liabilities	\$42,824,079

revenue, making a total of 49,421,202. The passengers carried totaled 471,070,493, of which 357,386,437 were revenue and 113,684,056 transfer.

The total number of employees on the payroll was 6,525. A summary of the payroll is given by departments in an accompanying table which is condensed from that given in the report.

Regarding depreciation, the report states:

A depreciation charge, as such, was not made during the year, but the gross income was reduced by sinking fund charges which it is believed were larger than any reasonable estimated basis for depreciation, with the result that the net income as here shown affords a proper and accurate basis of comparison with the reports of privately operated utilities.

Considerable attention is given in the report to ways and means for speeding up street car passenger travel in the city of Detroit. By actual riding and timing it takes, during the evening rush hour, from fifteen to eighteen minutes to travel 1 mile in the central business area. It is imperative, states the report, that street car service in this district be placed underground in surface car dips at the earliest possible date.

The "Journal's" Analysis of the Detroit Figures

High Traffic Density a Major Factor in Success of Department of Street Railways—Low Taxes and Interest Rates and Assistance of Other City Departments Also Help to Make a Favorable Showing

THE interest that exists in the railway field regarding the operation of the street railway system of Detroit by the municipality has prompted the ELECTRIC RAILWAY JOURNAL to make a hurried analysis of the figures submitted in the first annual report of the Department of Street Railways, City of Detroit, just issued for the year ended June 30, 1923, as shown on the preceding pages.

Several factors stand out as contributing materially to the measure of success that has been attained. There has been a remarkable increase in population. This, in the absence of any important extensions of track for several years, has resulted in an exceedingly high traffic density—a most favorable situation for the railway. Taxes

charged against the railway are much lower in proportion to earnings than for private companies. The street railway department receives favorable treatment as compared with the private company in the matters of paving and rate of interest, and obtains the services of the city legal, purchasing and accounting departments for a large amount of work normally charged against the car rider instead of the taxpayer.

On the factor of growth in population, it may be noted that prior to the acquisition of the car lines in the city by the Department of Street Railways, the Detroit United Railway operated an extensive system, comprising interurban lines extending across Michigan and into Ohio, in addition to the city lines. For 1921, the last year of full operation, the total gross earnings of the entire D.U.R. system were \$23,329,067, or only 22 per cent in excess of the revenue of the department for the city lines in Detroit alone in the fiscal year ended June 30, 1923.

POPULATION GROWTH IN DETROIT REMARKABLE

This remarkable growth is due to favorable industrial conditions in the Detroit area which have made the city the fourth in size in the United States and have resulted in a great amount of added street car riding along with the increase in population. This growth in business has not been met with a corresponding increase in track mileage, although a program has been laid out by the city that will increase the trackage materially. The result is that the rate of earning on the existing permanent investment is much higher than the average for street railways in the United States. This is indicated in Table I, which gives a comparison between the Detroit figures and corresponding figures for 121 privately owned urban electric railways reporting to the American Electric Railway Association. The operating revenue per mile of track in Detroit is at the rate of \$54,145, as compared with \$28,310 for these roads, or more than 90 per cent above the average.

The density of street car travel is indicated by the number of revenue passengers per car-mile, which is 7.2, as compared with 6.6 for the 121 railways. The total passengers per car-mile is 9.5, as compared with 8.4 for the 121 roads. These two ratios average about 10 per cent higher for Detroit. This explains why, with an average fare of 5½ cents, as against 6.7 cents for the other roads, the passenger revenue per car-mile for Detroit was 40.8 cents, as compared with 44.6

FISCAL YEAR ENDED JUNE 30, 1923

Group I—Way and Structures					
1	Superintendence of way and structures	\$156,973	53	Fuel for power	539,021
2	Ballast	55,672	55	Lubricants for power	8,253
3	Ties	17,835	56	Miscellaneous power plant supplies and expenses	8,595
4	Rails	14,146	57	Substation employees	16,467
5	Rail fastenings and joints	27,011	58	Substation supplies and expenses	1,919
6	Special work	209,042	59	Power purchased	1,210,466
8	Track and roadway labor	572,261		Total	\$2,061,594
9	Miscellaneous track and roadway expenses	99,888	Group IV—Conducting Transportation		
10	Paving	224,022	63	Superintendence of transportation	\$279,620
11	Cleaning and sanding track	73,219	64	Passenger conductors, motormen and trainmen	6,064,111
12	Removal of snow and ice	59,490	66	Miscellaneous car service employees	65,939
16	Crossings, fences and signs	7,813	67	Miscellaneous car service expenses	263,839
17	Signal and interlocking apparatus	9,839	69	Station expenses	28
18	Telephone and telegraph lines	771	70	Carhouse employees	856,362
19	Miscellaneous way expenses	12,967	71	Carhouse expenses	37,253
20	Poles and fixtures	33,139	72	Operation of signal and interlocking apparatus	39,886
22	Distribution system	134,722	73	Operation of telephone and telegraph lines	9,469
23	Miscellaneous electric line expenses	89,380	76	Freight and express collection and delivery	154
24	Buildings, fixtures and grounds	130,386	78	Other transportation expenses	24,534
28	Equalization—Way and structures	39,000		Total	7,641,195
	Total	\$1,967,576	Group V—Traffic		
Group II—Equipment			80	Advertising	\$1,842
29	Superintendence of equipment	\$63,245		Total	1,842
30	Passenger and combination cars	734,443	Group VI—General and Miscellaneous		
32	Service equipment	17,244	83	Salaries and expenses of general officers	\$36,542
33	Electric equipment of cars	281,400	84	Salaries and expenses of general office clerks	152,491
36	Shop equipment	43,396	85	General office supplies and expenses	54,304
37	Shop expenses	67,876	86	Law expenses	1,119
38	Vehicles and horses	6,316	89	Miscellaneous general expenses	24,217
39	Miscellaneous equipment expenses	68	92	Injuries and damages	684,693
44	Equalization—equipment	45,000	93	Insurance	48,522
	Total	\$1,258,988	94	Stationery and printing	88,444
Group III—Power			95	Stores expense	280,632
45	Superintendence of power	\$29,531	96	Garage and stable expenses	60,670
46	Power plant buildings, fixtures and grounds	10,177	97	Rent of tracks and facilities	66,901
47	Power plant equipment	72,798	98	Rent of equipment	20,882
48	Substation equipment	16,282		Total	1,519,417
49	Transmission system	282		Grand Total	\$14,450,612
52	Power plant employees	147,803			

cents. While the base fare was 5 cents in Detroit during the period, an additional cent was charged for a transfer. This charge brought in a material added revenue and offset to some extent the lower base fare.

ANALYSIS OF OPERATING COSTS

A comparison of the operations for Detroit with those of the other companies has been worked out on the basis of per cent of gross in Table II. It shows some striking differences. The operating ratio is almost the same for

TABLE I—OPERATING STATISTICS OF 121 PRIVATE URBAN ELECTRIC RAILWAYS FOR CALENDAR YEAR 1922 COMPARED WITH DETROIT FOR FISCAL YEAR ENDED JUNE 30, 1923.

	121 Railways	Detroit
Railway operating revenue per mile of single track	\$28,310	\$54,145
Passenger revenue per mile of single track	\$27,593	\$51,154
Passenger revenue per car-mile, cents	44.6	40.8
Revenue passengers per mile of single-track	408,968	958,140
Revenue passenger per car-mile	6.6	7.2
Total passengers per mile of single track	522,078	1,262,923
Total passengers per car-mile	8.4	9.5
Transfer passengers, per cent of revenue passengers	26.5	31.8
Car miles per mile of single track	61,828	132,496

the two, being 71.6 per cent for Detroit as compared with 71.7 per cent for the others. The distribution of the operating costs is quite different, however. In Detroit less was spent proportionally for all items except transportation, which was 6.4 per cent higher. The way and structures expenditures were not materially different in the two cases, although Detroit must have been relieved of a considerable amount of the paving burden, judging by the fact that only \$224,022 was spent on this item with 373 miles of track. To offset this, a considerable amount of track in the system taken over from the D.U.R. was in bad condition and has needed excessive repairs. Expenditures for equipment are considerably lower for Detroit, probably due to the large number of new cars that have been placed in service within the year, and on which repairs should be light. Power cost is slightly less in Detroit than for the average. The streets are fairly level, stops are well spaced out, and a large number of trailers and safety cars are in use.

The general and miscellaneous expenditures are materially lower in Detroit, being 7.5 cents as compared with 9.4 cents for the 121 private roads. This is due to several things. In the first place, the accident record has been good, and the accruals to the injuries and damages fund have been kept down accordingly. The legal work in connection with claims is handled almost entirely by the city's legal department and is not charged against street railway operations, the total law expenses charged being only \$1,111. Then, too, persons are not so likely to bring suit against the city as against a private corporation, either because they feel the cost will come back in the form of taxes, or because they fear that it is useless to expect large judgments against the city. In addition to the accident situation, other city departments are called on to give service to the street railway department as occasion demands. For instance, all purchases are made through the city's purchasing department except in the case of special items.

It is patent that the amount charged to taxes, 3.2 per cent of the gross, is much less than for the usual street railway, being only 43 per cent of that for the other companies. In the charter of the city it is provided that taxes on the physical property of the entire street car system be levied, the same as if privately owned. This does not, however, include taxes at the rate charged in many other cities, which frequently runs 5 to 7 per cent of gross. Furthermore, no federal taxation at all has to be included, as this is a department of the municipality, and hence exempt under the law.

The auxiliary operations of the private companies as reported provided net revenues just about sufficient to offset the lower rate of taxation enjoyed by the city, so that the net operating income is not far different in the two cases. The non-operating income of the private companies is considerably the greater, so that the gross income applicable to bond interest, dividends and surplus is somewhat higher for the 121 roads.

The income deductions in the case of Detroit are considerably more. The city is paying interest on bonds cover-

ing the entire investment made in the property. Certain critics have claimed that this is less than the real value of the system, and that the D.U.R. was forced to sell at a loss. Be that as it may, the city is paying interest at the current rate for municipal loans, averaging about 5½ per cent as against 6 to 8 per cent demanded today from private railways. It is also applying earnings to a sinking fund to retire the bonds over a period of about thirty years. Since the investment will be wiped off the books at the end of that time, the city states that it does not need to set up a depreciation fund in addition.

Auction Sales in New York.—At the public auction rooms in New York there were sold on Oct. 31 \$2,000 Des Moines & Central Iowa Electric Company 5 per cent bonds due 1937, interest March and September 84 per cent; and forty shares Interborough Consolidated Corporation \$11 lot.

Files Judgment.—Judgment for \$7,832 has been taken by the Fowler State Bank at Rantoul against the Kankakee & Urbana Traction Company, Urbana, Ill., in Circuit Court during a special session of the court. The sum represented money advanced to the company by the bank.

Partial Abandonment Permitted.—By permission of the State Public Utilities Commission, the Fort Collins Street Railway, owned by the city of Fort Collins, Col., will abandon and dismantle that part of its roadbed which extends beyond the corporate limits of the city. There was no opposition.

Stockholders Approve Abandonment.—Abandonment of that part of the road from Garden and Stevenson Streets, Seneca Falls, to Cayuga Lake Park, has been voted by the stockholders of the Geneva, Seneca Falls & Auburn Railroad, Seneca Falls, N. Y. Application for the abandonment will be made of the Public Service Commission.

Files Abandonment Petition.—The Buffalo & Lake Erie Traction Company, through its attorneys, has filed a certificate of abandonment in the office of the Secretary of State, of that portion of its line or road known as the Dunkirk and Point Gratiot line. The line is operated in the city of Dunkirk. It is alleged that the further operation of this line is not considered necessary for the public convenience.

Bonds Issued in Exchange.—The Board of Public Utility Commissioners has granted permission to the Trenton & Princeton Traction Company to issue its 6 per cent gold bonds to the amount of \$500,000 to be used in exchange for the 4 per cent bonds of the New Jersey & Pennsylvania Traction Company. The board also approved a mortgage given by the former company to the Northern Trust Company, as trustee.

Initial Preferred Dividend.—The United Gas & Electric Company, New York, N. Y., has declared a dividend of thirty-five-thirty-sixths of 1 per cent on the new preferred stock for the period

TABLE II—OPERATING RESULTS OF 121 PRIVATE RAILWAYS FOR 1922 COMPARED WITH DETROIT FOR FISCAL YEAR ENDED JUNE 30, 1923

	Per Cent of Gross 1921		Cents per Car-Mile 121	
	Railways	Detroit	Railways	Detroit
Operating revenue	100	100	45.7	40.8

Total	71.7	71.6	32.8	29.2

of July 20 to Oct. 1, putting the stock on a 5 per cent annual basis. The dividend was paid on Oct. 1 to stock of record Sept. 27. The dividend is equivalent to approximately 97 cents on the 64,994 shares of new preferred outstanding.

Considers Abandonment Request.—The Georgia Public Service Commission has taken under advisement a recent request by the Chattanooga Rapid Transit Company, a subsidiary organization of the Chattanooga Railway & Light Company, of Chattanooga, Tenn., to abandon the interurban line operated by the former company between Ross-ville and Fort Oglethorpe, Ga. Members of the commission visited the line to investigate the advisability of permitting its abandonment.

Property Sold.—The property of the Henderson Traction Company was sold on Oct. 27 by court order to W. H. McCurdy, of Evansville, Ind., for \$6,800. Attorney A. H. Funkhouser, of Evansville, made the highest bid. The city of Henderson held prior lien on the property for \$4,588 for street oiling tax. The purchaser would not make a statement as to his intentions, but it is understood that he will remove the rails and other equipment and sell it for junk.

Bus Lines Unprofitable.—Street Railway Commissioner Engle of Youngstown, Ohio, recently stated that the buses operated by the Pennsylvania-Ohio Electric Company do not pay. For the month of September the earnings were \$21,327, which represented a loss of 2.84 cents per car-mile. The mileage for September was 91,043, with earnings per car-mile of 23.42 cents. According to Mr. Engle's figures the Hillman Street bus is the only line that shows a profit.

Reports a Gain.—For its first quarter of 1923 ended Sept. 30 the Brooklyn-Manhattan Transit Corporation reports a gain of approximately \$50,000 in the net operating income compared with the corresponding quarter of 1922. The company received in operating revenue \$9,681,053. This was \$544,920 more than the Brooklyn Rapid Transit Company received in the same period last year. Operating expenses were \$6,485,725 compared with \$5,994,057 in 1922. The net income for the period ending Sept. 30 of this year was \$814,696.

Denies Abandonment Application.—At a recent hearing before the California Railroad Commission it was brought out that the Nevada County Traction Company operating an electric line between Grass Valley, Calif., and Nevada City since 1901 was insolvent. It was stated that the company had defaulted interest on \$60,000 of outstanding bonds since 1921. The loss of revenue was ascribed to the rapid increase of private automobiles. It was stated, however, that the directors had not authorized any application for abandonment or substitution of service and that no application was before the commission. Bus franchises are being sought.

Improvement in Securities Noted.—Public utility securities have improved greatly their investment position in the first half of 1923 as is shown by the decline in the average yield of public utility bonds and in the decrease of the average disparity between municipal credit and public utility credit. This conclusion is based on an analysis by Herbert B. Dorau of the Wisconsin University Research Institute staff of the comparative borrowing power of twenty-five public utility companies and fifteen municipalities.

Lines Sold.—The Galesburg & Kewanee Electric Railway, Galesburg, Ill., has been purchased by Dave Wine, Kewanee, for \$50,000. Service on the line has already ceased. While the road was acquired by Mr. Wine primarily for its value as scrap, he announced that he would give the citizens an opportunity to retain the service if arrangements could be made. Immediate cessation of operation was necessitated, he said, in view of the fact that no arrangement had been made by him for protection from liability in case of accidents.

Assessment Left as Recommended.—The Missouri State Board of Equalization has completed final figures on the tax assessments of public service corporations operating in Missouri. The grand total is \$381,503,313, which is nearly \$2,000,000 less than the total for the same class of property in 1922, and \$4,128,945 less than the total recommended by the State Tax Commission. The valuation on street and electric railways amounted to \$65,987,881.

The assessment of the United Railways, St. Louis, was left at \$44,085,208 as recommended by the State Tax Commission. This is slightly less than the 1922 total.

Property at Newburgh Foreclosed.—The line of the Orange County Traction Company, running from Newburgh to Walden, N. Y., has been sold under the foreclosure of the mortgage against it. The property was bid in by ex-Governor Benjamin B. Odell, president of the company, acting for a committee representing the security holders.

His bid was for \$10,000 in addition to liens prior to the mortgage which was being foreclosed. This was held by the National Commercial Bank of Albany as trustee. The prior liens, including mortgage, judgment, interest, taxes, &c., amounted to \$579,192. The mortgage foreclosed was to secure \$750,000 bonds, of which \$324,000 had been issued under the mortgage and on which was due a total of \$378,748.

Record for Passenger Traffic.—The Chicago Surface Lines broke all records for passengers carried and receipts on Oct. 20. The receipts for the day were \$180,141, the previous high record having been \$178,487 on Dec. 23, 1922.

There were carried 2,611,532 cash fare passengers on that day, and it is officially estimated that there were 1,828,060 transfer passengers, so that there was a total of 4,439,592 people transported by the surface lines, or more than the entire population of the city

of Chicago. It is probable that the surface lines will break all records for passengers carried this year. Up to Oct. 20 the Surface Lines had carried approximately 587,371,135 cash fare passengers, or 9.37 per cent more than in the same period of 1922.

Increase in Capital Stock Proposed.—The stockholders of the Carolina Power & Light Company Raleigh, N. C., met on Oct. 22 to consider resolutions providing for increase in capital stock from \$8,500,000 to \$12,000,000, and changing common and preferred stock to a "non-par" basis. The present authorized capitalization is 50,000 shares of common stock and 35,000 shares of preferred stock, par value \$100. Under the proposed amendment of the charter there will be an increase of 10,000 shares of common stock and 25,000 shares of preferred stock, making 60,000 shares of each stock. The increase in capital is considered necessary in order to provide in part the cost of further additions in plants and equipment contemplated. The property of the company includes 15 miles of electric railway.

Proposes Bond Issue for Reconstruction.—An issue of \$200,000 in utility bonds to finance reconstruction of the Seattle Municipal Railway tracks, trolley wires and special work in the district bounded by Jackson and James Streets and First Avenue South and Third Avenue South is proposed in an ordinance recently introduced in the City Council. The issue is proposed as a substitute for the \$150,000 issue passed a few weeks ago, which was found to be insufficient. The bonds will be a lien against the railway, payable out of revenues. Plans for repaving the district have been held up because of lack of funds with which to rebuild the railway. The Seattle Municipal Railway has returned to the light and water department a loan of \$175,000 made three months ago, when the railway lacked funds to meet pay-rolls because of losses accrued under the 5-cent fare experiment.

Opposes Abandonment.—The International Railway, Buffalo, has applied to the Public Service Commission for permission to abandon the Niagara Falls Sugar Street line, with the result that the petition has become a matter of concern to the City Council, city manager, corporation counsel and other officials. Much opposition has been expressed on the proposed abandonment. President Walter McCulloh of the Chamber of Commerce says that the abandonment of this important cross-town car thoroughfare would be deplorable, in view of the fact that the upbuilding of that territory will be but a matter of a short time, when the paving of the streets as now planned is finished. In a rate hearing before the Public Service Commission several months ago, the International Railway set forth figures to show that the company's lines in Niagara Falls had been operating at a loss of some \$103,000 a year.

Traffic and Transportation

Change Made in Token Rate

Commission Orders District of Columbia Companies to Sell Three Tokens for Twenty Cents

Electric railways operating in the District of Columbia have been ordered by the Public Utilities Commission to sell three tokens for 20 cents at their carhouses, offices, substations, power station, "and other points convenient to the public," but not on their cars, effective on Nov. 1.

The order modifies to this extent the previous order for the general sale of six tokens for 40 cents. A general sale, by conductors on cars and elsewhere, of three tokens for 20 cents was asked by the Federation of Citizens' Associations on the ground that many persons did not find it convenient to purchase six tokens at a time. In the arguments at the hearing, counsel for the federation asked that if the three-for-20-cents order be denied, a cash fare of 7 cents instead of 8 cents be ordered. This phase was disregarded in the ruling of the commission as being outside the original petition.

While no official estimate has been made of the effect of the new order upon the revenues of the companies, it is not believed that it will be of much consequence, as most purchases of tokens are made on street cars and these are not affected by the order. Tokens heretofore have been sold at the company offices, carhouses and at certain banks in Washington and it is at such places only that three tokens for 20 cents may be purchased hereafter.

Testimony before the commission showed that about 20 per cent of the passengers of the Washington Railway & Electric Company pay the cash fare of 8 cents and it was estimated that if three tokens for 20 cents were sold on cars half of these cash riders would buy tokens and that the resultant loss in revenue to the company would be \$104,000 a year, based on the number of passengers carried in the twelve months ended Aug. 31, last. Similar testimony was not introduced for the Capital Traction Company, but the Utilities Commission itself made an estimate that 24 per cent of the passengers of that company pay the cash fare and that, on the same basis of estimates, loss of revenue by a general change in the quantity of tokens sold would be \$109,000 a year.

"The evidence submitted indicates that the returns now enjoyed by the railways are no greater than what is considered fair, and are decreasing," the commission asserted in its decision in the case. This sentence is considered especially significant as forecasting the attitude of the commission regarding the general question of railway fares in the District of Columbia, as there

has been agitation in Congress and elsewhere for a return to the 5-cent fare.

The effect of the sale of tokens in smaller quantities by the conductors would be to delay traffic movement "to a small extent," the commission asserted, because of the increased number of transactions between conductors and passengers.

"The riders who are in a position to spend 20 cents for three tokens and cannot spend 40 cents for six are probably few in number," the commission concluded in its opinion.

Injunction to Prohibit Buses Denied

An injunction to prohibit the operation of buses along the route of the Maumee Valley Railway, Toledo, was denied in the Lucas County Common Pleas Court on Oct. 25. The court in denying the injunction said that it was opposed to government by injunction proceedings.

The suit, which was brought by Attorney Leroy L. Eastman, representing the railway, charged that the bus companies were operating without first complying with the provisions of the Collister bus law. The Maumee Valley Railway, of which L. G. Van Ness is president, operates on both sides of the Maumee River, south of Toledo. Mr. Van Ness said that the matter would be taken to the Court of Appeals immediately.

Last year the village of Perrysburg, through which the interurban operates, passed an ordinance prohibiting buses from stopping to take on passengers within the corporate limits of the municipality. The bus companies went into court and obtained an injunction against the city. The matter was taken to the Ohio Supreme Court by Attorney Eastman, where he succeeded in having the injunction dissolved.

Will Start Auxiliary Bus Service in Springfield

Following the threat of the City Commission to repeal its anti-bus ordinance and permit general operation of buses on Springfield, Ohio, streets unless the Springfield Street Railway started some kind of service to the Melrose addition in accordance with its franchise terms the company recently notified the commission in special session that it would start auxiliary bus service to connect with cars on Nov. 5. The commission at a regular meeting on Oct. 29 gave the company twenty-four hours to make final reply to its ultimatum demanding service.

A resolution ordering the building of the new track was passed some time ago without a dissenting vote. When

the company was approached on the subject it declared it would be impossible to build the extension as a loss of \$10,000 had been incurred so far. The matter rested until a delegation of citizens from the Melrose addition appeared before the commission and pressed for action, with the resultant passage of the resolution threatening revocation of the franchise and repeal of the anti-bus statute.

Rehearing Called on Mail Pay

The Interstate Commerce Commission will begin a hearing at Washington on Nov. 19 on the application of the Post Office Department to readjust the compensation of electric railways for handling United States mails. This is a reopening of the case started in July, 1918, when the commission, on its own motion and following the suggestion of a bill enacted by Congress, ordered an investigation to determine reasonable rates for transporting mail by urban and interurban electric railroads and for the incident service.

It will be recalled that in August, 1920, the commission handed down an order which had the effect of increasing the compensation to the carriers, but the results were not satisfactory to the American Electric Railway Association, which filed an application for a rehearing. The Post Office Department in 1922 filed a petition for reopening of the case, on the grounds that conditions had changed since the 1920 order of the commission so as to justify revision downward of the rates.

Testimony and evidence in the case will be presented before an examiner for the commission, beginning Nov. 19, and the proceedings are expected to occupy several weeks. Eventually, arguments will be heard before the commission itself, after the examiner's report has been submitted.

Wisconsin Commission Authorizes Use of More One-Man Cars

The Wisconsin Railroad Commission has granted formal permission to the Wisconsin Public Service Corporation to continue the operation of one-man cars on its Green Bay-Kaukauna interurban line. The company pleaded the need of the strictest economy in operation, and submitted to the commission statements showing the difference in cost of operation that resulted from the change to one-man car operation and also data on accidents.

C. E. Kohlhepp, auditor for the company, said the railway department in Green Bay, including the city and interurban lines, had incurred a deficit of \$190,159 in 1922 and a deficit of \$94,818 in the first seven months of 1923.

C. E. Warwick, representing the company, testified that the one-man cars with the new safety appliances were as safe as the two-men cars. J. P. Pulliam, vice-president and general manager of the company, said that accidents have been materially reduced the last two years and that step accidents to passengers have practically

ceased with the operation of one-man cars. He said further that the saving resulting from the one-man cars would forestall an increase in rates.

This ruling of the commission followed close on the heels of its decision permitting the Eastern Wisconsin Electric Company to operate one-man cars between Neenah and Fond du Lac.

Traffic Signals to Be Installed in New Orleans

The sum of \$17,000 will be spent by the city of New Orleans for the installation of fifty additional electric traffic signals, in the near future, specifications for which are now being prepared by City Engineer Klorer. A traffic tower will be erected at Rampart Street and traffic signals installed from that point at all intersections of Canal Street to Peters Street and at other intersections. This improvement is based upon an agreement reached by the Commission Council of New Orleans with the Canal Street Merchants' Association, which is urging the adoption of that portion of the Beeler report governing regulation of traffic on Canal Street, thereby increasing the parking space for cars and relieving present congestion. The Canal Street Merchants' Association will bear \$7,000 of the expense of improvement.

Traffic Solution Prizes Total \$1,500

Prizes totaling \$1,500 were recently awarded in the traffic problem contest started in the Keith, Proctor & Moss vaudeville theaters, as a constructive contribution to the recent Silver Jubilee celebration of New York City. The winning suggestions were the best of more than 1,200 plans entered in the eliminating contests in twenty vaudeville theaters. All the capital prize-winners submitted their plans through the Palace Theater.

The winner of the first prize, who was the chief engineer of the Board of Estimate, offered three suggestions for the traffic solution in New York City. Among these was the substantial relief for the section adjoining Forty-second Street by making all north and south streets one-way streets, and introducing the block system of traffic control. The winner of the second prize suggested doing away with all sidewalks on principal streets and making arcades in front of stores. Another suggestion included vehicular subways, and still another proposed removing all trolley lines on streets running east and west, and constructing ramp bridges at all east to west crossings.

Taking Action on One-Man Cars

Representatives of local unions in Massachusetts associated with the Amalgamated Association were present at a recent special meeting for the purpose of formulating action on the elimination of one-man cars. They will back a law which provides that no car of any railway shall be operated with

fewer than two employees. Further, that the act if enacted by the Legislature shall be submitted for acceptance to the voters of each city and town in which a car is operated by one man and shall take effect in such cities and towns thirty days after acceptance.

Public Told About New Fort Wayne Cars

Letters to all automobile owners in the city, placards posted in practically all garages of the city, car cards and full page advertisements in the local newspapers are being utilized by the Indiana Service Corporation to announce a new type of street car now being placed on the Fort Wayne, Ind., city lines.

"There was a time when we put new types of cars in service and let the general public find out about them as best they could," says J. A. Greenland, superintendent of transportation and traffic. "That day is past, however, and now when we contemplate a change in service, especially such as at present, when the change will affect other street traffic, we make it a point to tell the public all about it."

The announcements are occasioned by the purchase of new type cars, with front entrance and rear exit. Cars now in use have front entrance and exit only.

Cars now in use on the city lines are single truck, front entrance and exit. As Mr. Greenland explains, the rear exit cars are expected to speed up traffic. They are also operated by one man.

There are twenty-five cars of the new type now being added to the city service. Of these, fifteen are new and ten have been rebuilt from double-truck cars formerly in operation and on which two men had been used. All city street cars are now in one-man operation.

Petition for Abolition of One-Man Cars.—Three hundred property owners living along the route of the June Street line of the Worcester Consolidated Street Railway have petitioned the Mayor and Aldermen for the abolition of one-man car service which was started recently.

Grants Bus Franchise.—A franchise has been granted the Monogahela-West Penn Public Service Company, operating lines in northern West Virginia, to operate a bus line between Morgantown and Rivesville. At the latter point connection will be made with the trolley cars for Fairmont. The company is expected to start this service as soon as the necessary equipment can be secured.

School Attendance Helps Railway.—Increased attendance at Teachers' College, resulting in greater patronage of its railway lines, caused a reduction in fare from 8 to 7 cents on the lines of the Waterloo, Cedar Falls & Northern Railway. C. D. Cass, general manager of the company, has promised further cuts "if patronage warrants."

Colored Lights Standardized.—The Tacoma Railway & Power Company has completed standardization of colored lights on the front of the various car lines of the company designed to make it easier for patrons to recognize their cars at night. Each color combination represents a particular car line and the company has advertised the change, so that all may familiarize themselves with their particular light.

Seek Fee Refund.—The Michigan Public Utilities Commission is investigating the operation of a large number of motor buses which have recently discontinued business whose operators are now seeking to get their application fee refunded to them. Most of them operated in a former resort territory and have been operating under a permit issued by the commission requiring their filing of necessary insurance and other papers.

Hears Petition for Increased Fares.—The Public Service Commission late in September held a hearing on the application of the City Railways, Wheeling, W. Va., for an increase in fare on its Mozart Park line in Wheeling. It was claimed by the company that the line was operating at a loss and was used to little extent. There were none present to contest the proposed increase of the company, which was represented by one of the management and Attorney John J. Coniff.

Perfect Thirty-one Days.—Keokuk car operators made their slogan "Thirty-one Days Without an Accident" a reality when they completed their safety first drive for the month of August. Telegrams of congratulation were received by the men shortly after from H. T. Edgar, division manager, and David Daly, district manager of Stone & Webster. Walter H. Burke, local manager of the Keokuk Electric Company, has given the men a dinner in recognition of their achievement. The drive was planned and directed entirely by the car operators.

More One-Man Lines Planned.—Five divisions of the Louisville & Interurban Railway lines will have one-man safety cars in use by Jan. 1, according to Richard H. Wyatt, general superintendent of the Kentucky company. One-man safety cars are to be placed in use on the Orell division Nov. 11 and on the Fern Creek division some time in December, Mr. Wyatt said. The safety cars are now in use on the Jeffersonton, Prospect and Okolona divisions.

Will Use One-Man Cars.—The Galveston Electric will soon install one-man safety cars in Galveston, according to an announcement by Raymond G. Carroll, vice-president and general manager. The installation of the one-man cars will be gradual, Mr. Carroll said, only one or two cars being put in service at first. It is planned, however, to convert the entire system to the one-man car. Mr. Carroll said that the number of automobiles in use in Galveston is the direct cause of the installation of one-man cars.

New Pass Plan.—Effective Nov. 5, the Pennsylvania-Ohio Electric Company will place in use on its interurban line between Youngstown, Ohio, and New Castle, Pa., two forms of the unlimited-ride weekly pass. One form, selling at \$3.75, will be used for transportation from terminal to terminal, or intermediate points, a distance of 19 miles. The other will sell at \$1.75 and will be used for transportation between New Castle and Edenburg, or intermediate points. This pass will be of advantage to suburban dwellers going to and from work and also for shopping in New Castle. It also will be of advantage to industrial riders from New Castle to Edenburg.

Dining Chair Coaches Ready.—The Interstate Public Service Company, Indianapolis, Ind., will put into service during the next few weeks Pullman combination dining and chair cars between Louisville and Indianapolis. The cars will be operated during the usual meal hours, and more will be put on as the patronage demands. First definite announcement of this improved service was made by L. M. Brown, general superintendent of the division. The cars, some of which already have been ordered, will be like standard equipment of the kind used on steam roads with the dining room at one end and the chairs at the other, with the kitchen separating them. The order has been referred to previously.

Fare Lowered.—A new fare schedule recently approved by the Public Service Commission authorizes a minimum charge in the fifty-trip commutation book reduced from \$5 to \$3.75 on the Auburn & Syracuse Electric Railroad. The order became effective Oct. 20. Fares heretofore applying for the sale of such commutation books for transportation to and from Auburn and to and from Syracuse are canceled. Fares to and from Auburn will be obtained by using the interurban commutation fare to and from Soule plus fifty times the regular one-way fare between Soule and Auburn. Fares to and from Syracuse will be obtained by using the interurban commutation fare to and from the city line plus fifty times the one-way city fare.

Petition for Old System.—All night service into Tremont Street subway in Boston was started Oct. 14. Petitions bearing 1,400 names of night workers have been presented to the railway protesting against the early morning car service and petitioning to put the night cars back on Adams Square. It is claimed that only those who work in the immediate neighborhood of Scollay Square, Park Street and Boylston Street stations are at all benefited by the new order. All the others who were used to getting the cars at their doors are forced to walk. It is their contention that conditions would be improved if the old service were restored, because most of them, tired after a night's work, might go from their work to the street and get the cars without a long walk being necessary.

Personal Items

F. de Lancker Heads International Tramways Union

General Manager of the Brussels Tramways Is Elected to Succeed Mr. de Burlet

C. de Burlet, honorary director general of the Société Nationale des Chemins de fer vicinaux of Belgium, resigned on Oct. 9 as president of the Union Internationale de Tramways de Chemins de fer d'intérêt local et de Transports Publics Automobiles. Mr. de Burlet has been president of the organization for the last eleven years. In his letter of resignation Mr. de Burlet says that it is with great regret that he retires from the presidency after an active association with the organization for more than forty years, but his advancing years and obligations of health compel him to do so. He feels that the recent convention in Brussels proves that in spite of the war, the association is as important and necessary to the industry as ever, and that the large attendance and notable success of that meeting show that it has taken on a new life and that the crisis in its existence has passed.

Although organized in 1885, the Union Internationale de Tramways de Chemins de fer d'intérêt local et de Transports Publics Automobiles has had only three presidents. The first was Gustave Michelet, then general manager of the Brussels Tramways, who was elected president at the organization meeting in Brussels. He continued in the office of president until his death in 1897. He was succeeded by Baron Janssen, then president of the Brussels Tramways, who occupied the office for fifteen years, when he was elected honorary president. Mr. de Burlet at the time of his election was general manager of the Société Nationale des Chemins de fer vicinaux, a large interurban railway property in Belgium under partial government ownership.

Mr. de Lancker, the new president, is general manager of the Brussels Tramways. His election has just been ratified by ballot by the members.

Messrs. Vance and Hendricks in Charge of Purchases of Merged Companies

Harry J. Vance, purchasing agent for the Illinois Power & Light Corporation, with headquarters at Peoria, Ill., has been made purchasing agent for the Illinois Traction, Inc. Mr. Vance will have his headquarters at Chicago.

W. P. Hendricks, for a number of years associated with the William A. Baehr Organization, consulting engineers, Chicago, will be the new purchasing agent for the Illinois Power &

Light Corporation, with headquarters at Chicago.

Harry Vance is well known throughout Illinois, having for many years been purchasing agent for the Illinois Traction System, which company became a subsidiary of the Illinois Power & Light Corporation last June.

Otto M. Rau Appointed on Power Survey

Otto M. Rau, an engineering specialist in hydraulics, power generation and natural resources, has been appointed in a consulting capacity on the staff of the Giant Power Survey of the Commonwealth of Pennsylvania. This survey has been started in Pennsylvania at the suggestion of Governor Pinchot. Mr. Rau will be located in a Philadelphia office which has been opened in the Fuller Building and will have charge of studies of power requirements, stations and transmission lines.

Mr. Rau's early experience was gained with the engineering department of the Edison General Electric Company, New York. He later became identified with the Milwaukee Electric Railway & Light Company as chief electrician and general superintendent of the lighting and power department. During the war Mr. Rau acted as consulting engineer to the power section of the Emergency Fleet Corporation. At the close of the war he became connected with Day & Zimmermann of Philadelphia in charge of public utility management and was later with the Stotesbury-Mitten management of the Philadelphia Rapid Transit Company where he did specialized work on pulverized fuels and making super-power studies. His appointment, together with that of Dr. Frederick H. Newell of Braddock, Pa., was made by Morris L. Cooke, director of the power survey and former director of public works in Philadelphia.

Mr. Doerr Leaves Connecticut Company

J. H. Doerr has resigned as roadmaster of the Connecticut Company, effective on Nov. 1, to become Western representative of the Railway Trackwork Company, Philadelphia, Pa. He will be located in Los Angeles, Cal. For the past three years Mr. Doerr has been stationed in Waterbury for the Connecticut Company.

Mr. Doerr was graduated from Sheffield Scientific School, Yale, in 1912, and entered the employ of the Connecticut Company in its maintenance of way engineering department. During his first four years with the Connecticut Company Mr. Doerr's work covered all branches of track engineering from layout to installation. At the completion

of this term of service he left the company and during the following four years engineered and supervised the construction of many industrial and power transportation projects. This work completed, he again associated himself with the Connecticut Company as roadmaster.

William S. Hamilton has resigned as general superintendent of the Schenectady Railway.

Thomas J. Lynch has been appointed general manager of the Schenectady Railway, Schenectady, N. Y.

Nat Ozmon has been appointed to succeed **Harry W. Cushman** as assistant superintendent of the Tri-City Railway, Davenport.

W. H. Rudisill is superintendent of engineering of the Manila Electric Company and **Maurice W. Toby**, formerly roadmaster, has now the title of engineer of maintenance of way.

E. Dobson is roadmaster of the Sarnia Street Railway, Sarnia, Ont., replacing in that capacity **William Bolton**.

C. W. Lightner is superintendent of line construction of the Bakersfield & Kern Electric Railway, Bakersfield, Calif.

F. M. Warnken has succeeded **B. K. Noble** as superintendent of the West Helena Consolidated Company, Helena, Ark.

R. M. Hannaford is acting chief engineer of the Montreal Tramways. **W. F. Graves** was formerly chief engineer.

George W. Scott has succeeded **Ralph Chandler** as second vice-president of the Phoenix Railway, Phoenix, Arizona. **L. M. Ford** is now treasurer, replacing **A. D. Haskell**, acting treasurer.

Loren Barton is vice-president of the Glendale & Montrose Railway, Glendale, Calif., succeeding **John Treanor**. Mr. Barton's office is located in the Corporation Building, Los Angeles.

Huey P. Long, chairman of the Louisiana Public Service Commission, has announced his candidacy for Governor of Louisiana subject to the action of the Democratic voters in the election to be held in January, 1924.

Dan. C. Smith, for seven years manager of the Fort Smith Light & Traction Company, has resigned and accepted a position with the Byllesby Engineering Company of Chicago, operating managers of the local utilities at Fort Smith, Ark.

Arthur E. Scott, manager of the Louisville branch of the Atlantic Tank & Barrel Corporation, Louisville, for a number of years, has recently accepted a position with the Interstate Public Service Company, Indianapolis, as director of public relations.

E. J. Rosenauer, formerly general auditor of the Southern Colorado Power Company, has resigned to become assistant treasurer and general auditor of the Wisconsin-Minnesota Light & Power Company, with headquarters at Eau Claire, Wis. Mr. Rosenauer has

been connected with the Byllesby interests for sixteen years, the last ten of which he held the position from which he just resigned.

Obituary

R. J. Morrisson

R. J. Morrisson, general manager of the Poughkeepsie & Wappingers Falls Railway, Poughkeepsie, N. Y., died on Oct. 29. Mr. Morrisson had been playing golf that afternoon with **Charles Brooks**, his predecessor as manager of the property, and left Mr. Brooks to prepare for dinner at Mr. Brooks' residence. When he did not appear Mr. Brooks made inquiries which led to the discovery of Mr. Morrisson's body in the bathroom of his apartment, where it was later established he had been accidentally overcome by carbon monoxide gas.

Mr. Morrisson has been in the public utility business since 1914. At the age of 17 he was secretary to **Charles S. Banghart** when Mr. Banghart was vice-president and manager of the Binghamton Railway, Binghamton, N. Y. This position he held until May, 1917, when he enlisted in the Eleventh Engineers. He went to France in July, 1917, with that organization. He was there for a period of twenty-two months. After his return from France Mr. Morrisson went to Augusta, Ga., as assistant manager of the Augusta-Aiken Railway & Electric Corporation under Mr. Banghart. This position he held until the fall of 1920. He was then promoted to private secretary to **James H. Pardee**, president of the J. G. White Management Corporation. This position he held until October, 1922, when he was made manager of the Poughkeepsie & Wappingers Falls Railway. Although Mr. Morrisson was a very young man his work indicated that a career lay ahead of him that would have reflected great credit upon him personally and probably would have been a source of pride to the industry itself.

George H. Moseman, for the past twenty-five years New England sales agent for the Weston Electrical Instrument Company, Newark, N. J., with headquarters at Boston, died suddenly Oct. 28 at his home in Brighton. Mr. Moseman was born at Bridgeport, Conn., about seventy years ago.

Harry R. Rochester, Western sales manager of Hale-Kilburn Company, died on Oct. 28, at Atlantic City, after an illness of several weeks. Mr. Rochester was born in Ontario on April 10, 1872. He had been with Hale-Kilburn, with offices in Chicago, since 1912. Funeral services were held in Dayton on Oct. 31.

Charles A. Merrill, in the employ of the Brooklyn-Manhattan Transit Company for twenty-two years, died recently at the age of seventy-one. In 1901 he started serving the Brooklyn company as a conductor. In 1906 he

was made a dispatcher. He was night dispatcher at the Franklin Avenue depot at the time of his death.

Lewis Otto Hayes, assistant superintendent of the subway division of the Interborough Rapid Transit Company, New York, N. Y., died recently. He had held the position of assistant superintendent since Jan. 15, 1921. His first railway work was with the Chicago Elevated Railway as train clerk. In 1904 he entered the service of the Interborough Rapid Transit Company as trainmaster on the subway division, holding this position until 1921, when he became assistant superintendent, which position he held at the time of his death. Mr. Hayes was born in Edinburg, Ind., on Dec. 16, 1875.

R. L. Woeber, who crossed the plains in an ox cart and arrived in Denver in 1867, is dead. Mr. Woeber saw the need for better transportation and with his brother organized the Woeber Brothers Carriage Company, one of the first businesses of its kind in the West. The name was later changed to the Woeber Car & Manufacturing Company. Practically every car that traverses the streets of Denver today is marked: "Made by Woeber Car & Manufacturing Company." Mr. Woeber had been sick since last February, when he suffered a paralytic stroke. He was eighty-six years of age.

M. E. Stark, general supervisor of tracks of the Connecticut Company, died recently while on a vacation at Niagara Falls, N. Y. Mr. Stark had been in the employ of the company about twenty-three years. He was born at Silver Creek, Mich., in 1856. He started on railroad work in 1882 at Kennebunkport, Me. In 1885 he went to work for the New York Central at Oswego, N. Y. From Oswego he went to Hudson, N. Y., and entered the employ of the Connecticut Railway & Light Company at Waterbury in 1900. In 1902 Mr. Stark was transferred to Bridgeport as superintendent of tracks of that division, in which capacity he served until Aug. 1, 1923, when he was appointed general supervisor of tracks of the entire system of 802 miles.

Fred J. Green, pioneer Ohio electric railway man, died in Springfield Oct. 4. Mr. Green was born at Stevens Point, Wis., in 1861 and went to Ohio about twenty-five years ago. Former Governor **Asa Bushnell** of Springfield helped Mr. Green in financing and building the old Dayton, Springfield & Urbana line, now a part of the Indiana, Columbus & Eastern Traction Company. Later they built the Columbus-Springfield line, which eventually was sold to the Indiana, Columbus & Eastern. Then came the construction of the Springfield, Troy & Piqua Traction Company, of which Mr. Green remained president until the sale of the road about three years ago and its subsequent junking by the Schoenthal Company of Columbus. Mr. Green was a member of several fraternal orders which participated in the funeral services held Oct. 6 in Springfield.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions
A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

\$1,250,000 Transmission Line from Keokuk

An electric, double-circuit, steel-tower transmission line, carrying 66,000 volts, will be built from the big power dam at Keokuk, Iowa, to Galesburg, Ill., by the Illinois Power & Light Corporation, which controls the city and interurban lines formerly included in the Illinois Traction system. The improvement will cost \$1,250,000. Work will begin at once under the direction of the engineering department of the Illinois Power & Light Corporation. The engineers expect to have the line finished within a year.

An extension of the line, carrying 33,000 volts, will also be built from Galesburg to Galva, a distance of 23 miles. The entire length of the new line development will be approximately 96 miles.

The new line starts at the dam, owned by the Mississippi River Power Company, Keokuk, Iowa. It will run up the Iowa side of the Mississippi River to Fort Madison, cross the river at this point and then extend in a northeasterly direction to Galesburg, following generally the main line of the Santa Fé Railway.

The Galesburg power plant of the company is now up to its full capacity of 4,500 kw. The new line will be capable of furnishing Galesburg electric users with a capacity of 10,000 kw., sufficient, it is believed, for the next ten years.

The Galesburg and Galva power houses will be kept intact as standby plants for use in times of emergency.

Prices Becoming Stabilized; Manufacturing Active

Market conditions at the present time show a tendency in the direction of more stable prices. The decline which occurred during the early part of the year has apparently ended and there has been a moderate upward movement. However, the earlier tendency was not without its advantages, in that it has produced a more sound price structure today than existed six months ago. It is thought that there is little or no chance of returning to the price level of 1913, and those familiar with economic conditions incline to the belief that the present stabilized price level will continue for some time to come.

Pig iron and copper continue to be weak spots in the metal market. The price of pig iron has declined considerably since last spring and there is no reason to expect improvement in the immediate future. This is not surprising, perhaps, in view of the very high level to which the price of pig iron rose

last summer. In spite of the decline, its present price bears about the normal relation to the pre-war price.

Movements in copper prices have had a general downward tendency. Lately, however, the domestic demand has been a little larger. Hope is expressed that with users coming again into the market after holding back for some time, prices may go up. Export prices have risen a little, but no great change in this situation can well be expected until European conditions improve and the copper export trade regains something of its former volume.

Manufacturing activity continues at a healthy rate. Stocks are normal in most lines, and future demands are likely to be for immediate consumption rather than for the upbuilding of reserve stocks. The prevalence of hand-to-mouth buying has produced a situation which appears superficially unsatisfactory. Under the circumstances, however, the volume of forward orders can hardly be taken as a safe guide to market conditions. The consumption of raw materials and the production of finished goods indicate that the present situation is fundamentally sound. The fact that there is relatively little unemployment at present, although the seasonal peak of labor requirements for construction and agriculture has now

past, is another indication of a healthy condition of industry.

One important steel company is operating at nearly 90 per cent of capacity, and the rate of operation for the steel industry as a whole is approximately 85 per cent. The United States Steel Corporation has increased its current dividend one-quarter of 1 per cent, or from the established rate of 1½ per cent to 1¾ per cent, quarterly.

Creditors Vote to Extend Payment of Outstanding Accounts

At a special meeting of the creditors of the Missouri Car Company in the Columbia Building, St. Louis, on Oct. 26 a motion was carried to extend half the outstanding accounts until Jan. 1, 1924, and the other half until March 1, 1924. Notes will be made out for the amounts due to the creditors, to whom they will be sent in exchange for the old notes. The plant of the company is covered by a blanket mortgage having precedence over other claims. Creditors are to be taxed 4 per cent of their claims in order to assist Orrin Merry, president of the company, in his program for rehabilitating the company. A committee of three creditors, appointed on Aug. 6, is now working with Mr. Merry in the interest of all the creditors.

Westinghouse Official Decorated.—Guy E. Tripp, chairman of the Westinghouse Electric Company, who is in the Far East in connection with reconstruction work in Japanese cities destroyed by the earthquake, has been decorated by the Japanese government.

ELECTRIC RAILWAY MATERIAL PRICES—OCT. 30, 1923

Metals—New York

Copper, electrolytic, cents per lb.	12.52
Lead, cents per lb.	6.45
Nickel, cents per lb.	29.50
Zinc, cents per lb.	7.00
Tin Straits, cents per lb.	41.50
Aluminum, 98 to 99 per cent, cents per lb.	25.20
Babbitt metal, warehouse, cents per lb.	
Fair grade	52.00
Commercial	25.00

Bituminous Coal

Smokeless mine run, f.o.b. vessel, Hampton Roads	\$4.425
Somerset mine run, Boston	2.50
Pittsburgh mine run, Pittsburgh	1.925
Franklin, Ill., screenings, Chicago	1.45
Central, Ill., screenings, Chicago	1.05
Kansas screenings, Kansas City	2.25

Track Materials—Pittsburgh

Standard Bessemer steel rails, gross ton	\$43.00
Standard open hearth rails, gross ton	43.00
Railroad spikes, drive, Pittsburgh base, cents per lb.	3.15
Tie plates (flat type), cents per lb.	2.575
Angle bars, cents per lb.	2.75
Rail bolts and nuts, Pittsburgh base, cents, lb.	4.125
Steel bars, cents per lb.	2.40
Ties, white oak, Chicago, 6 in. x 8 in. x 8 ft.	\$1.30

Hardware—Pittsburgh

Wire nails, base per keg	3.00
Sheet iron (28 gage), cents per lb.	3.75
Sheet iron, galvanized (28 gage), cents per lb.	5.00
Galvanized barbed wire, cents per lb.	3.80
Galvanized wire, ordinary, cents per lb.	3.35

Waste—New York

Waste, wool, cents per lb.	13-17
Waste, cotton (100 lb. bale), cents per lb.	
White	12-14.50
Colored	9-14

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), per gal.	\$0.95
White lead (100 lb. keg), cents per lb.	11.375
Turpentine (bbl. lots), per gal.	\$0.98
Car window glass, (single strength), first three brackets, A quality, discount*	84.0%
Car window glass, (single strength), first three brackets, B quality, discount*	86.0%
Car window glass, (double strength) all sizes, A quality, discount*	85.0%
Putty, 100 lb. tins, cents per lb.	4-6

*These prices are f.o.b. works, boxing charges extra.

Wire—New York

Copper wire base, cents per lb.	14.625
Rubber-covered wire, No. 14, per 1,000 ft.	\$6.60
Weatherproof wire base, cents per lb.	18.00

Paving Materials

Paving stone, granite, 4x8x4, f.o.b. Chicago, dressed, per sq. yd.	\$3.60
Common, per sq. yd.	3.20
Wood block paving 3½, 16 treatment, N. Y., per sq. yd.	2.79
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots	54.00
Crushed stone, ½-in., carload lots, N. Y., per cu. yd.	1.75
Cement, Chicago consumers net prices, without bags	2.20
Gravel, ½-in., cu. yd., f. o. b. N. Y.	1.75
Sand, cu. yd., N. Y.	1.25

Old Metals—New York and Chicago

Heavy copper, cents per lb.	9.75
Light copper, cents per lb.	8.75
Heavy brass, cents per lb.	5.25
Zinc, old scrap, cents per lb.	4.125
Yellow brass, cents per lb. (heavy)	5.75
Lead, heavy, cents per lb.	5.50
Steel car axles, Chicago, net ton	\$15.25
Old car wheels, Chicago, gross ton	17.75
Rails (short), Chicago, gross ton	19.75
Rails, (relaying), Chicago, gross ton	33.50
Machine turnings, Chicago, net ton	6.75

Rolling Stock

Nic Le Grand, Inc., is installing safety devices on one-man cars of the Saginaw Transit Company.

Eastern Wisconsin Electric Company, Sheboygan, Wis., has placed an order with the St. Louis Car Company for four new Birney safety single-truck cars equipped with the latest safety appliances. Delivery is expected before Jan. 1. The new equipment is planned to give better and speedier service in Sheboygan.

Los Angeles Railway will construct twenty more cars in the main shops at Fifty-fourth Street and South Park Avenue, according to an order of General Manager Kuhrt in the 1924 program of company work. The twenty cars will be similar to the fifty-five cars that are being built in the 1923 program. They will be four-motor cars and equipped for single unit or train operation.

Track and Line

Philadelphia Rapid Transit Company has placed on order with the Lorain Steel Company for 4,000 tons of light rails.

New Jersey & Pennsylvania Traction Company, Trenton, N. J., will lay new rails on West Hanover Street, Trenton, between Willow Street and Green's Place.

Chicago & Joliet Electric Railway, Joliet, Ill., is engaged in eliminating a large grade crossing. The trolley track will pass over both the state highway and a steam railroad.

Hattiesburg Traction Company, Hattiesburg, Miss., is overhauling Hardy Street. The roadbed has been graded, new cross ties placed and the right of way cleaned.

Altoona & Logan Valley Electric Railway, Altoona, Pa., is lengthening all switches for passing purposes between Altoona and Tipton. This is because of the greater traffic that is expected through the opening of a motor speedway at Tipton.

City Railway, Dayton, Ohio, has asked the City Commission for permission to extend its lines several squares beyond the present loop. The company desires to extend the Third Street line from its present terminus at the Dayton and Eaton pike.

Mobile Light & Railroad, Mobile, Ala., will be requested to extend its line down Government Street or nearer to the Louisville & Nashville depot so that persons leaving and arriving by train may have better service and also so that women and children will have protection while traveling.

Chattanooga, Tenn.—The public utilities in Chattanooga, exclusive of the railroads, are spending approximately \$952,000 on improvements and additions during the current year. The

largest expenditure is by the Tennessee Electric Power Company, which is estimated at \$582,000.

Los Angeles Railway started construction of the track on Evergreen Avenue between First Street and Brooklyn, at the Brooklyn Avenue end. This will give a cross-town service for Hollenbeck Heights. The company is also extending its Vermont Avenue line from First to Monroe Street.

Washington Railway & Electric Company has completed physical improvements on its Columbia, or H Street, line at a cost of \$361,653, which includes new and heavier rails, a concrete roadbed, new switches and new third rail. The new track extends from Fifteenth and H Streets Northeast to Twelfth Street and New York Avenue Northwest. Heavy rails of especial design were used to carry the trains of the Washington, Baltimore & Annapolis interurban, which reaches its Washington terminal over this route.

Monongahela-West Penn Public Service Company will repair its tracks on Eighth Street from Juliana to Ann Streets in Parkersburg. The present tracks will be replaced with new ones and will probably be laid in a concrete base. A 9-ft. right of way for the tracks extending over the block from Juliana to Ann on Eighth Street has been arranged. The tracks have been in bad condition for some time and arrangements have been made to repair them, but several difficulties were encountered which delayed starting the work.

Power Houses, Shops and Buildings

Empire State Railroad Corporation, Syracuse, N. Y., has awarded a contract for a new station at Minetto and the Public Service Commission has dismissed complaint by residents of Minetto asking for the station facilities.

Public Service Railway, Newark, has informed the City Commission of Trenton that it is now seeking a new site on which to erect a modern terminal for the cars of the Newark-Elizabeth and Camden divisions. Some time ago the company endeavored to secure the old Trenton Bank in the heart of Trenton, but this was taken over for other purposes.

Trade Notes

E. I. Du Pont de Nemours & Company, Fabrikoid Division, Newburgh, N. Y., has appointed Ross F. Hayes, 2 Rector Street, New York City, as Eastern sales agent, railway department, for sale of its Fabrikoid products. Mr. Hayes' territory includes New England, southern and middle Atlantic States.

Traffic Signal Corporation of New York City has filed an amended certificate in the office of the Secretary of State at Albany increasing its capital stock from 500 shares, of which 400 are

preferred \$100 par value and 100 common non-par value, to 600 shares, of which 200 are preferred \$100 par value and 400 shares common no-par value.

F. C. Richmond Machinery Company, representative for the Conveyors Corporation of America, Chicago, has moved its offices and salesrooms to 320 West Second South Street, Salt Lake City. The F. C. Richmond Machinery Company is one of the largest mill supply houses in the West.

Eccles & Smith Company has sold out and is retiring from business both in San Francisco and Los Angeles. Its machine tool business was sold to the Waterhouse & Lester Company and the railway supply business is being taken over by Robert W. Jamison, 637 Mission Street, San Francisco, and C. Eccles in Los Angeles.

The Society for Electrical Development through its directors has authorized the establishment of an office at 527 Rialto Building, San Francisco, in order to render a more personal and intimate service to the electrical industry of the Pacific Coast. Samuel H. Taylor, formerly president, Electric Railway & Manufacturers Supply Company of San Francisco, has been appointed Pacific Coast manager. Mr. Taylor will continue to serve as secretary of the Pacific Coast Electrical Association.

New Advertising Literature

Conveyors Corporation of America, Chicago, Ill., has issued a folder entitled "American Air-Tight Doors."

Wagner Electric Corporation, St. Louis, Mo., has issued Bulletin 134 entitled the Fynn-Weichsel Motor.

Crouse-Hinds Company, Syracuse, N. Y., has issued folder No. 7 entitled "Flanged Obround Condulets." The folder contains a full page spread of the obround condulets, covers and wiring devices.

Reo Motor Car Company, Lansing, Mich., has issued a thirty-five-page book on passenger buses on the speed wagon chassis. The company has also issued in pamphlet form a report of a special investigation on the installation of the Richmond Rapid Transit Company, the Detroit City Motor Transportation Company, the Owosso-Flint Bus Line, Inc., the Mason-Lansing Bus Line and Cain Brothers interurban line.

Pioneer High-Speed Machine Knife & Tool Company, Cleveland, has issued a pamphlet announcing the establishment of a new company of craftsmen concentrating on the production of cutting tools of improved quality and marked economy. The company is headed by A. W. Ericson, who has specialized in the manufacture of sheer blades and knives for thirty-one years. The organization is called Pioneer High Speed Machine Knife & Tool Company "because of the years invested in attaining the requisite experience and skill."

HENRY W. BLAKE and HARRY L. BROWN, Editors

A Basis for Getting the Merchants to Accept Traffic Regulation

WE ARE all familiar with the phenomenon of a small commercial district springing up almost overnight where only residences used to be. At first thought this may be considered an inevitable accompaniment of the growth of the community. This is partly true, but the neighborhood store is growing at a very much faster rate than the population. Even in cities of moderate size it is now possible to purchase nearly all the necessities of life and most of the luxuries, including high-class entertainment, without going more than a few blocks from one's own home.

The greatest losers by this development are the downtown merchants. But another loser is the electric railway, which is deprived of two fares every time a customer buys at the neighborhood store instead of riding downtown and back. The trolley company and these merchants thus have a common interest in centralized trading.

A contributing reason for this development has been the slowing up of surface transportation systems. The longer it takes to reach the center of the city and return again, the more people get away from the habit of shopping downtown. The modern electric car is faster than its predecessors, but it is being seriously handicapped because of vehicular congestion.

We have been deluged with figures concerning the number of automobiles in this country, totaling some 14,000,000, or about one to every seven inhabitants, and many people have come to believe that the population in its daily comings and goings uses the automobile to the almost entire exclusion of all other means of transportation. This idea has led merchants to make tremendous efforts to attract the automobile trade. But the falsity of this theory can be very easily demonstrated. For example, the recent traffic survey of Los Angeles showed that on one street during a single hour there were more than 14,000 passengers in street cars and only 1,169 riders in automobiles. It is ridiculous to assume that there is more potential purchasing power in 1,100 automobilists than there is in 14,000 trolley riders. The truth is that few merchants could survive on the automobile trade alone. Their prosperity depends upon the proper functioning of the whole transportation system.

This idea is not new to the electric railways, but it is just beginning to be appreciated by the merchants. They have thought that cars parked around their stores meant increased trade. This was true once, but the limit was soon reached. Now only part of those who would shop can find places to park near the store, and the general congestion resulting, added to the other

street traffic, tends to close off the easy access to the shops for the multitudes who ride the street cars. And it is in reality these car riders who support the stores, not the automobile owners. Thus, whatever makes it easier and quicker for the street car rider to get to the downtown store is of material interest to the merchant, and if appealed to on this basis, the latter would probably want to support, rather than oppose, as he has often done, the anti-parking and other traffic regulations that would help to speed up street car operation.

Objections to One-Man Cars Are Largely Political in Character

IT IS hard to see the philosophy of demanding the withdrawal of one-man cars, as has been proposed in various cities and states. The most recent cases are those of the state of Massachusetts and the city of Oakland, Cal. The objection to the use of cars of this type seems to come mainly from certain politicians, who use this as a means of keeping an issue before the public in order to line up prospective votes.

The one-man car is not an experiment, and it has been used in so many different localities and under so many different conditions that it has been proved out thoroughly. The annual statistical review published by this paper in the issue for Jan. 6, 1923, showed that approximately 7,500 cars of this type were then in use, and 785 cars were remodeled for one-man service during 1922. A later study made for the annual convention number published Sept. 29, 1923, shows that out of a total of 1,385 cars ordered in the first six months of this year, 1,206, or 87 per cent of the total, were arranged for operation by one man. Surely this does not indicate that the one-man car cannot be depended on for service.

With the use of one-man cars the railways have found it possible to meet rising expenses of operation to some extent and to handle the business at costs not so much above those existing prior to the war, as would be the case without their use. This has kept fares down below what they would have been without such help. The basic fact in this connection that cannot be overlooked is that wages of today are twice as great as they were when the companies were making money on a 5-cent fare, and the account "conducting transportation," which is principally platform labor, amounts to about 50 per cent of the total operating expenses.

In Massachusetts, where a bill to abolish one-man cars has been introduced in the Legislature, it has been stated that the electric railways have operated some 56,000,000 car-miles with one-man cars, and that the accident record has been considerably improved as compared with two-man operation. This has been held

due largely to the greater responsibility felt and discharged by the individual operator.

In Oakland the San Francisco-Oakland Terminal Railways has made an investment of upward of a million dollars in cars of this type, with the approval of the City Council that now wants to prohibit them. The purchase and the operation of the cars also have the sanction of the State Railroad Commission. The company states that these cars, which were put in service in 1920, have made more than 2,000,000 miles and carried 13,700,000 passengers in safety without protest or complaint. This certainly does not give any valid argument for the present agitation in the City Council.

It is just such actions of politicians as this that lead to many of the financial difficulties of electric railways. It is not an easy matter for the management to do its best to give adequate service under adverse conditions and then have all its labor go for naught at the whim of a group of politicians. Nothing is gained by such moves, as the only persons who may benefit, the car operators, may lose their jobs entirely instead of getting additions to their ranks. As a matter of fact, the best way to make the trainmen prosperous is to make the railway prosperous, and this cannot be done by limiting the productivity of the individual.

Building Traffic— or Driving It Away

HOW MANY of us appreciate the possibility for application of the practice expressed in the much-used words "merchandising transportation"? There is some basis for feeling that the difficulties of many electric railway properties are attributable, in part at least, to a very limited conception of what may be done to sell transportation. Two instances illustrate the point.

The first happened to a man who tried the experiment of traveling from Chicago to Rochester, New York, via electric. He, with several other travelers who cover this territory frequently, were informed by one electric railway property along this route that a connection would be made with another company's car at the terminus of the first line. Coming up the main street of the town, one minute late, the party saw the outgoing car leave the terminal. Apparently no effort was being made by either company to make this very desirable connection.

Compare this example of the way in which this group of regular patrons of the line were accommodated with the details of the second case.

A passenger informed the agent at the station at which he boarded a high-grade limited train of an electric line that he was very anxious to make connection with a through steam railway train at a station some distance from the electric line's terminus in a large city. The agent and then the traffic department quickly responded to the situation. Arrangements were made to hold the steam train for this passenger. The electric train was brought into the terminal several minutes ahead of schedule. A taxicab provided by the electric line was waiting to transport the passenger to the steam road station. Tickets had been secured for him in the meantime by the electric railway traffic department. Needless to say, a delighted passenger boarded the steam train.

The details of the methods used to accomplish this connection are of no particular interest. However,

the spirit back of the organization is worthy of imitation.

The two cases cited are extreme, although they are both actual incidents. Imagine the frame of mind toward the electric railways in which these two passengers completed their respective trips and you have a striking example of what it means to merchandise electric railway transportation. If the names of the two railways concerned could be divulged, their respective condition would well illustrate the results of the spirit underlying the incidents related.

Earning Power Is Key to New York Railways Reorganization Plan

TO A reorganization committee, the value of any property lies in its earning power. Capital to build up a property may or may not have been wisely used in that process and may or may not exceed the value of the physical plant, but the net earnings after paying all charges are the usual measure taken of prosperity of an enterprise. It is this consideration probably that has led the committee in charge of the work of preparing a plan for the reorganization of the New York Railways to recommend the wiping out of \$17,495,060 of stock of that company, and a change in the remaining financial structure so as to cut fixed charges by \$720,000, annual contingent charges by \$650,000 and rentals of leased lines by \$350,000.

Peculiar circumstances surround the operation of this property. The question of the pursuit of a wise or unwise policy in connection with its operation in the past does not enter into the picture now. With escape from the fixed 5-cent fare apparently impossible, with the competition of the rapid transit lines confronting it and with other factors entering, the entire economic status of the company has changed. All these things the majority representatives of the various security holders have taken into account, and they have submitted for the approval of the court and commission a plan which would appear to make it possible for the company to carry on indefinitely without the likelihood of future disturbance of its credit. Thus the only bonds which it is proposed to leave undisturbed in the reorganization are those which have earned their interest in the past. As the *New York Times* remarked, the lines and leases, the stocks and bonds, which fail to produce dividends or interest are sentenced to capital punishment. To those who are always clamoring for regulation and more regulation, the same paper says that the punishment proposed to be meted out exceeds anything which toothless statutes could inflict. In short, they are economic regulations. The fact that a minority report was presented to the court differing in some of its points from the majority opinion does not alter the main facts, for the ends sought in both reports are essentially the same.

However hard the terms of the reorganization may appear, they could hardly in this instance be less drastic and not invite a repetition of disaster in the future. In this respect they are particularly in the interest of the public, which in the future will be represented on the board of directors under the provision to that end suggested by the committee. This provision is in line with recent thought in New York as shown by the adoption of the same plan by the Interborough Rapid Transit Company and its inclusion in the proposed "consolidation" plan of the Transit Commission.

One Hundred per Cent One-Man Operation Proves Successful in Dayton

Improved Service at a Lower Fare with Double-Truck Cars
Has Increased Traffic and Reduced Operating Expenses
in Spite of Higher Wages on the City Railway System

By H. C. DeCamp

Formerly Assistant General Manager City Railway, Dayton, Ohio

On One of the Main Streets of Dayton Passengers Are Seen Boarding the One-Man Cars at the Front Door and Leaving at the Rear Door. An Extra Man on the Street at the Front End Is Making Change

DURING the strike of the platform men of the City Railway in July, 1921, a large number of jitneys made their appearance in Dayton. On this account, after the strike was settled, it was necessary for the company to take vigorous action to regain its lost traffic. Prior to July the fare had been 7 cents or four tickets for a quarter, but it was decided after the strike to reduce the cash fare to 5 cents, with a 1-cent transfer charge.

So much money had been expended during the strike that it was necessary also to cut down the operating expense in order to put the equipment in shape and improve the service. The railway was then operating fifty-six double-truck and several single-truck two-man cars to fill the schedule. Investigation was made in numerous cities where double-truck one-man cars were in use, to determine the feasibility of applying this remedy to the situation in Dayton. This led to the conclusion that if the City Railway could attain 100 per cent one-man operation with double-truck cars the financial problem would be solved.

As a result of the study of one-man operation elsewhere, the company decided to adopt the front-entrance

rear-exit plan. There were several reasons for this, the most important being the desire to get the money first, so that in case of any delay on the line, there would be no opportunity for disputes because passengers were not carried through to their destinations. Owing to the layout of the various lines in the city, it was thought that there would be less chance for transfer abuse if transfers were issued when the passengers boarded the cars. Another reason for the adoption of the front-entrance plan was the desire to eliminate boarding accidents which might occur in case the car was crowded and the operator at the front end did not have a clear view of the rear door.

Under the plan being followed in Dayton, after the car has come to a stop, the operator looks into an inside mirror located on the right-hand window post, notes the number of passengers wishing to alight, and when the last one has got off the car, as shown by an outside mirror, he gives a second glance at the inside mirror to note if any other person may suddenly have decided to get off, and if not, closes the rear door and starts the car.

Both front and rear doors are operated by pneu-

Car Built in 1914 and Remodeled for One-Man Operation

matic door engines. These are controlled by two air valves placed in a convenient position, one above the other, at the left of the air-brake valve. By a single movement of the operator's hand both doors can be opened. On each door engine is a switch which controls red and green lights placed in a small metal box on the front center window post immediately in front of the operator. If a door is open, a red light is shown, and when closed, a green light appears.

In addition to the inside and outside mirrors, each car is equipped with a row of five electric lamps over the rear door. These are placed in the letterboard panel and are controlled by the door switch. At night when the door is opened the lamps are lighted, producing a flood of illumination around the outside steps. The lighted area extends for a distance of 15 or 20 ft. and materially assists the operator in determining when the passengers have alighted.

The double-truck one-man cars were equipped with Syracuse turnstiles at the rear end, located as shown in an accompanying illustration. At heavy loading points, in Dayton, it frequently happens that twenty or twenty-five passengers leave the car at the same time. If it were necessary for them all to leave by the front door, confusion and delay would occur, because even with a double front door, only a small number of pas-

sengers can board the car before they come into contact with outgoing passengers in the aisle. The method followed, however, has been found to eliminate this difficulty altogether. Another advantage is that passengers move toward the rear of the car, where they will alight, and the entrance is thus kept clear.

HOW CAR REQUIREMENTS WERE MET

When the City Railway commenced one-man operation, it was decided to rebuild all its cars, because they were very much in need of it, and also to purchase fifteen new light-weight cars especially designed for that method of operation. The latter have already been described in the *ELECTRIC RAILWAY JOURNAL*, issue of Oct. 28, 1922. As the company's shops were not fitted for such general rebuilding, the work was done at the shops of the Oakwood Street Railway, Dayton. A single car was first entirely rebuilt, repainted inside and out, and completely equipped as a sample of the type to be operated. This model was then approved by the City Commission, and the company began publicity work to tell the general public what it intended to do and how it expected to give better service.

At the start the model car was placed in service with two men, operating on No. 1 run on the best line in the city of Dayton. The company's object in stationing

Ten More Cars of This Type Were Put in Service Recently

two men on the car was to have the second man stand in the rear and in case any one started to alight by the front door he could call out "Rear door, please." These two men alternated in running the car, and by this means, both became expert at it. The car was operated for three days on this run and then put on No. 2 run, the crew of the latter run having been broken in during this period. In this way, all of the crews

The percentage in saving of platform wages for the first eight months of this year, compared with the corresponding months of 1922, was as follows: January, 36.4 per cent; February, 36 per cent; March, 37.2 per cent; April, 39.8 per cent; May, 37.7 per cent; June (increased wages), 33 per cent; July, 33.8 per cent; August (extra time for change men in the rush hour), 29.6 per cent.

All the expenses of re-

The Removal of the Turnstiles Installed at Rear, as Shown Above, Has Been Made

Interior of Older Type Car Rebuilt for One-Man Operation

on runs from 1 to 12, on that line, were instructed in the new operation of cars. At the same time, the public became quite familiar with it. On Sunday, July 23, 1922, when travel was light, a complete equipment of new cars was installed on one line. The same method was followed to inaugurate one-man service on the other lines in the city. At the present time, the company is operating 100 per cent one-man service with double-truck cars.

SAVING IN PLATFORM EXPENSE

The wage scale in effect after the strike beginning in July, 1921, was 41 cents per hour for the first three months, 43 cents per hour for the ensuing nine months, and 45 cents after the end of the first year. This was later increased to 46, 48 and 50 cents per hour respectively, when one-man operation began. In June of the present year, the company voluntarily increased wages to 51, 53 and 55 cents per hour for the one-man operators.

constructing the old cars, as well as the purchase of new cars, have been paid for by the saving in wages and operating expenses and by the increased traffic resulting from improved service. The number of revenue passengers has increased to a gratifying extent. This trend is illustrated in the accompanying chart. The City Railway believes that its success in this venture has been due not only to the front-entrance and rear-exit plan adopted, but also to the thorough education of the public, the careful training of the operators, and attention to small details of equipment. The riding public is well satisfied with the service, and the operators would prefer to resign their jobs rather than return to two-man operation.

No better proof of the success of one-man operation in Dayton is possible than an examination of the financial results therefrom. Besides paying for the reconstruction of the old cars, as already stated, and the purchase of new cars, the railway has paid 6 per cent on the preferred stock and 3 per cent on the common stock.

When all service was performed by the two-man cars, the company had 240 platform men. At the present time, with 100 per cent one-man service, the number is 126, which includes six flagmen for railway crossings. At the time of the change, all regular runs were replaced by one-man cars on a car-for-car basis, with the same number of swing runs, but extra trippers added for the evening rush hour. This was done to give the better service which the company promised when making the change. Inasmuch as the change was made gradually, no actual release of employees from service was required, but the company simply ceased to employ new men as employees turned in their resignations. This method worked out to the mutual satisfaction of the railway and the platform men.

SOME OPERATING DETAILS

With two-man operation the average schedule speed of the lines of the City Railway was $9\frac{1}{2}$ m.p.h. Since the inauguration of one-man operation, no change has been made in this schedule. In fact, one of the problems has been to keep the operators from running ahead of time. Since he is in sole charge of the car, the operator does not now have to wait for a signal from the conductor, and this saving in time has resulted in an actual increase in speed, rather than in a tendency to slow up operation.

In the matter of making change, the 5-cent fare has been a great advantage. During the rush hour, from 4:30 to 6 p.m., changemakers are stationed at the principal loading points. By making correct change for passengers before they board the car, they have speeded up operation to such an extent that actual records show a loading speed of thirty-five passengers per minute.

The issuance of transfers has been another problem. A machine is now being developed in Dayton, which is inexpensive and it is hoped will prove satisfactory. Experiments are being tried with it on the Oakwood Street Railway.

Ordinarily, all switches are controlled from inside the car, by using a switch iron through a hole in the floor. During the evening rush hour, however, switchmen are stationed at important points to throw the switches. They also serve as changemakers at these locations, and thus are an additional help to speedy operation.

When one-man service was first inaugurated all of the cars were equipped as noted previously, with Syracuse-type turnstiles at the rear doors. The public has now become educated to the method of operation, and the turnstiles are no longer considered necessary and are being removed from all of the cars. By taking them out, passenger interchange is accelerated, and at the same time valuable space inside of the car is regained. The removal was made also on the ground of public relations, and since their removal, the approval of the passengers has been clearly expressed.

COST OF NEW AND REBUILT CARS

The rebuilt cars are of three general types, those designated as Barney & Smith cars with a narrow platform, a wooden type built by the Cincinnati Car Company in 1909, and some modern steel cars. Five out of twenty of the latter type have been rebuilt at a cost of \$2,000 each for the body, outside of trucks and electrical equipment, and the weight reduced 4,500 lb. by changing the type of motors and trucks. The wooden cars were rebuilt outside at a cost of \$4,825 each, which includes an overhead charge of 100 per cent. The cost of converting the older Barney & Smith cars varied somewhat in price,

on account of the installation of electric heat in four of them. The price of the new light-weight cars was \$9,971 each.

In all of the cars there has been installed, for emergency, a conductor's air valve in the front vestibule, operated by a red cord running along the molding. This cord has pull-handles at the front, middle and rear of the car, labeled "For Emergency Only." When the cord is pulled, exhaust air actuates a circuit breaker knock-out, which shuts off the current, applies the brakes and balances the door engines in the same manner as in the standard safety car.

Ten new steel light-weight cars of the type shown in an accompanying illustration were put in service during September of this year. The use of all single-truck cars has now been discontinued, and fifty of them were burned a short time ago, after all available material had been salvaged. Enough plate glass was secured to equip all of the new cars, and in addition there remained a plentiful supply for future replacements.

During the past year the company has been operating with an insufficient number of cars to provide adequate service. Passengers have been crowded in to such an extent that it has been difficult to close the doors. While the undesirable features of such an arrangement are freely admitted by the railway, nevertheless this has served as an excellent test of the value of one-man cars in heavy traffic. Although the population of Dayton is only 160,000 and there are five separate railways operating within the city, nevertheless the City Railway carries an average of 60,000 passengers on week days, and on Saturdays from 75,000 to 80,000.

The public has been pleased with the one-man operation; the platform men are thoroughly satisfied with it, and the number of accidents has decreased. The financial results have been so good that the old rolling stock has now been entirely rebuilt or replaced by new cars. It is therefore felt by the company that the success of the experiment begun a little more than a year ago has now been thoroughly established.

New Safety Organization on Beaver Valley Traction

EX-MEMBERS of the safety committee of the Beaver Valley Traction Company, New Brighton, Pa., determined to keep in touch with the safety work that is being carried on, have formed a new organization known as the "Veterans' Association" of the safety committee, which is sponsored by H. O. Allison, safety engineer.

The safety committee is elected by a vote of all the employees. Membership in the Veterans' Association is limited to those who have served at least one full term on the committee. If any member is re-elected to the safety committee he automatically loses his membership in the Veterans' Association. The purpose of the new organization, of which W. F. Allshouse, track foreman, is president, is to carry on the safety work, and functions as the "Senate of Safety" for the road. Thus has it been exemplified that interested employees who possess initiative will respond when there is a real need for their work. That the safety work pays is attested to by the following statement issued by W. H. Boyce, general manager:

"Organized safety work has resulted in the reduction of our accident costs from 8 per cent of the gross, which was the average for a ten-year period, to 2.42 per cent of gross in 1920, and 1.89 per cent in 1921."

Using the Streets for the Greatest Good of the Greatest Number*

By J. Rowland Bibbins

Consulting Engineer, Washington, D. C.

Traffic Conditions in Several Cities Are Cited as Typical of the General Problem.—The Subject of Expediting Traffic Movement Is Looked at in a Broad Way, from Which It Is Noted that However Important Are Other Phases of City Planning, Transportation Must Be Considered as a Fundamental

IT SEEMS high time for those concerned in the serious study of city and transportation development to make a new appraisal of present conditions and future possibilities, for the conflict of interest of those using the public streets has become a veritable battle for supremacy. "Traffic" has become a regional as well as a local problem, and future growth must be met more frankly and scientifically than in the past.

ELEMENTS OF THE PROBLEM

In general, the elements of the problem are as follows:

1. Transit service—capacity and routing.
2. Street traffic control—vehicle and pedestrian.
3. Rail and marine traffic—provision for special needs.
4. Street and highway plan—capacity for present and future.
5. Pedestrian movement.
6. Relation to the broad city or district plan and the general public welfare; special needs of the office, wholesale, retail, warehouse and industrial districts; also the purchasing power of the city for public improvements as measured by its increasing revenues from taxation of private property.

SOME TYPICAL CONDITIONS

Chicago has attempted literally to serve an area of over 200 square miles by a central district eight blocks wide by twelve blocks long. But business has now burst through these fictitious boundaries, after facing an economic loss estimated by the City Plan Commission at \$60,000,000 a year from traffic impedance due alone to parking in a lineal street frontage of only 110,000 ft. A thirty-minute day and no-parking rush hour traffic ordinance has improved conditions, but 300,000 cars in the Chicago district call for accommodations upon the public streets for business and pleasure.

Baltimore recently found in its business district 152,339 vehicle movements and only 21,036 street car movements, and that during the rush these vehicles handled only 11 per cent of the total passengers carried, while the street cars handled 89 per cent.

Detroit has developed a northerly sub-center of unusual size, Highland Park, but here, at the principal exit from the Ford Motor Works, a rush-hour traffic is found averaging eighteen seconds headway per street car, two seconds for vehicles, and from 0.1 to 0.2 second for pedestrians; i.e., about 200 street cars, 1,800 motors and 10,000 to 20,000 pedestrians per hour.

Montreal, at its three most important street cross-

ings, finds 75 per cent more vehicles than street cars, but these carry only 7 per cent of the passengers carried by cars. And during heavy winter snowfall, practically all traffic is confined to the car tracks for long periods. Motors have multiplied five times in six years and trucks nearly doubled in two years. There are only three main highway entrances to the city, one from the south; but over 80,000 United States automobiles enter Quebec Province during the summer, mostly reaching Montreal. Yet Montreal has only one main traffic street with roadway as wide as 54 ft., necessary for free two-way traffic with street cars and parking, and this street is used for heavy freight traffic between east and west side railroads and industrial districts as well as for the street railway terminal trunk lines.

Los Angeles is striving to work out of its tangle of motor traffic, superimposed upon its street railway and heavy interurban train movement through the streets. It has been recently proposed seriously to exclude street cars entirely from the central business district, using a belt-line transfer instead.

A large proportion of the through interchange l.c.l. freight movement between Chicago railroad terminals is still handled through the city streets by trucks. In Cincinnati practically all l.c.l. interchange freight, formerly handled by trap cars, is now motored through the streets by the shortest route.

These are not far from typical conditions throughout the country in the larger cities. The two most serious tendencies have been the general resistance to any change or betterment except at the "other fellow's" expense, and the very general recourse of city authorities to sudden and drastic prohibition in one form or another in the use of the public streets.

GROWTH AND THE FUTURE

It is probable that by 1940 our population will approximate 130,000,000 people, of whom 70,000,000 or more will reside in the cities. Railroad freight tonnage is increasing proportionately as the cube of the population or nearly so; ton mileage is increasing much faster. Thus, terminal tonnage is a problem proportionate to the cube of urban population, at least for a time. Trucking tonnage will probably increase as fast; for, except that which moves car-load direct from origin to final destination, the entire rail tonnage must be carried over our streets and highways one or more times, according to the number of fabrications.

The paradox of transit traffic increasing as the square of the population still continues in New York City, and in most cities it is at least following a geometric

*Reprinted from the *American City Magazine*.

progression, rather than straight proportion. Motors are increasing far beyond the fourth power of the population, and it is found in some cases that the total movement each day in and out of the delivery district of a large city is equal to, or greater than, the number of car registrations for the entire city. Pedestrian traffic seems to be hopelessly crowded into the back-ground.

On the other hand, fixed traffic facilities, such as streets, tracks and terminals, are only slowly increasing—hardly as fast as the population, if at all—while the traffic itself is increasing in geometric ratio to the population. Meanwhile, city authorities hesitate to undergo apparently expensive improvements, although clearly running the risk of vastly greater expense later, due to the rise in property values. And here is the one fortunate aspect. For the assessed value of property in our cities is increasing at about 1.7 power of the population, in some cases faster than the square. This growth is generally stable and a reasonably sure index, and should offer great encouragement to careful study and prompt action.

SUGGESTIONS FOR CONSTRUCTIVE ACTION

From these facts it is clear that the immediate and future problem is largely a terminal one. It has been greatly neglected in the past and left entirely in private or corporate hands or to the carriers themselves. Few cities have even gone so far as to develop bypass traffic streets and highways,* and in a recent 2,000-mile auto trip in the East the writer did not see a single sign at the entrance to a city reading "Heavy traffic detour this way."

There are many avenues for constructive action, immediate and future, which ought to be based upon ascertainment of definite facts first. The general idea of decentralization is of course good, but even sub-centers have to be planned in advance. Thus, the problem of Highland Park, Mich., is already as large as the central district problem of a city of a million or more.

The thoroughfare plan is most important. We now know that the old decimal system of 40, 50, 60, 80 ft. widths has little merit as a measure of real traffic capacity. Sidewalks and obstructions must give way and arcading of highly developed narrow streets may often have to be resorted to, to widen the roadway and still give opportunity for full development of air rights above. The constant extension of building heights is a ruinous civic policy. Some office buildings are now being built with automobile storage for their tenants in the basement.

The "twilight zone" surrounding the business districts of all large old cities offers an unusual opportunity for development of marginal long-time storage facilities for business cars; and in cities of rugged topography, hillside garages with entrances from two or three levels can be built and operated at far less cost than the ramped buildings now being built. Limited parking must be adopted, but rigid prohibition is obviously the wrong method, at least until our citizens become rich enough to have their own chauffeurs. In every city many idle spaces can be developed, at least temporarily, for pay storage at moderate rates; and underground storage in large public areas, such as the

ideal situation in Grant Park, Chicago, remains to be developed.

With a reasonable accommodation of essential motor traffic, it will be found that the problem of street car movement will unravel itself through better operation, now almost impossible, and rapid transit. Singularly enough, the value of prepayment loading stations for street cars at large industries and other heavy transit points, for speeding up the line, has been too often neglected by both transit companies and industries. Electric railways still exist as our major hope of mass transportation, but they cannot function unless given the right of way which is proper under our democratic code of life—the greatest good of the greatest number. The fuller development of strategic railroad entrances, available in many of our large cities for combination railroad, rapid transit and motor ways, is a public resource of immense value to which immediate thought should be given; for this policy will save tremendous investment in otherwise duplicated facilities, or, conversely, provide more facilities for the same money.

Perhaps the greatest immediate need of the railroads is to apply a "suction pump" to their terminals to get the freight away. In other words, off-rail movement is perhaps equal in importance to overland movement. In the aggregate, half of the total transport cost, origin to destination, is off-rail. The efficient organization of this great off-rail movement in our cities is a problem that has been almost wholly lost sight of, except in a very few cases.

To this end there must be brought about some reasonable form of general terminal unification—at least in operation, if not in ownership and control. Probably half of the investment in railroads today is in other than main-line track, namely, terminals, and the proportion of new capital therein is increasing and necessarily must continue to do so. Coupled with a real organization of off-rail motor movement, terminal unification offers perhaps the greatest opportunity of the future for increasing the efficiency and revenue-earning capacity of railroad investment. And in the face of the present astonishing growth of rail tonnage, some such plan may soon become imperative. Zoning of commercial districts, including terminal, port and harbor operations, has also become a definite need.

The reclamation of land values, especially in railroad terminals, surrounded as they are by highly developed areas, again offers future possibilities difficult to exaggerate, and one of the most important financial resources now available to the railroads. It is almost axiomatic that rise in land values must eventually force a recession of freight facilities (and possibly passenger facilities) through the agency of motors, just as in other normal real estate development. Store-door delivery will simply accelerate this rational process.

In these necessary great public improvements of the future, part solutions are dangerous, as the various factors are so inter-related. In rational terminal evolution (used in the broader sense), rail, motor, trolley, barge and ship must each play their logical part. If a reasonable system, similar to our present local district assessment method, is worked out on a basis of true cost and benefit, with excess condemnation where it is obviously essential to insure correct development, the future growth of our cities will not prove so distressing a problem as in the past. However important other phases of city planning, transportation must be recognized as having a more definite place in the general perspective. It is not a detail; it is fundamental.

*But Baltimore has developed its "Falls Way"; Chicago, 65 miles of freight tunnel and its two-level Michigan Boulevard (South Water Street Extension underway); New Orleans, its Belt Railroad; St. Louis, its plan for motor freight to off-track inland stations.

Shunt Operation of Rotary Converters in Substations Effective

By R. J. Saulsbury

Chief Electrician Pittsburgh Railways

Pittsburgh Railways System Adopted Shunt Operation for 60-Cycle Converters Early in 1923—Time of Power Outages During First Six Months of This Year Reduced to Less than Half that Occurring with Compound Operation Last Year—Flashovers Almost Eliminated

AS THE older direct-current power stations and motor-generator substation sets supplying the Pittsburgh Railways were replaced with modern 60-cycle rotary converters, it began to be noticed that the power supply was not as reliable as formerly. Outages became more frequent and flashovers were increased. Since the substations were tied in to a large alternating-current distributing circuit instead of being operated separately, these disturbances frequently affected large sections of the power system, rather than being purely local as in the past. After researches made under the direction of the chief electrician, it was decided to adopt shunt operation of all the rotary converter stations. The result was that difficulties of this sort were immediately reduced in number. Outages of any sort became the exception rather than the rule, and in a period of six months only three flashovers have occurred.

EXTENT OF THE SYSTEM

The system of the Pittsburgh Railways comprises some 600 miles of track, the greater portion of which lies within the city of Pittsburgh, but important interurban lines reach Washington, Charleroi, McKeesport, Oakmont, Emsworth and Coraopolis. Originally these lines were all fed from independent direct-current power plants, but with the growth of the system it was not always possible to place a power station at a point where the supply was needed, owing to the absence of coal, transportation and water. This forced the adoption for some of the lines of alternating current, which was changed over for railway service by means of motor-generator substations. The main advantage of the motor-generator was the flexibility of operation and the possibility of using smaller reserve capacity. Some of these sets were driven by induction motors, but the difficulties experienced on account of low power factor and poor voltage regulation soon showed that the disadvantages of this type of motor outweighed the advantages, so that the design swung over to the synchronous motor-generator sets.

Map of the Pittsburgh Railways, Showing Substations

This was in the days of the earliest 60-cycle rotary converters. Increases in capacity of the system were made with this type of equipment, forming a secondary ring outside the metropolitan district. These 60-cycle converters operated very well with the remainder of the system, as they were usually connected to the metropolitan stations through single, long d.c. feeders, and could not exchange any great amount of load. Since these stations were each practically isolated, individual heavy-duty emergency storage batteries were connected with them. These batteries have since been removed from service.

The installation of larger and larger units of power

supply, which took place when the power plants of the railway were placed under control of the Duquesne Light Company in 1913, introduced operating economies which made it possible gradually to replace the d.c. power stations, some of which were by this time obsolete, with a.c.-d.c. substations. By this time some of the earlier operating difficulties of 60-cycle converters had been ironed out, and due to the greater efficiency and less floor space required, the standard was changed over to the rotary converter station. After 1915 all new stations erected were equipped with rotary converters, although additional motor-generator sets were placed in existing stations.

SUBSTATIONS NOW HAVE SUPERSEDED POWER PLANTS

At the present time all of the d.c. plants have been superseded with substations, with the exception of one at the heart of the downtown district, which still is maintained for stand-by service. The locations of the substations are shown on the map. There are now six stations feeding the metropolitan district, consisting of

All the stations operate in parallel on the d.c. side and, with the exception of one, are fed from a common a.c. bus.

USE OF ROTARY CONVERTERS INTRODUCED NEW PROBLEMS

The change from isolated d.c. power plants to this combination of substations introduced some new operating problems. Any disturbance on the a.c. supply now affected the entire railway system instead of only isolated portions as formerly. This effect manifested itself in various ways. If the disturbance affected the voltage only, the load was shifted to the motor generators, whereas if the frequency dropped the load was shifted to the rotary converters. In the case of the induction-motor generators, it was even possible to have a momentary interruption to the a.c. supply without dropping the machine from the line.

At the same time this changeover from power plant to substation was taking place, extending as it did over a period of ten years, there had come about a great change in the transmission system, which supplied the stations. Whereas at first the substations were fed individually from separate transmission lines radiating from the a.c. power houses, today the substations are tapped off of a complicated interconnected system of 66,000-volt, 22,000-volt, and 11,000-volt transmission lines, practically all of which are operating in parallel at the separate voltages.

As the changeover approached completion, it was noticed that the power supply was not as reliable as formerly. On one occasion a failure at one of the smaller suburban substations spread out so that the load transferred to other substations opened feeder or machine switches at four additional stations, knocking them off like a row of dominoes. On another occasion a flashover in a metropolitan station dropped it from the line, kicked two others off completely, and pulled out feeders from three other stations.

The d.c. feeder distribution system, shown in an accompanying illustration, indicates the resistances in the tie line between the stations for the metropolitan district. A study of the distribution system showed immediately that compound operation, either of motor-generator sets or rotary converters, was undesirable. In case of trouble on the d.c. feeders, the tendency of the rotary converters was to pick up most of the load. This was due primarily to the low resistance between the d.c. buses and the various stations, which allowed considerable load to shift from one station to another in time of trouble.

Diagram Showing Relative Resistance on D.C. Feeder System Between Substations

the d.c. power plant, whose capacity is 6,400 kw.; two rotary converter substations with a capacity of 15,200 kw., and three motor-generator substations with a capacity of 12,900 kw. Surrounding this central area there are eleven suburban stations, of which eight are rotary converter stations, having a total capacity of 13,300 kw., and three are induction-motor-generators with a capacity of 4,000 kw. In addition there are five interurban substations with a capacity of 4,100 kw.

In order to prevent this additional load from building up on one machine and pulling out another station entirely, it was decided to apply as far as possible the method of shunt operation to all of the substations. Shunt operation began early in 1923 at all of the substations on the Pittsburgh Railways except one where special conditions prevented it. The results were immediate and surprising. Outages of any sort became the exception rather than the rule. At the same time a more complete study of the a.c. power supply and the development and application of an adequate relay system to isolate defective lines resulted in a much more continuous supply of power. However, eliminating this factor entirely, and giving account only to those troubles occurring within the station itself or coming in over the d.c. distribution system, the results obtained exceeded expectations. Almost complete continuity of service followed, probably as near 100 per cent as will be possible in practice.

In the thirty days before shunt operation of nine converter stations there were sixty-two outages for a total of 401 minutes, thirty-four of which were flashovers. For thirty days after shunt operation began, there were twenty-five outages for a total of 151 minutes, of which only three were flashovers. It is not to be understood that all the above outages represent serious delays to service. In most cases the station was small and the outage affected only one or two cars, while in others one feeder was affected for a minute or two. However, the above figures for the two periods were made on the same basis, so that the results are comparable.

Shunt operation bettered the commutating characteristics of the machines in all the stations, so that higher time and current settings of the protective devices were permitted. The overload feature on the carbon circuit breakers on the d.c. side of the machine became practically unnecessary, as with reverse-current, overspeed, and overload a.c. devices the machines are protected adequately. Even where these latter devices were not in use, in such cases the d.c. circuit breakers were equipped with time delay devices and set to 150 per cent overload.

RESULTS ESPECIALLY GOOD ON NON-INTERPOLE CONVERTERS

The effect of shunt operation was especially noticeable in the case of the old non-interpole compound converters, on which the short-circuited series fields acted as a damping winding. The capacity of these old machines actually was increased, and it was possible to set the d.c. breakers to 200 per cent overload. Where before flashovers had been of almost daily occurrence, they now became extremely rare. At four stations there were sixteen flashovers in three months after shunt operation began, whereas for the corresponding time a year previous there were sixty-six flashovers at these same stations.

The elimination of rapidly fluctuating loads and of flashovers also has reduced maintenance costs. Brushes do not wear so rapidly nor do the commutators require so frequent dressing. The brush-holders and springs do not need renewal so often. No difficulties as to commutation, heating of fields or other operation have been experienced. Neither has there been any noticeable change in efficiency, even though particular attention has been paid to checking this item. A somewhat closer watch on the power factor must be made by the

operator, but this is not burdensome. There has been no noticeable increase in heating of the tap coils.

The accompanying tables show the total station outages for each of the six city stations for the first six months of 1923, as compared with the corresponding data for 1922. The total number of outages has been reduced from forty-five to twenty-nine, while the time of the outages has gone down from 475 minutes to 228 minutes. While the mixed assortment of motor generators and rotary converters on a railway system is not desirable, yet with such a system the shunt rotary converter seems to be the logical cure for many of its operating ills.

Minneapolis Valuation Before Minnesota Commission

Cost to Reproduce the Property is Submitted by Engineer for the Company on Six Different Bases of Unit Costs—Going Concern Value Placed at \$6,000,000

THE Railroad and Warehouse Commission of Minnesota opened hearings on Oct. 8 to determine the value of the property of the Minneapolis Street Railway. Upon the valuation fixed by the commission at this hearing will depend the rate of fare to be in effect in Minneapolis. The company now has a 6-cent fare, which is lower than that established in many cities of the size of Minneapolis, but the city is endeavoring to reduce this rate. The present case was started in 1921 and after a conference of the valuation engineers for the company and the cities of Minneapolis and St. Paul with the commission it was decided to make valuations of the property on five bases. The September, 1923, basis was added on account of the delay in beginning the hearings.

Mr. Drum of A. L. Drum & Company, consulting engineers, Chicago, on behalf of the company submitted to the commission valuations of the property on these six bases, which are itemized by classes of property in the accompanying table.

The property covered by the valuation comprises the entire street railway system located within the corporate limits of the city of Minneapolis. This comprises the property of the Minneapolis Street Railway, the Minnetonka line and the Como Terminal property. The Minneapolis Street Railway also operates two suburban lines extending outside of the corporate limits of the city of Minneapolis. These suburban lines comprise the Columbia Heights line and the Fort Snelling line. Passengers are transported for one fare on all lines located within the city limits and on the Columbia Heights and Fort Snelling lines extending outside the city limits. The present rate of fare on these lines is 6 cents.

An inventory and appraisal was also prepared of two other suburban lines extending outside the corporate limits of Minneapolis. These comprise the Robbinsdale and St. Louis Park lines, which are operated outside the corporate limits of Minneapolis by the Minneapolis and St. Paul Suburban Railroad for an additional 3-cent fare from the city limits to Robbinsdale and an additional 5-cent fare from the city limits to St. Louis Park, respectively. The inventory and appraisal were prepared so that each of the above described properties was treated as a separate and distinct unit.

THE COST TO REPRODUCE NEW AND THE ORIGINAL COST OF THE PHYSICAL PROPERTY OF THE MINNEAPOLIS STREET RAILWAY COMPANY, INCLUDING ALL PROPERTY IN THE CITY OF MINNEAPOLIS AND THE COLUMBIA HEIGHTS AND FORT SNELLING LINES EXTENDING OUTSIDE OF THE CITY LIMITS AS OF JAN. 1, 1922. THE VALUE OF THE ROBBINSDALE AND ST. LOUIS PARK LINES EXTENDING OUTSIDE THE 6-CENT ZONE LIMITS ARE ALSO SHOWN

Grand total.....	\$29,185,400	\$39,050,940	\$49,656,115	\$45,449,977	\$27,650,935	\$48,193,536

The total inventoried property principally consists of 227.764 miles of single track; paving; lands; power distribution system, consisting of overhead trolley, feeder lines, underground conduit and underground wire; rolling stock; carhouses, offices and miscellaneous buildings; a steam turbine power station supplying power for the operation of the Minneapolis, St. Paul & Suburban systems; six rotary converter substations and miscellaneous electrical equipment at the Lower Dam Water Power Station; furniture and fixtures; tools, etc.

The valuation of the physical property was made from a complete and detailed field inventory of the property. The cost to reproduce the physical property new represents the minimum amount of capital required actually to reproduce the physical property of the company as of Jan. 1, 1922, on the six different bases of unit costs.

WATER POWER LEASES AND GOING CONCERN VALUE

The value of the water power leases to the Minneapolis Street Railway was based on the saving they effect, this saving being computed on the basis of the total cost of the electric power purchased under these leases and the total cost of manufacture of that power if generated at a modern steam power station. The total saving to June 1, 1937, was prorated between the Minneapolis Street Railway, the St. Paul City Railway and the Minneapolis & St. Paul Suburban Railroad on the basis of the total kilowatt-hours used by each company. This element of value was included at \$1,032,123.

The presentation of the claim for "going concern value" was made generally on the basis that the Minneapolis Street Railway had passed through the following stages of development:

1. Construction period.
2. Development period of construction.
3. The period of development into a successful going concern.

The engineer submitted that the fair going concern value of the property was determined to be not less than \$6,000,000. One element in determining this going value was the historical development cost, which was summarized as follows:

Horse, steam and cable lines, 1875 to 1891.....	\$1,878,007
Initial electrical development, 1890 to 1903.....	2,628,800
Track renewed before end of useful life.....	1,332,803
Total.....	\$5,839,610

Another element of going concern value submitted was that due to the consolidated operation with the St. Paul street railway system. This was given as not less than \$2,000,000, measured by capitalizing the estimated saving per year to the Minneapolis company of the increased economy in operation due to such consolidated operation.

New Type of Safety Zone in Bridgeport

THE Department of Police in Bridgeport, in co-operation with the Bridgeport division of the Connecticut Company, has been installing a new type of safety zone illustrated in the accompanying engraving.

The area of the zone, which is about 12 ft. x 25 ft., is indicated by a stripe of white paint 1 ft. wide on the pavement. The peculiarity of the zone, however, is in the upright post. This is a 1-in. pipe painted white,

This Safety Zone Post Has Crossarms for Carrying Warning Notices and Lanterns

about 4½ ft. high and fitted with long crossarms. Each of the latter carries a shield, as shown, with the following letters: "Safety Zone, Department of Police." Each arm also carries a red lantern for use at night.

The post is supported in a cast base.

Cleveland Railway Studies Concrete Poles

Experiments Indicate that the Original Type of Reinforced Concrete Pole Contained More Material than Necessary to Secure Adequate Strength—Steel Poles Are Used on Curves and to Support Heavy Special Work

AN EXTENSIVE series of tests has been made by the Cleveland Railway to determine the relative value of different types of concrete pole for use in overhead construction on tangent track. The primary object of the investigation was to design a pole of sufficient strength, but which would require less material in its construction than did the types previously in use.

The first use of concrete poles by this company was in 1912, prior to that time all poles having been either wood or steel. Some of the latter were of small size, with only a 5-in. butt, although the more recent steel poles were larger. Many concrete poles are now used in Cleveland on tangent track, but steel poles are preferred on curves and for heavy special work, as it is believed that the former are not strong enough for such use.

The reinforcing design of the original concrete poles consisted of eight 27-ft., $\frac{3}{4}$ -in. square rods placed at the corners of an octagon. No transverse reinforcing was used. From an examination of poles constructed in 1912 and recently removed, it was found, however, that an additional rod not called for in the design, had been placed in the center of the pole. Only slight changes had been made in the design during the ensuing years, and the reinforcing in use at the time the tests were made consisted of six 27 $\frac{1}{2}$ -ft., $\frac{3}{4}$ -in. square twisted bars, two $\frac{3}{4}$ -in. square deformed bars 16 ft. long and one $1\frac{1}{2}$ -in. round bar 24 ft. long placed in the center of the pole.

It was felt by the engineers of the company, as well as by the engineers of the city, that more material was being used in the construction of these poles than was necessitated by the strain to which they were subjected.

This Shows How the Concrete Pole Was Blocked in Between Two Pairs of the Stanchions Used in Straightening Car Bodies

The maximum loading on a pole used in tangent construction was estimated to be 1,000 lb. According to their theory there is 820 lb. horizontal pull of the span, 49 lb. wind load on the trolley wire and 135 lb. wind load on a 1,000,000 circ.mil cable, making in round numbers a total loading of approximately 1,000 lb. The point of application of this load was considered to be 18 in. from the top of the pole and 20 ft. above the ground line. The maximum bending moment to which the pole would be subjected is, therefore, 20,000 ft.-lb.

With these ideas in mind a new pole was designed, particular attention being paid to the proper distribution of steel. One less rod was embodied in the new design and all of the rods were of smaller size than had previously been used. In spite of that, however, the forecast was made that the new pole would fail in compression rather than in tension.

Uniform spacing of the reinforcing rods is achieved by spacer rings of $\frac{1}{4}$ -in. round stock. The placement of rods in the concrete poles made up to that time had

Section A-A

Section B-B

New Reinforcement Design for Concrete Poles

Section C-C

been more or less irregular. In the new method of assembling, four $\frac{3}{8}$ -in. deformed bars which are 27 ft. 8 in. long are first wired to the rings so that they form the vertices of a rectangle. After these are firmly fastened four other $\frac{3}{8}$ -in. deformed bars 18 ft. long are then wired to the rings. It was the contention of the engineers that steel placed in a transverse direction would be useful in giving greater strength to the cage. Soft iron wire No. 12 gage is therefore wrapped spirally the entire length of the cage with a space of 3 in. between turns. Difficulty was experienced at first in wrapping this wire so that it would bind the cage tightly enough to prevent its collapse. This was overcome by making with a pair of pliers, a kink in every slack turn of the wrapping wire and tying it to the rods on every third turn. This drew the wire much

tests showed a strength of 3,690 lb. per square inch for the new mixture and 2,370 lb. per square inch for the old mixture.

The apparatus used for testing the strength of poles is shown in the accompanying illustration. The butt is blocked in between the stanchions used in straightening car bodies. Poles are blocked at the extreme end and again at the ground line, 6-in. x 6-in. timbers and a screw jack being used in each case. The load is applied by means of a chain fall fastened at one end to the stanchions and at the other end to a point 18 in. from the top of the pole. A dynamometer is placed in line next to the pole, so that the exact magnitude of the force being applied at any particular moment can easily be determined. The deflections of the poles under load are read by means of a transit.

As a typical example of the experiments, we may take a test of a pole with the 1-1.9-2.3 mixture and the new cage. This pole was 11 in. square at the butt and 10 in. square at the ground line. A load of 500 lb. was first applied, causing a deflection of $1\frac{1}{2}$ in. Thereafter the load was increased in increments of 500 lb. until a total of 2,000 lb. was reached. Deflections were respectively $4\frac{1}{2}$ in., $6\frac{1}{2}$ in., and $10\frac{1}{2}$ in. The load was then eased off to nothing, and it was found that the pole had a permanent set of $\frac{3}{4}$ in. Then 1,000 lb. was applied, producing a deflection of $5\frac{1}{2}$ in. After reapplying a load of 1,500 lb. the increments were 250 lb. at a time, producing deflections of $9\frac{1}{2}$ in. at 1,750, $10\frac{1}{2}$ in., and finally $12\frac{1}{2}$ in. at a loading of 2,250 lb., when small cracks began to appear in the concrete. At 2,400 lb. the pole failed before the deflection could be taken. The load was then eased off to 2,250 lb., when the deflection was $16\frac{1}{2}$ in. Continuing to ease off the load, it was found that the deflection at 2,150 lb. was $28\frac{1}{2}$ in. When the load had been taken off altogether, the pole had a set of $16\frac{1}{2}$ in.

The method of testing was varied somewhat with the different poles, and a direct comparison of the loads carried by them would, therefore, be somewhat misleading. In some cases the load was increased by increments of 250 lb., and in other cases 500 lb. Moreover, with some of the poles, the experiment was tried of easing off the load to nothing at frequent intervals during the test. However, the behavior of the poles under the strain was sufficiently similar, so that a few general conclusions were possible.

CLASSIFICATION OF TESTS

The poles tested during this investigation may be classified in six groups. The first group consisted of old poles built and installed at various times since 1912. The dimensions of these poles varied somewhat, but in general they were approximately 11 in. square at the butt and about $9\frac{1}{2}$ in. square at the ground line. They were built with the old reinforcing already described and the old concrete mixture was used. Seven such poles tested all failed on the compression side, at loads varying from 2,400 lb. to 3,000 lb.

The second group of poles to be tested consisted of those using the old concrete mixture and the new reinforcement. This type failed at an average load of about 2,400 lb., but the deflection was less until the breaking point was almost reached.

Poles using the new reinforcement design and the new mixture constituted the third class tested. These likewise all failed in compression as the engineers had foretold except for one pole which was found to have a defective cage. The loads ranged from 2,000 lb. up to

more taut than could be done by hand and bound the cage so tightly that there was no possibility of its collapsing.

After some practice in building these cages it was found that they could be made in about 3.6 man-hours. There seemed to be no reason to change the forms already in use and the old ones were accordingly used. In the present process the cage is placed in the forms first and the concrete is poured upon it. There is a slight tendency for the concrete to stick to the cage and not fill the form unless a stirring rod is used and the mixture poked around.

To change the kinds of material used in mixing the concrete for poles was not considered desirable. In the first place, the old materials were near at hand and easy to obtain. In the second place, a pole of light color and good appearance was desired and it was known that the old material would insure these conditions. Finally, the concrete mixing gang were experienced in the handling and use of these materials. It was decided, therefore, to use the same materials and change only their proportions in the mixture. The standard mixture in use before these tests were made consisted of 1 part of cement, 2.1 parts of sand and 1.3 parts of gravel. After extensive analyses, void determinations, etc., it was decided to use a mixture consisting of 1 part of cement, 1.9 parts of sand and 2.3 parts of gravel.

In order to compare the strength of these two concrete mixtures, six 6-in. tubes, three of the old mixture and three of the new mixture, were subjected to a crushing test, twenty-eight days after being poured. These

Cage Used in the New Pole

2,600 lb., the average load being closer to the latter figure.

Hollow concrete poles which were similarly tested compared well in strength with the solid poles, averaging slightly over 2,000 lb.

Two light-weight steel poles of the 7-6-5-in. type tested at the same time failed at identical loadings. Each of these poles was supplied with a protecting sleeve at the ground line and in both cases failure occurred at the 1,950-lb. load. Larger steel poles of the 8-7-6-in. type were similarly tested. They failed at 3,350-lb. and 3,475-lb. load. These poles were equipped with sleeves, as were the lighter steel poles, but were 30 ft. in length instead of 28 ft.

Inasmuch as the estimated load to which poles will be subjected is only 1,000 lb. and 20,000 ft.-lb. of bending moment, it will be seen from the accompanying chart that all types of pole were well above the strength required. The solid concrete poles all failed at loadings more than twice as great as that which they will have to carry in actual service. The conclusion was accordingly reached that the new pole with the new mixture was an improvement on the earlier design because less material is used in its construction.

COMPARISON OF MANUFACTURING COSTS

The next consideration covered in this investigation was the matter of cost. The older type concrete pole cost \$21 to manufacture. The second type, with old standard mixture and new reinforcement, cost \$18.60; and the new pole, \$15.90. Thus the pole with the new reinforcing design and the new mixture is much more economical than previous designs of concrete poles.

This pole supported so nearly the same load as the present pole that it was felt that its cheaper cost more than offset the slightly greater strength of the old pole and the future use of the new design was therefore recommended as a result of the investigation.

Salvaging Power Plant Stack Soot

THE Norfolk & Western Railway reclaims the soot which falls to the bottom of the one brick chimney which supplies draft for fourteen boilers at its power plant, located near Bluestone Junction, W. Va. Two of the boilers are at present being installed. The chimney is provided with a hopper-shaped bottom, which discharges the soot into a home-made steam ejector. This ejector consists of a 4-in. horizontal pipe, which turns upward into the central aperture of a standard T-fitting. A 3-in. steam pipe leads into one of the other openings in the fitting, opposite to it being a 4-in. discharge to the coal elevator.

The jet of steam playing directly into the elevator pipe creates a powerful suction in the first mentioned pipe, which effectively draws the soot to the T-fitting, after which the steam current carries it along. Just before the soot reaches the coal elevators it passes through a water spray which condenses the steam and moistens the soot so that it does not blow out of the elevator buckets while being carried up to the coal hopper.

It is estimated that 60 per cent of the soot is combustible, and with the power plant operating at an average load (inflating with the full complement of fourteen boilers will be 8,000 boiler-hp.) probably 10,000 lb. of soot will return to the coal elevators in a week.

Some Details of Illinois Central Electrification*

Conversion to Electrical Operation to Embrace Approximately 418 Miles—Details of Plans for Power Generation and Transmission

BY D. J. BRUMLEY

Chief Engineer Chicago Terminal Improvement,
Illinois Central Railroad.

THE general construction program of the Illinois Central electrification in the Chicago district is as follows:

1. Complete the easterly side of a new through passenger terminal; complete the rearrangement of sewers and underground facilities; extend the track elevation and grade separation; make changes in grades that are necessitated by ordinance; be prepared to proceed with the work of electrification; and electrify the entire suburban service within seven years after February, 1920.

2. Electrify the entire freight service north of East Roosevelt Road within three years after the completion of the suburban electrification, or before 1930.

3. Electrify the entire freight service south of East Roosevelt Road within five years thereafter, or before 1935.

4. Electrify the through passenger service not later than 1940, if a certain proportion of the railroads using the lake-front passenger terminal station are operating electrically at that time.

The work of electrification contemplated embraces approximately 418 track-miles. The electrification system to be used was determined by a commission appointed by the railroad company. This body made a careful study of the Chicago terminal situation and compared it with the electrifications of similar properties in the United States and foreign countries. The commission recommended, and the Illinois Central Railroad adopted, the 1,500-volt direct-current overhead-contact system for use in the Chicago terminal area. The details for the electrical system are being worked out, and it is planned to begin partial operation of the suburban service about the middle of 1926. The generation of current can be provided for readily either along the shore of Lake Michigan, Lake Calumet, or the Calumet River, adjoining the electrically operated tracks, and be easily accessible to ample supplies of water.

For tractive power, high-tension alternating current, of probably 33,000 volts, will be converted to 1,500-volt direct current in not less than five substations on the railroad company's right-of-way. The conversion will be by rotating machines; the machines, transformers, switchboards, and auxiliary apparatus being housed in brick buildings of attractive design. The direct-current switching and protective equipment will be of the latest high-speed type.

The overhead system will consist of steel supports spaced approximately 300-ft. centers, for carrying the contact wires, transmission, signal, and miscellaneous power circuits. The overhead contact wires will be supported by messengers of high conductivity, so that over each track there will be sufficient conductor to supply the power required for that track, thus avoiding the

necessity for independent parallel feeders. The contact wires, messengers and their attachment will be made of materials highly resistive to corrosion. The normal height of the contact wire above top of rail will be 22 ft., and it will be suspended from the messenger so as to make its alignment conform to that of the track it serves. As the electrification will be carried out in progressive steps, the spans constructed initially for the suburban electrification will be ultimately extended to include the freight, through-passenger, and such subsidiary tracks as will be electrified. The track rails being well bonded will form a return circuit for the propulsion current and will be cross-bonded at impedance bond locations, thus avoiding any interference with signal track circuits.

SUBURBAN SERVICE WITH MULTIPLE-UNIT TRAINS

Suburban passenger cars are now being purchased for the electrified service, but are being placed temporarily in steam suburban service. The character of the suburban service is such as to make the multiple-unit train the most economical system. Provisions are being made for operating two-car semi-permanently connected units consisting of one motor car and one trail car.

These units will have control apparatus in one end of each car and will operate either singly or in trains of two to five similar units. The service provides for a high rate of acceleration and braking and a normal balancing speed of 57 m.p.h. on tangent level track. The motor cars will be equipped with four 750-volt motors connected in two groups of two motors in series per group with series parallel control.

The braking equipment will be the electro-pneumatic brake for multiple-unit service with a 1,500-volt motor-driven compressor. Power for the control and brake operation as well as for the car lights will be furnished by a motor generator set on the motor car, having a 1,500-volt direct-current motor and a 32-volt direct-current generator with storage battery provided as a reserve. The two-car unit will have a pantograph collector on the motor car only. Electrical heaters will be used, the details of which have not as yet been fully decided.

The cars will be equipped with diaphragms, enabling passengers to move safely and comfortably between cars and thus make advantageous use of all seats in the train. By the use of aluminum alloys and a careful redesign of the original steel suburban car, the weight will be reduced approximately 3,000 lb., reducing the trail car to approximately 89,000 lb.

As there will be no need to purchase electric locomotives for either through main-line freight service or switching service, or for the through passenger service, for several years, no attempt will be made to design such equipment at present.

British Roads Change to Electricity

Within the next two years the electrification of the three lines from Waterloo to Guilford (London & South Western Railway) will be completed. The London, Midland & Scottish group are beginning the change over on the line covering Manchester, Oldham, Middleton, Royton and Shaw, as a preliminary to larger developments. The same group intends to electrify the system to Rickmansworth.

*Abstract of a paper which was published in the proceedings of the American Society of Civil Engineers for September, 1923.

Gross Revenue of Electric Railways Is Higher than in 1917

Census Figures of 1922 Are Given for Nine More States—
Track Mileage Has Decreased Slightly and Net Income Is
Lower in Some Cases on Account of Greater Operating Expense

PRELIMINARY figures of the electric railway census for last year have now been released for several states in addition to those printed in this paper Nov. 3. In a group of seven states west of the Mississippi River there has been a slight decrease in track mileage in every one except Minnesota. The number of revenue passengers, however, has increased in Arkansas, Nebraska, Minnesota, but has decreased in Kansas, Colorado, Arizona and New Mexico. Two of the Eastern states show decreases in track mileage and traffic.

Kansas.—The figures show a decrease of 3.2 per cent in track mileage and a loss of 5.7 per cent in the number of passengers carried. Gross railway operating revenues, however, show a gain due to fare increases of 26.3 per cent, and aggregated \$4,527,397 in 1922 as compared with \$3,585,079 in 1917, while railway operating expenses increased 46.6 per cent, and net income decreased 31.7 per cent.

† Three companies with 17.05 miles of track, which reported in 1917, discontinued operations prior to 1922, and the track of another company was operated under lease.

‡ Includes 47.39 miles in 1922, and 46.33 miles in 1917 lying outside the state, but owned by companies within the state, and excludes 85.44 miles in 1922 and 67.02 miles in 1917 operated in the state, but owned by companies outside the state.

** Chiefly revenues from electric light and power departments of electric railways.

Arkansas.—The figures show a slight decrease in track mileage, while passenger traffic increased by 11.8 per cent in 1922 as compared with 1917. Gross railway operating revenues aggregated \$1,793,277 in 1922, an increase of 38.1 per cent, but on account of the more rapid increase in expenses the net revenues from railway operations decreased 12.3 per cent.

* Indicates decrease.

Conductor's Mirror Reveals Approaching Passengers

BY ERWIN C. SCHROETTER

NOWADAYS the rear platform of the ordinary electric railway car is equipped with folding doors. These doors are habitually closed before the car starts, the process being compulsory where doors and control are interlocked, and being required by rule in cases where the doors are not equipped with interlocking

devices. The conductor, in collecting fares, usually faces toward the rear and cannot see passengers approaching alongside the car from the front. It frequently happens, therefore, that he closes the doors and gives the signal for the car to start just as a belated passenger reaches the rear entrance. In such cases, the passenger is usually left behind, nourishing a natural but unjust resentment against the railway and its representative on that particular car.

To remedy this difficulty and enable the conductor without leaving his post to see a passenger approaching from the front a mirror may be installed on the rear leaf of the door as shown in the accompanying illustration. When the rear folding door is opened, the position of this mirror would be such that a single glance from the conductor would suffice to show him whether there was a passenger approaching from the front. The device is somewhat similar to that which has been successfully used at the front end of railway cars, to enable the motorman from his normal position to see what is happening at the rear end.

Seventy per Cent of Riders Have Exact Fare on Beaver Valley Line

WITH a view to determining the percentage of persons who tender exact fare when boarding a car, the Beaver Valley Traction Company, New Brighton, Pa., recently made a check of the passengers boarding a car on the route operating from Rochester to Beaver Falls and for part of the day through Beaver Falls to Morado Park. The results show that on Sept. 18, on the car checked, 296 passengers presented passes, 1,096 paid cash fares and 120 transfers. Of the passengers tendering cash fare, it was necessary

to make change for 445, or 40 per cent. Sixty per cent, or 651 passengers, paid fare with the exact change. If the number of those who presented the exact fare is combined with those who presented passes or transfers, it is found that 70½ per cent had the exact fare, while change had to be made for only 29½ per cent.

Effect of Fare Changes in Seattle on Passenger Traffic

THAT changes in the rate of fare do not reflect themselves immediately in passenger traffic on a street railway is shown by the experience in Seattle in the past five years. The accompanying chart shows the number of passengers carried, the gross revenue and the operating expenses from April, 1919, to July, 1923. Upon the commencement of municipal operation and until July 24, 1920, the fare was 5 cents. The number of passengers monthly in this period fluctuated between 10,000,000 and 12,000,000, the receipts being practically in proportion. On that date the fare was increased to 10 cents with four tickets for 25 cents. The number of riders did not decrease immediately, but there was a slight reduction up to December, 1920, when the monthly total had fallen to 9,424,000.

The cash fare remained the same through 1921, but on Jan. 9 of that year the ticket rate was increased to three for 25 cents. The chart shows that this caused a further decrease in the number of riders. The figure remained practically at 8,000,000 per month until February, 1923, when a snow blockade reduced the riding materially for a period of about six days.

Pursuant to a pre-election pledge, the Mayor obtained a reduction in fare to a flat 5 cents, effective March 1 of this year. The events leading up to this change were described in the *ELECTRIC RAILWAY JOURNAL* for

Operating Revenues, Expenses and Total Passengers, Seattle Municipal Railway, 1919 to 1923, Showing Effect of Various Changes in Rate of Fare

Aug. 4, page 175. The increase in passenger traffic due to the 5-cent fare was not very large. In fact, the reduction in revenue was so great that pressure immediately was brought to bear on the city administration, and on June 16 the fare was increased to 10 cents cash, with an 8½-cent ticket rate, which had been in effect previous to the agitation for reduced fares. Operating results for June and July indicate that there has been virtually no reduction in riding due to this increase in fare, so that almost the entire value of the change in rate has been realized.

The chart of operating expenses shown beneath that for revenue indicates that while the costs fluctuate to a certain extent along with the revenues, this change is not nearly so great. In other words, the margin between receipts and expenses was practically wiped out during the period of the 5-cent fare.

Public Security Issues in Better Demand*

Progress Being Made in Solving the Special Problems of
the Electric Railway Companies

By HENRY R. HAYES
Stone & Webster, Inc.

WE HAVE witnessed this year in the public utility business in this country a continuation of the great expansion which took place during the years of 1921 and 1922. To provide funds therefor, and for refunding purposes during this period of two and three-quarter years, it has required, in addition to the investment in property of large sums of undistributed earnings, the sale of upward of \$2,500,000,000 of bonds, notes and stocks.

This large volume of financing, in itself one of the major items in the total of all financing for the period, could not have taken place unless the condition and general credit of the industry as a whole were fundamentally sound. In the opinion of the committee they have never been better, though the costs of capital (hereinafter discussed) are high.

Happily, in the interests of the industry and the public served, there is evident, to a marked degree, a steady broadening of the market for utility securities. It is noticeable in two ways—first, in an increased demand from institutions such as savings banks and insurance companies which gather in the small savings of the people, and secondly, in the last three years especially by sales of securities to the extent of many hundred millions of dollars direct by companies to the users of utility service. In the latter instance it has resulted in opening up an entirely new market for securities in small lots on a basis of reasonable costs. We believe this market has still greater possibilities of development. As has been pointed out to members of this association, all such efforts to sell securities which possess investment merit at prevailing market rates should be aided and encouraged by investment bankers. As the estimated annual budget of the industry requires for extensions, improvements, and refunding purposes over one billion dollars, no new possibilities for raising capital should be neglected.

The current year is one in which many state legislatures have been in session. There were more or less active efforts, in some cases political, in six

states to break down state-wide regulation of utilities and to revert to the harmful method of local regulation by the municipalities (so-called "home rule"). Much time and attention has been required of your committee and several group legislative committees, but in every case "home rule" efforts were unsuccessful.

We are dealing with an industry intimately and inextricably bound up in the industrial and social life of the country. It represents a capitalization of close to \$15,000,000,000. The industry is basic and essential to all the people. It is an industry, too, where the profits are now limited and can no longer be subjected to the evils of exorbitant profits too often prevalent in its early history. Viewed in this light, it might seem disturbing that there has existed so much talk and agitation this year for local regulation of utilities, especially in New York State, where there was much agitation for municipal ownership and operation.

Those investment bankers who are identified with the actual sale of public utility securities know full well how sensitive the minds of investors are to any tendency, economic or political, which will, or even might, adversely affect honest investment. Investors seem to possess that kind of instinct which can recognize agitation of a purely political character and are very much disposed to withhold funds from the business while such agitation exists. Continued withholding of funds cramps a utility and the public is eventually not adequately served. It is very unfortunate that voters in general, who naturally are themselves daily users of utility service, do not yet seem to have acquired any such discernment. It has become more evident than ever that a development of local sales of investment securities by operating companies direct to users of service will be helpful in preventing such unfair political attacks.

When administered with the broadest powers and in a judicial manner, state-wide regulation of public utilities has been conclusively proved, in the opinion of your committee, to afford the best guarantees which investors can have in this country for a maintenance of that integrity of investment necessary for a ready flow of money into the business (see annual report of 1922 com-

mittee).† Where such conditions do not exist we find lack of development of the business or higher costs of money or both—conditions which adversely affect the costs of service to the consumer.

A careful study made by your committee of the policies of the various states throughout the country in regulating the industry shows that as to privately owned plants, in the forty-eight states and the District of Columbia only twenty-five commissions have authority in matters of valuation, rates, services and capitalization. While about three-quarters of the states require of privately owned properties their financial reports of operation, and that such reports are open to public inspection, probably less than half of these reports are actually published. We believe that the public and investors are entitled to this information. Your committee does not believe the best operating results can be attained by the industry until the commissions have such broad authority, exercise it judiciously and regularly and publish full financial reports of operations. Furthermore, money cannot be steadily raised at reasonable costs until the country more fully attains this result.

Of those utilities which are municipally owned and operated, only ten state commissions have jurisdiction over rates, services and accounting. It seems essential that voters of communities which are in the utility business should be more actively educated to a point where public opinion will require proper accounting and sound methods of engineering, finance and operation.

ELECTRIC RAILWAYS

Your committee believes that electric railway service is essential to community service, especially for heavy traffic. The field is developing for trackless trolleys and buses, but such transportation should be supplemental to the main system of transportation. While this newer development in transportation has taken place comparatively recently, it is interesting to note that eighteen state commissions already have jurisdiction over "auto buses" and more with partial and limited jurisdiction. This kind of legislation should be encouraged.

The problems of the electric street railways today are those largely incidental to more economical operation and the prevention of unfair competition. Much progress has been made in the solution of both.

The interurban roads are especially hampered by competition on the high-

*Abstract of a report made to the Investment Bankers' Association of America by Mr. Hayes as chairman of its committee on public service securities. Presented at the annual meeting, Washington, D. C., Oct. 29-31, 1923.

†See ELECTRIC RAILWAY JOURNAL, Oct. 14, 1922, page 639.

ways from trucks and buses which do not pay a fair proportion of the tax burdens. The problem of expense of maintenance of the highways alone, aside from the unfairness of the competition for freight and passenger traffic, is serious and perhaps national in scope.

An instance of unfair competition is the Chicago, Aurora & Elgin Railroad-Smith Bus Line, Inc., case. The Illinois Commission granted a certificate of convenience and necessity to the bus line. An appeal to the order of the commission was confirmed by the Circuit Court. The case on appeal was taken to the Supreme Court, which reversed the decision of the lower court and set aside the order of the state commission. The following is quoted from the decision of the Supreme Court of the State of Illinois: (Joseph K. Choate, Receiver, et al., Appellants, vs. Illinois Commerce Commission, Appellee — April, 1923.)

The railroad company has assets valued at approximately \$15,000,000 and a gross operating revenue of substantially \$1,250,000 a year. Notwithstanding the fact that the railroad company operates through an unusually rich, heavily populated section, it is temporarily in the hands of a receiver. The total assets of the Smith Bus Line are three buses purchased in the summer of 1920 at a total cost of about \$10,000. It is safe to say that they are now worth less than one-third of that amount. The commission recognized the financial irresponsibility of the bus line and directed it to provide liability insurance to the amount of \$10,000 for each bus. Passengers in a bus loaded 50 per cent beyond its capacity now have for their protection the privilege of trying to collect \$10,000 from an insurance company. The public has nothing to assure them that the bus line will operate on regular schedule, and it requires no argument to demonstrate that it is incapable of furnishing adequate service to the inhabitants of the two smallest villages in the valley, much less to the 100,000 people living in and between Aurora and Elgin. One accident resulting in a serious injury or death of one person would be enough to wipe out the entire assets of the bus line. If one of the buses were taken out of service the bus line's ability to serve the public would be lessened one-third, and with three buses out of service the public would have no accommodation at all. The financial statement of the bus line shows that it is wholly incapable of supplying additional facilities, whereas the receiver for the traction line is financially able to provide additional equipment, if the transportation needs of the territory demand it. The plan of the bus line is to start from the railroad terminals a few minutes ahead of the cars and to secure what business it can without making an effort to provide adequate service for the territory through which it operates.

The railroads in this country have kept pace with the industrial development and the population increase, and the prosperity of the nation has been due to a large extent to the steady expansion of the transportation system. The savings of hundreds of thousands of investors have been massed to build our great network of railroads, and these transportation systems are entitled to protection from irresponsible competition. If shoestrapping transportation companies, with no money invested in right of way and no reserve capital to provide adequate service or to protect the public from damage, are permitted to drop in here and there and take the cream of the transportation business from the permanent transportation systems, disastrous results are inevitable. If the permanent highways built at the expense of the people are destroyed, these irresponsible bus lines, that profess to serve the public convenience and to supply public necessity, will leave the public to walk or to provide other transportation facilities. Orders of the public authorities to furnish adequate transportation facilities would be unavailing, because the bus lines would be wholly incapable of complying with the order.

The statute provides the means for compelling the existing transportation system to provide adequate service for the public. If the people living in the territory through

which the Aurora, Elgin & Chicago Railroad operates are not being properly served they can file a complaint with the Commerce Commission, which has the power to order whatever change or increase in service the evidence warrants. If the existing transportation company does not comply with the commission's order, then a situation may arise where the public convenience and necessity will require the establishment of another system. The theory of the public utilities act is to provide the public with efficient service at a reasonable rate by compelling an established carrier occupying a given field to provide adequate service and at the same time to protect the existing utility from ruinous competition. (West Suburban Transportation Company vs. Chicago & West Towns Railways, No. 15273.) By this method the public is protected from paying the cost of the operation of competing systems and a return upon a double investment of capital. No doubt the proposed bus line would accommodate a few individuals in the Fox River Valley, but the convenience and necessity which the law requires to support the commission's order is the convenience and necessity of the public as distinguished from that of an individual or any number of individuals. There is some evidence in this record which, if it stood uncontradicted, would support the order of the commission, but the evidence taken as a whole overwhelmingly preponderates against the order. Where it is found that the order of the commission is without substantial foundation in the evidence it is the duty of the courts to set it aside. (Commerce Commission vs. Cleveland, Cincinnati, Chicago & St. Louis Railway, No. 15389.)

The Circuit Court erred in confirming the order of the Commerce Commission. Its judgment is therefore reversed and the order of the commission is set aside.

DISCLOSURE OF INFORMATION

Your committee is pursuing the studies initiated by the 1922 committee with reference to financial information contained in offering circulars as well as in data released by public utility companies. The fact that adequate financial information to some degree at least is not yet being released creates a condition detrimental to the business. We believe that investors should have complete information and that the public is entitled to know what the industry is doing financially. Until these results are accomplished, your committee does not feel that public utility credit will gain that high standing which it has rightly earned.

There exists little difficulty in getting the necessary information as to the steam railroads or the telephone business. Why should there be difficulty with respect to the public utility business, i.e., the gas, electric light, power and electric railways, devoted likewise to the service of the public interests.

Central Electric Traffic Association to Meet Nov. 21

THE next regular meeting of the Central Electric Traffic Association will be held at the Hollenden Hotel, Cleveland, Nov. 21 and 22.

The opening session, called at 10 a.m., will be in the nature of a round-table discussion. At this session all matters of interest to the electric railways, particularly those affecting the various committees of the Traffic Association, should be brought up for discussion. The afternoon session will be devoted to the meetings of the various committees.

The morning session of Nov. 22 will be devoted to reports of committees and such other business as may properly be presented.

A meeting of the chairmen of all standing committees will be held at 2 p.m., Nov. 21, to outline the program and arrange for the necessary committees to conduct the work of the Traffic Association for the year 1924.

Federated Engineering Societies Studying Coal Storage

RESULTS of far-reaching economic and social importance are likely to be attained by the nation-wide study of the storage of coal now in progress by nearly 100 committees of the Federated American Engineering Societies, it is disclosed in a progress report by Dean F. Walker of the University of Kansas, who is directing the field work of the investigations. He said that the final report would be ready about Jan. 1, 1924, and would place at the disposal of the nation the most authoritative information obtainable as to the engineering, chemical and economic factors involved in the storage of coal.

More than 500 engineers are actively engaged in making the study under the direction of a main committee, headed by W. L. Abbott of Chicago. These engineers have found, it was reported to the executive board, that it is necessary to conduct separate investigations to meet peculiar local conditions which are found in various cities and districts.

The executive board authorized the appointment of a special committee to study the report of the United States Coal Commission with the object of ascertaining what engineering conclusions of the commission the Federated American Engineering Societies might adopt.

Executive Secretary L. W. Wallace of the federation, in a report to the board, deals with substitutes for anthracite, saying:

"Upon the eve of the threatened coal strike, F. R. Wadleigh, Federal Fuel Distributor, made an official and formal request that the Federated American Engineering Societies assist the Federal government in its proposed plan of informing the public as to what substitutes could be used, where to secure them and how to utilize them.

"Plans were about perfected whereby the Federated American Engineering Societies could effectively co-operate with Federal and state officials when the strike which made it so immediately necessary to proceed was settled.

"Although the strike is over, yet there is the necessity for such procedure, as anthracite is becoming harder to secure and the cost is steadily increasing. Therefore, it is deemed advisable for the Federated American Engineering Societies to give careful consideration to encouraging such a campaign of education."

Arkansas Utilities Association

THE dates for the convention of the Arkansas Utilities Association have been changed to Thursday and Friday, Nov. 15 and 16.

Maintenance of Equipment

Inspection with Watt-Hour Meters

By O. A. NORENE

Assistant Master Mechanic Omaha & Council Bluffs Street Railway

SYSTEMATIC inspection is important in the care of equipment. At the present time we use two forms of inspection in Omaha—one on the kilowatt-hour basis and the other on the seven-day basis. The kilowatt-hour basis of inspection has proved the most satisfactory. At present only about 50 per cent of our cars are equipped with economy meters; however, the balance of the cars will be equipped in a very short time. These meters are equipped with three inspection dials, "A," "B" and "C," which determine when the car should be held in for inspection.

What we term the "A" or light inspection is made after the car has made approximately 800 car-miles, as calculated from the meter reading. At this time brakes, emergency control, and equipment and motors are inspected and oiled.

The "B" or general inspection at the carhouses includes all of the fifty-three items enumerated on an inspection card. This is made when a car has made approximately 2,400 car-miles, or about once every seven days.

Small cards are furnished for the use of the inspectors, on which the different parts of equipment are enumerated. Each part is checked off, dated and initialed by the man when the inspection is made. Two cards are made out, one of which is retained by the carhouse foreman, while the other is sent to the master mechanic's office. Here a large card is kept, on which the different inspections and car failures are checked off for a whole month. If a car is pulled in between inspection periods for any defect, or for faulty or careless inspection, it can easily be traced to the right man. It is a probability that the period between the two "A" and "B" inspections can be increased materially in the near future.

The "C" inspection, or general overhaul, is made at the general repair shops after the car has made

about 50,000 car-miles. Trucks and electrical equipment are then removed and overhauled and the car body is placed in the paint shop, where it is repainted or revarnished as the need may be.

Tie Bar Reduces Work of Track Construction

A Labor-Saving Device Used to Support the Tie While It Is Being Spiked to a Suspended Girder Rail

By CLIFFORD A. ELLIOTT

Engineering Department Pacific Electric Railway, Los Angeles, Cal.

WHERE a 7-in. 128-lb. grooved girder rail is used in reconstructing tracks in paved streets, the Pacific Electric Railway uses a trench 21 in. deep. When this re-

of steel, $\frac{1}{2}$ in. x 1 in. by approximately 8 ft. long. These are riveted together with countersunk head rivets for a length of 6 ft. to form the handle of the tie bar. At the toe, the bar is bent to give a convenient form when used as a fulcrum, and the two steel bars are spread apart so as to give a head fork width of 6 in. The cross-section is extended downward 18 in. and the ends are then bent outward for an additional length of 6 in. These latter projections act as peavies for holding the tie in position.

In using this bar the laborer puts the fork over the rail and pushes the toes under the tie, then by pressing down on the handle the tie is raised into position and is firmly held for spiking.

At Left, Holding a Tie in Position for Spiking. At Right, Form of Tie Bar Used by Pacific Electric Railway

construction work is carried out under service conditions, the track is usually "cribbed up" while the excavation work is taking place. In this work every fourth tie is left in place under the rail until the 21-in. trench is completed, when full tying of the tracks takes place. The placing and spiking of the permanent ties formerly required six laborers. Four of these, each with a tamping bar, held the tie in position at the ends, while the other two laborers spiked it in place.

A tie bar has now been designed which enables the work to be performed by four men. The accompanying illustrations show the method of using this tie bar.

The bar is made up of two pieces

Replacing 9-In. Rail by 7-In. Rail Shimmed Up

HIGH cost of maintenance recently caused the Kansas City Railways to replace track on Walnut Street between Eighth and Twelfth Streets. This piece of track had been reconstructed several years ago, using old rail which after further wear had broken in many places. This short stretch required the attention of a gang of six or eight men almost constantly, replacing broken joints and broken rail. In the former reconstruction, this track had been placed in solid concrete on creosoted ties. All this base was in first-class condition, but the replacing of the 9-in. rail with the 7-in.

rail involved some complications. There was not room to place steel ties except by removing a large amount of concrete. The problem

was solved, however, by placing upon each of the old wooden ties a 2-in. shim, and incasing all, including the base of the rail, in rich concrete.

New Equipment Available

New Model 16-In. Lathe

A LATHE with general head for drive by independent motor, single pulley or with cone pulley head has been brought out by the Pratt & Whitney Company, Hartford, Conn. This is a 16-in. lathe known as model B and is suitable for either tool room or high-speed work.

A compact headstock has been developed for both the geared and cone-head types. By mounting the back gears below the spindle, overhanging parts are eliminated, the headstock is centered over the bed and the operator is given greater freedom of movement. The back gears can be engaged from the front of the machine by means of an eccentric lever located under the spindle nose.

The individual motor drive is equipped with push-button control located conveniently on the front of the headstock. The motor is mounted within the cabinet leg and connects by belt to the main drive pulley. For single pulley the drive is through a guarded pulley at the rear. The cone head has a solid housing and side gears. A hand brake adds to the safety and speed of operation.

The positions of the ratio lever

and rocker arm for any desired feed or thread are instantly located by a large, direct-reading index plate mounted on the quick-change gear box. This device permits rapid setting and checking of the feed in use and makes the gear box foolproof. A smooth, quiet drive to the feed gearing is secured by the use of large spur gears.

Quick withdrawal for thread cutting is accomplished through the regular handwheel by means of a coarse-threaded sleeve on its hub, making it a one-hand operation. A positive stop on the sleeve acting against a similar stop on the carriage does away with any strain on the cross-slide. The lever operating the combined stop and reverse rod is located at the right end of the apron. This is above the lead screw and permits the operator to set the carriage stop without stooping or taking his eyes from the work. The tailstock has a long, solid barrel and a large graduated spindle. This spindle is locked by a long wedge on its lower side in such a way that no loss of accuracy can occur from the locking strain.

The tailstock is clamped to the bed by an eccentric shaft parallel to the spindle, and the same handle provides a means of moving the tailstock along the bed. The usual type of carriage cross adjustment is provided.

Oil Drying and Purifying Outfits

IN ORDER to make it possible for central stations and other large users of transformers, oil circuit breakers, electrolytic lightning arresters and feeder voltage regulators successfully to dehydrate and purify oil with a minimum of expense, the Westinghouse Electric & Manufac-

10 Gal. Oil Drying and Purifying Outfit

turing Company has developed a special type of filtering outfit.

The outfits are made in five standard sizes, divided into two classes according to the size of the filter paper. The three larger sizes are rated at 10, 20 and 30 gal. per minute and the two smaller sizes at 2½ and 5 gal. per minute. A complete outfit consists of a filter press, motor, pump, oil strainer, pressure gage and piping. The sizes up to and including 10 gal. per minute are mounted on an iron base cast with a high rim that forms an enclosure and serves as a drip pan. The 20 and 30 gal. sizes are mounted on a structural iron base and have a sheet metal drip pan.

The filter press proper is made up of a series of flat cast-iron plates and frames assembled alternately with filter papers between them. By means of a screw and lever and a movable cast-iron end block the plates, frames and papers are forced tightly together. The plates and frames are cast with holes in two of the corners. When the plates and frames, with the filter papers between them, are assembled, the holes form the inlet and outlet for the oil.

The filter paper used is a special grade of white blotting paper about

Lathe with Individual Motor Drive and Push Button Control

New Line Truck of Central Illinois Public Service Company

0.025 in. thick. It is prepared from wood pulp and contains no coloring matter or chemicals that might injure the oil. Five sheets, cut to the proper size with holes punched to correspond with the holes in the filter plates and frames, are used between each plate and the adjacent frame.

To obtain the best results in treating the oil it is absolutely necessary that the filter paper when first placed in the filter press be entirely free from moisture. Since filter paper will invariably absorb moisture if exposed to the air for any length of time and must, therefore, be thoroughly dried under heat before it is used, specially constructed drying ovens have been designed for this purpose.

Large Fleet of Line Trucks Used in Illinois

FIVE new line trucks have recently been added to the fleet of speed wagons used by the Central Illinois Public Service Company, making a total of twenty-four trucks of this type now in use. This company operates the Central Illinois Traction Company, the Southern Illinois Railway & Power Company and gives local service in several other localities.

The type of trucks as shown in the accompanying illustration has built-in boxes, racks and receptacles for the various tools needed in line repair work. Wooden tool boxes are located at the rear of the cab, and in addition steel tool boxes are placed on the running board below the cab on either side. A galvanized steel receptacle at the rear of the body is used for carrying rubber blankets. At the left of this compartment is another for carrying live line tools. This is 10½ ft. long and extends under the seat. Another small rectangular compartment beside this is used for carrying pike poles. This also ex-

tends under the front seat. A compartment at the right hand side is used for shovels, digging bars, and other miscellaneous large tools. In maintaining the various lines, the trucks are located in districts and take care of the maintenance of overhead lines, transmission, and distribution systems, of which there is about 1,600 miles, giving service to 205 towns in Illinois.

New Type of Governor

A NEW governor for motor-driven air compressors is being placed on the market by the Westinghouse Traction Brake Company, Wilmerding, Pa. This has been designated type S-16 and distinctive features include a reduction in size, weight and cost, as well as improvements in design of detail parts over the well-known double safety valve type of governor.

The contact fingers are self-contained and incased in molded insulation, so that they can be readily removed as units without special tools. The finger adjustment is permanent, so that there are no screws which may loosen in service. An efficient

Construction of New Type Governor

pneumatic blowout is provided. When the governor cuts out, this, in combination with the peculiar shape of the contacts, insures that the opening arc is lengthened and cooled, so as to extinguish it effectively. Air from the main reservoir line is vented from the switch cylinder into the switch governor whenever the governor cuts in. This aids in discharging copper gases. A self-contained cartridge type of hair strainer is used to protect all parts. Pipe connections are made in a separate base so that no pipe connections need be broken in order to remove the operating parts. Pressure adjustment is made by loosening a locknut with a wrench and using a screwdriver on the high and low-pressure adjusting stems. Both high and low-pressure valves have metal seats.

Handy Type Push and Pull Jack

A HANDY tool for wrecking operations as well as one for which many uses can be found in electric railway shops is the new push and pull jack being marketed by the Duff

Jack Applied for Spreading Operations

Manufacturing Company, Pittsburgh, Pa. The design of this jack is extremely simple, consisting of a steel screw, ratchet with pawl, and two cast steel nuts. The nuts are provided with flat projections on the top and with hook projections on the bottom and on either side. The flat projection is used for pushing operations, while the hooks are used for attaching tackle for pulling.

By the use of chains and hooks, fastened to the nuts, the jack can be used for retracking cars or for straightening bent portions where a direct pull is necessary. The jack has a capacity of 10 tons and when used for pulling the jaws can be extended to a maximum distance of 25 in.; this can be reduced to a minimum of 9½ in. When used for pushing the minimum distance between the flat projections is 8½ in. and this can be increased to 24 in. as a maximum dimension. The jack complete weighs 39 lb.

The News of the Industry

Votes for Franchise

Baton Rouge Electric Company Given Fifty-Year Grants—New Lines to Extend to Suburbs

The taxpayers of Baton Rouge, at a recent election, voted affirmatively on a city ordinance for a fifty-year franchise to the Baton Rouge Electric Company for a railway line to the suburbs, north of the city, where the works of the Standard Oil Company are located. An affirmative vote was also given the Baton Rouge Electric Company for an extension of the franchise on its belt line, thus making both franchises effective for fifty years.

The Baton Rouge Electric Company realized that another line was needed to bring the service up to date and to meet the growing wants of the city, and expressed itself as ready and willing to undertake the work of improvement as soon as it was authorized to do so. The extensions and additions contemplated under the ordinance are said to involve the expenditure of about \$300,000.

Under the provisions of the franchise it is stipulated that the motive power for the cars shall be electric; that the fare for one continuous trip on any line covered by the franchise shall not be more than 5 cents unless ordered changed by the Commission Council of Baton Rouge, the Louisiana Public Service Commission, or any other legally constituted authority. In addition free transfers are to be issued.

It is stipulated that within thirty days after the granting of the franchise and right of way the Baton Rouge Electric Company shall file with the city auditor its acceptance and shall furnish a certified check in the sum of \$5,000 that it will construct and put in operation the said Dixie extension over the streets within two years from the date of grant and acceptance.

It is agreed that the company shall not sell or lease its privileges to any railroad operated by steam coming into the city of Baton Rouge. A provision allows for the free transportation of the police of the city when on duty and in uniform or with badge, firemen and other city employees. The franchise states that a failure to operate the road for thirty consecutive days without cause or the consent of the Commission Council shall operate as a forfeiture of the franchise, the failure to be determined and forfeiture decreed and enforced by any court of competent jurisdiction. A provision is also made that children attending schools in the city shall be furnished transportation at a price not exceeding three-fifths of the regular fare, provided that each

child shall have the right to such reduced fare only when going and returning from school.

Improved Platforms for Golden Rod Yellow Cars

The Interborough Rapid Transit Company, New York, N. Y., gave a demonstration run with four reconstructed cars on its Second Avenue Elevated line Nov. 7. The principal improvements in these cars consist of vestibuling the platform and providing sliding doors to replace the old swinging gates. The new platform arrangement will protect passengers against stormy and unpleasant weather conditions and also decrease the length of time required for station stops during heavy traveling periods. The new doors are electro-pneumatically operated and the door control is so arranged that one man can operate the doors on several cars. This system is similar to that already in use on Interborough subway trains. The run was witnessed by Transit Commission representatives and Interborough officials.

"A Mutual Desire"

LOOK AHEAD

Vol. I OCTOBER 24, 1923 No. 1

A Mutual Desire

Everybody wants better transit.

But better transit depends upon the co-operation of the PUBLIC, the CITY and the transit companies.

Toward this end the B. M. T. begins today the publication of a weekly bulletin.

Let us "LOOK AHEAD" to the realization of our mutual desire.

EDWARD M. DAVE,
Director of the Transit Company

Published by The BROOKLYN-MANHATTAN TRANSIT LINES

B. M. T.

In the hope of giving better transit with the co-operation of the public, the city and the transit companies the Brooklyn-Manhattan Transit Corporation has started the publication of a series of weekly bulletins named "Look Ahead." The first of the series was posted in 2,500 cars of the surface line and of the rapid transit lines in Brooklyn, Queens and Manhattan on Oct. 26. The company aims to make this publication a connecting link of information between the traveling public and the companies. The first message is reproduced herewith.

Arguments Advanced

Supreme Court at Columbia Hears Failings of City of Spartanburg and Its Railway Property

Another act in the drama of the controversy in Spartanburg was acted on Oct. 8, when the Supreme Court held a hearing in Columbia on the petition of the city to make the South Carolina Gas & Electric Company renew operation of its cars or forfeit its franchise.

The argument for the city, which was presented by C. E. Daniel, stressed the original contract existing between the city of Spartanburg and the South Carolina Gas & Electric Company. It was his contention that the commission had no authority to order cars in the city abandoned.

Henry M. Earle, general counsel for the local traction company, took the stand that the commission was guided by principles of common sense and justice, when it ordered abandoned the operation of an unprofitable railway. He said further that the city had been given better transportation than it ever had, and that if the franchise were forfeited, the city would have no street railway at all, because no individual or company would accept a franchise in view of the loss it imposes and of the attitude of the city administration toward this business proposition. He said that the fact was overlooked by the relators that Spartanburg had, for more than twenty years, the benefit of the services of a utility company built entirely at the expense of outside capital, and that the right of the investors to be protected against the alleged forfeiture had also received little consideration. Further, that the injury the public would receive through the crippling of the utility had also been overlooked.

He referred to the unreasonableness of the city in demanding transportation which was now out of date. He said that the abandonment by the public of the mule cars in 1899 and of the electric cars in 1920 was the natural result of progress and development, and that an established utility should not be required to forfeit its right to exist as an alternative to incurring the loss consequent to such natural changes.

In conclusion, he stated that the relators might, for reasons of their own, attempt to take advantage of the company's position brought about by the changed conditions, but that the commission had been created and organized for the purpose of protecting the rights of the State of South Carolina in its public utilities, and that it had seen fit to stop the confiscation and forfeiture and to protect alike the public utility

company and the investors through considerations that were ignored by the City Commissioners. He said that the company had not declined to furnish service, that the public was not "irreparably" or otherwise "injured" and that adequate service was being and will be afforded under the direction of the commission, which had full authority and jurisdiction.

It will be recalled that cars in the city of Spartanburg were ordered abandoned July 21, through an order from the South Carolina Railroad Commission. Following the actual stopping of the cars, the company maintained the regular schedule on the interurban lines from the city limits on the western side of the city to Saxon mills and on the eastern limits to Clifton and Glendale Mill villages. The various steps in the controversy have been followed from time to time in these columns.

In the meantime the company is operating buses in the city of Spartanburg proper, which are giving satisfaction to the patrons, and the company, at the same time, is continuing the electric railway service on the suburban line, which runs about 10 miles beyond the city limits. Since Oct. 8 no step has been taken by the court, and undoubtedly some time will elapse before a decision will be rendered.

Following the hearing, the city on Oct. 20 filed an additional argument which quotes at length from the decision rendered by the court in connection with the New Jersey traction difficulty.

Chamber of Commerce Boosts Company's Position in Richmond

The Chamber of Commerce of Richmond, Va., recently adopted the following resolutions:

Whereas the Virginia Railway & Power Company, inspired by an abiding faith in the fairness of the people of Richmond, has lately expended and authorized to be spent large sums of money in order to secure the adequacy of its service to the public and make its proper contribution to the general prosperity and growth of the city, and

Whereas this substantial expression of good faith has stabilized and improved business conditions; therefore, be it

Resolved, That the Chamber of Commerce of the city of Richmond, Va., urge upon its members and other civic bodies, and the public in general, a united effort to secure for the company through the City Council such revision of its franchise obligations as will insure a fair and equitable franchise and establish for the company a credit base to enable it to provide adequate, satisfactory service to the public.

The company is fighting for a recognized valuation for rate-making purposes in Norfolk at the present time and better conditions in Portsmouth, which will appeal to the public lender and increase the stability of the company's stocks and bonds. The same is true in Richmond, where officials are unable to carry out improvement programs because the city has not passed on its application for a blanket franchise to cover a number of old existing franchises which have begun to expire.

In a new statement, printed in *Public Service News*, the Richmond bulletin of the company for car dis-

tribution, now current, the company says, in commenting on its expenditures, that public utilities must always be in a position of inviting new capital, and that new capital is attracted only by prosperity on a sound economic financial basis.

Denies Commission Jurisdiction to Order Extensions in Los Angeles

A ruling of the State Supreme Court of California revealed on Oct. 31 that the writ of mandate sought by the Hollywood Board of Trade to compel the State Railroad Commission to assume jurisdiction of and to hear and determine a complaint against the Los Angeles Railway Corporation, which the Hollywood Board of Trade had filed with the commission, was denied.

Since 1918 the Hollywood Board of Trade has vigorously sought the right to place the power with some municipal or state board or commission to force the Los Angeles Railway Corporation to extend its lines into the Hollywood district of the city of Los Angeles. At various hearings the California State Railroad Commission has taken the stand that it did not have the power to order the extensions as the Hollywood district was already adequately served by the local lines of the Pacific Electric System, and it was the opinion that the line extensions would produce duplicate service in territory already supplied with car service. Also, in the particular territory into which extensions were sought the present fare of the serving line was 10 cents. It was the issue of the Hollywood Board of Trade that the extension of the other line would produce a 5-cent fare.

The Los Angeles Board of Public Utilities took the stand that it could not comply with the Board of Trade's petition and order the extensions, as the City Attorney of Los Angeles ruled that under the terms of the city's charter the Board of Public Utilities did not have authority to issue such an order.

It was suggested to the Board of Trade of Hollywood that it file a suit to determine who had jurisdiction.

After the Board of Trade had filed its original petition to the commission to order the line extensions, the commission saw fit to dismiss the application at a hearing held in Los Angeles, as the Board of Trade failed to present sufficient evidence to support its application that the ordering of such line extensions by the commission into Hollywood would be to the advantage of all parties and the public in general provided the question was determined by the courts prior to an exhaustive hearing on the merits of the case.

The court held that the question was a municipal matter and that the public utilities act, in so far as it seeks to confer jurisdiction upon the State Railroad Commission to order a street railway to extend its lines into a new territory in which it has no franchise, is ineffective for that purpose and to that extent void.

Tax and Free Transportation Are Heavy Burdens

The City Council of Seattle, Wash., recently referred to the franchise committee a petition of the privately owned Seattle & Rainier Valley Railway asking relief from its franchise requirements that it pay the city a gross revenue tax of 3 per cent, and also give policemen, firemen and other city officials free transportation. The petition recites that the company is unable to earn dividends on all its stocks, but nevertheless has removed the disparity in fares between the Rainier Valley line and the Seattle Municipal Railway by eliminating the transfer charges and by selling school tokens twelve for 25 cents. The company will be unable to continue these concessions if the tax and free transportation requirements are continued, the petition avers. The Rainier Valley company also asked repeal of an ordinance requiring the company to pave a portion of its right of way in Rainier Avenue between Morgan Street and Graham Street, asserting the work was unnecessary, and that the cost, \$39,600, including replacements of tracks, would be a heavy strain on the company's finances.

Partial Service Resumed in Saginaw

Partial resumption of street car service with the motor bus as an auxiliary has taken place in Saginaw, and within the next ten days, according to present plans of the officers, the entire Saginaw Transit Company will be in operation.

Service was started on Nov. 1 as an aid to the merchants who observed the annual fall Dollar Day, which a majority admitted was the largest since Dollar Day was begun several years ago, and most of them asserted that the improved city transportation service had a great deal to do with the success of the merchandising event.

The company was not ready to commence operations, but it was decided to start two complete car lines and three motor bus routes to aid the jitneys that have been serving the city since the suspension of street car service on Aug. 10, 1921.

Just as rapidly as track and overhead repairs are made additional cars will be placed on the lines, Charles S. Kressler, general manager of the company, says. Special crossings, diamonds and switches that have delayed work have been received and are now being installed. Although the jitney buses are giving the company competition, this will not be for long, as their licenses expire Nov. 30, and in the meantime the City Council will pass necessary legislation to prevent all competition with the car company.

Mr. Kressler has started advocating the best patronage for the car lines. His opening campaign launched with the merchants of the city whom he addressed was referred to in detail in the Oct. 27 issue of the *ELECTRIC RAILWAY JOURNAL*.

Governor Smith Optimistic

More Republicans in Assembly, but New York's Democratic Governor Is Hopeful About Traction Program

In spite of the personal appeal of Governor Smith to the voters of the state of New York to give him a Democratic lower house in the Legislature, the people up-state did not enthuse in support of the proposed public utility control and hydro-electric development legislation. As a result of the election on Nov. 6 the Assembly is Republican by an increased majority.

It is anticipated, however, that the Republicans will propose compromise legislation dealing with public utility regulation and power development. The most that can be expected, however, is some attempt to solve the New York City traction muddle, and that some effort will be made in this direction by the Republican Assembly leaders seems certain with a Gubernatorial and Presidential campaign coming on next year.

Under the Hearst-Hylan plan defeated in the Legislature this year, the functions of the Transit Commission, with jurisdiction in New York City, would have been transferred to the Board of Estimate and Apportionment of New York City. Among the objections raised by the Republicans was that the program advanced by the Democrats did not insure the permanency of the 5-cent fare and did not require municipally operated lines to be self-sustaining, but that it left the Board of Estimate the power to increase rates and provided for the concealment of losses and merging into the tax rate.

The Republicans also opposed the appropriation by the city for bus lines.

NEW PLAN FOR TRANSIT COMMISSION

It is said that Governor Smith has a plan under consideration calling for the elimination of the Transit Commission appointed by Governor Miller, but which will recognize the principle of state regulation of transit lines. All functions now performed by the Transit Commission in connection with the planning and construction of new transit lines would be recognized as city functions and shifted to the Board of Estimate or some agency created by the city for the purpose of taking over this work. It is said that Governor Smith will submit a transit proposal which in the main will follow the lines suggested by the Republicans in the Assembly at the conferences with Governor Smith in the closing weeks of last year's Legislature.

What the Governor regards as a necessary prerequisite for the solution of the traction difficulty is to break the deadlock between state authority and city authority. It is said that a compromise is now possible, for while the Republicans with their majority in the Assembly would have the power to prevent abolition of the Transit Commission, Democratic leaders can't see any

reason why they should want to exercise that power as long as this contention for the principle of State supervision is not disregarded.

News Notes

Propose Thirty-eight per Cent Increase.—Proposals of the employees of the Worcester Consolidated and Springfield Street Railway Companies in connection with a contract to replace that which expires Dec. 31 call for an eight-hour day, a maximum of 80 cents an hour for regular blue uniform men, 95 cents an hour for one-man car operators and a 30 per cent increase of pay for miscellaneous employees. As computed by the company officials, the employees' proposals call for an increase of 38 per cent over the existing rates, figured on the hourly basis, or 22 per cent when figured by the day, plus the reduction of the workday from nine to eight hours. In the case of one-man car operators it is figured that the increase would be 44 per cent, on the hourly basis. The increased wage for platform men would be \$5.60 minimum to \$6.40 maximum, per day of eight hours, and \$7.60 for one-man car operators. The companies propose 58 cents an hour as the maximum, as at present, with an additional 5 cents an hour for one-man car operators, and elimination of certain bonuses. The first conferences took place on Nov. 5.

Comments on Power Situation.—Alexander MacKenzie, president of the Brazilian Traction, Light & Power Company, was among the arrivals on the S.S. *American Legion* of the Munson Steamship Line in New York recently. Sir Alexander reported that his company, which furnishes all the traction, light and telephone service to Rio de Janeiro and São Paulo, Brazil, is completing a new 160,000-hp. plant 100 miles from Rio de Janeiro. He also said that the present plant, which only provides 75,000 or 80,000 hp., was not only inadequate but that the water supply in that section was running low.

Men Want Conferences.—The street car men's union has renewed its request of the directors of the United Electric Railways, Providence, R. I., for a conference on its recently submitted draft agreement including a wage increase and the closed shop. In a letter signed by Business Agent Coleman and Secretary Coates the men claim that a proposition which looks to conferences to settle differences is reasonable. The company had called for immediate arbitration.

Wages Increased.—The Frankford, Holmesburg & Tacony Railway, which operates a trolley line to the northeastern section of Philadelphia, has voluntarily granted its employees a wage increase of 3 cents an hour. This makes the new scale 48 cents. The increase, which went into effect on Sept. 16, affects about 100 men.

Disapprove "L" Scrapping.—The trustees of the Boston Elevated Railway are opposed to the removal of the elevated structure and the substitution of subways on the ground that such change would cost \$80,000,000. In a special report to the Legislature recently filed, the trustees say that if \$80,000,000 is to be spent, the money should be used to provide additional service, which would benefit the community as a whole rather than the destruction of lines already built. They concur in the opinion of the transit commissioners who reported in 1913 that the "advantage to be gained by substituting subways for elevated structures are in no way commensurate to the expense."

Pay Increase Granted.—An increase of from 48 to 73 cents an hour to shopcraft workmen on the Washington, Baltimore & Annapolis Railroad has been granted. About 200 men will be benefited by the increase, it was announced by Edward D. Bieretz, business agent of the Electrical Workers' Union. Several weeks ago the men went on strike after failure to get the increase asked for but were persuaded to return to work pending negotiations.

Benefits of Merger Noted.—As the result of recent consolidations, 1,700 miles of transmission line, serving about 14,000 square miles of territory in Illinois, is now included in the properties of the Central Illinois Public Service Company, Mattoon, Ill. The company has taken over eight concerns in central and southern Illinois. The consolidation, according to officials of the company, makes possible the generation and purchase for distribution to customers of about 175,000,000 kw.-hr. in 1923, as compared with 128,000,000 generated during 1922. The new Central Illinois Public Service Company, as the result of the merger, now includes the Middle West Power Company, Canton Gas & Electric Company, Lewis-town Electric Company, Central Illinois Power Company and other utilities.

Franchise Revoked, Cars Still Operating.—Although the franchise of the Waverly, Sayre & Athens Traction Company, in Sayre, Pa., has been revoked, the company is still operating cars between Waverly and Athens. The reason for the revoking of the franchise is bound up with the financial inability of the company to meet all the pavement requirements in Sayre. The borough requires that pavement should be made in accordance with the franchise, i.e., with concrete. The company finished a considerable lot of pavement last fall with tarvia asphalt and intended to finish the remaining $\frac{3}{4}$ mile in the same manner. The Burgess, however, insisted on the pavement being laid with concrete or the franchise annulled. The business men of Sayre have petitioned the Borough Council to reconsider the revoking of the franchise because of the business loss to the merchants and the inconvenience to hundreds of persons who use the line, but the Borough Council refused to take action in the matter.

Foreign News

Proposed Extensions in Province of Milan

Further Electrification of State Railways and a Subway in City of Milan Under Consideration

The Council of the Province of Milan is negotiating with the Italian Government and a number of traction companies to increase the mileage of electric interurbans in the Province of Milan. Apart from a number of electric interurbans and steam tramways which are now in operation, a great number of country bus lines are giving service in the country, generally in a very poor and unsatisfactory way.

The total mileage of new lines to be built for electrical operation in the Milan province is 63. The lines which are now steam operated and whose electrification will be subsidized by the province total 80 miles.

It is further planned to restore about thirty miles of lines which had been abandoned during the war and after the war period. Several of these companies are considering the adoption of Diesel electric or straight gas rail cars on these short lines.

GENOA-MILAN LINE

The Italian State Railways has recently added about 36 miles to its three-phase electric system on the Turin-Genoa-Milan triangle. The total mileage now in service is about 300. It is planned to operate fast passenger trains on the section between Genoa and Voghera at a maximum speed of 77 m.p.h. This will shorten the limited train schedule between Milan and Genoa by about thirty minutes. The distance of 95 miles formerly was covered in two hours and forty minutes, there being heavy grades in the electrified section. The State Railways has estimated that the cost of electrification of the track, exclusive of buildings, track repairs and locomotives, has amounted to approximately 1,000,000 lire per kilometer, while new electric locomotives cost approximately 1,200,000 lire each. It is estimated that, apart from the passenger traffic, it will be possible to move 4,000 freight cars daily between the harbor of Genoa, Milan and the Simplon and Gothard lines toward Switzerland.

FRANCHISE FOR AN UNDERGROUND ROAD FOR MILAN

At the meeting on July 31 of the Milan Municipal Council, Public Works Commissioner Marchetti gave an account of the franchise negotiations pending between the city of Milan and the Milan Metropolitan Railways for the construction of a system of underground electric railways.

This Italian-French-Spanish Corpora-

tion is affiliated with the same interests which control the Paris underground and the Madrid subways, and proposes to invest at least 150,000,000 lire in the construction of three subway lines in the city of Milan. The first line to be built will have as its terminals Loreto Circle, at the northern end of the city where the express and local interurban lines from Monza enter, and the industrial fair grounds at the south. It would have a route mileage of about 5 miles, with fifteen stations. It is proposed to start work this year in order to put the first line in operation by 1925. The two other lines will complete a loop around the city line of Milan and will connect all interurban terminals with the State Railways Central, New and Southern stations and with the Northern Railways station.

ELECTRIC ROAD TAKES OVER BOAT SERVICE

The Italian Minister of Public Works has turned over the operation of the Lake Maggiore steamboat service to the Cisalpine Public Undertakings Company, which is also the owner and operator of the Domodossola-Locarno Electric Railway. From 1916 to the present this steamboat service has been operated by the Italian Government.

New London Underground Railway Offices

To secure greater efficiency and more economic working and administration, a new office building is being erected at St. James' Park Station for the housing of the staff of London's Underground. With the growth in the work it has become imperative that the various staffs, which are now scattered about London, should be concentrated, and to this end designs were prepared for a new office building adjacent to the existing headquarters at Electric Railway House.

Municipal Tramways in England Sold to Private Companies

The Ilkeston Town Council has sold its tramway and electricity undertakings to the Nottinghamshire & Derbyshire Tramway Company and the Derbyshire and Nottinghamshire Electric Power Company, at a figure fully £8,000 greater than the amount required to pay off the outstanding loans. The Town Council is thought to have been fortunate in securing such favorable terms. Some years ago numerous municipalities in England undertook extensive tramway and electric lighting operations, with the idea that the municipalities could operate better and more cheaply than private enterprise. In the case of the smaller towns this has not worked out very well, because the business is done on such a small scale that it is usually uneconomical.

Compagnie Generale Francaise de Tramways

Appropos of the new extension of the accord between the Compagnie Generale de Tramways Francaises and the various municipalities wherein it operates the following figures of the results of recent operations indicate that here, as in so many other cases, the lines are having difficulty in keeping up with the demands upon them, particularly so with respect to the Paris municipal tramways as well as most others in France. Returns have increased greatly, so have running expenses, and the amounts available, or which can be readily had, for real improvements, as well in track renewals as in rolling stock, are by no means adequate. The figures herewith are for eight months' operation, and with the proportionate increase continuing until the end of the year they may well show an augmentation of nearer 15 per cent than 10 per cent. With ulterior increases on the same scale it is certain that a vast system of improvements on all hands will be necessary to cope with the traffic of five years hence.

	Receipts in France Eight Months 1923	Receipts in France Eight Months 1922
Marseilles....	29,970,811	28,210,906
Le Havre.....	5,778,209	5,656,781
Nancy.....	4,305,534	3,934,992
Orleans.....	965,474	897,594

The total increase is 2,319,756 francs, which for the proper standard of comparison must be turned into dollars at the normal, not the present, rate of exchange, say 5 francs to the dollar. Marseilles, with nearly a million population, has receipts of around \$8,000,000 a year, and Orleans, with fifty thousand, but \$240,000.

Glasgow Tramway Extension

The tramway department of the Glasgow Town Council on Aug. 1 formally took over the line of the Glasgow Subway Railway and the Paisley & District Tramways as agreed and confirmed by act of Parliament. The subway purchase price was £385,000 and that of the Paisley tramways £250,000. By the addition of these two properties the city's municipal tramway system has been extended by 24 miles, of which 6 miles is accounted for by the subway. The total length of route under the control of the tramway department is now 126 miles.

Narrow Gauge and Top Deck Covers

The British Ministry of Transport has refused to sanction the use of top-deck covers for cars running on the narrow gauge of 3 ft. 6 in. at Chester, on the ground of the risk of overturning, especially from wind pressure.

Debentures Issued. — The London Underground Railway has issued £6,000,000 of 4½ per cent debentures.

Financial and Corporate

Dismantling Likely

Supreme Court Hears Report of Receiver on Northern Massachusetts and Connecticut Valley Systems

That the Northern Massachusetts and Connecticut Valley Street Railway systems would soon be dismantled in large part, if not wholly, was the tenor of evidence and discussion at a hearing given Nov. 2 in Boston by Judge De Courcy of the Massachusetts Supreme Court on the fourth report of Daniel P. Abercrombie, receiver.

The Northern Massachusetts case was considered first. Mr. Abercrombie said the Athol division was operated at a profit and he believed that sale of it as a going concern was feasible. He said the whole property, if sold for dismantling, would bring about \$125,000 and there would be claims of about \$60,000, leaving about 10 cents on a dollar for the holders of \$500,000 worth of bonds. He added that he believed he could do better than this at a receiver's sale.

Taking up the Connecticut Valley system, Mr. Abercrombie said the lines showed an operating loss of approximately \$15,000 since the beginning of the present calendar year, and that passenger revenue in this period had been \$41,000 below the corresponding period of 1920. He asked for authority to issue receiver's certificates in the amount of \$30,000 to pay taxes and power bills.

Bentley W. Warren, appearing for a bondholders' committee and for two banks holding mortgages, offered objections to a receiver's sale of the properties, preferring foreclosure.

Judge De Courcy directed counsel to try to agree on whether the sale shall be by receiver or through foreclosure, on the question whether or to what extent the lines should be operated in the meantime, and what amount of receiver's certificates should be issued.

On the part of Chambers of Commerce in the larger towns involved some discussion has taken place relative to organizing local companies to take over lines in a position to pay profits, and there have also been conferences with bus operators concerning the feasibility of installing a bus service to supplant the trolley service.

Income Lower, Traffic Increases in Detroit

The total operating revenue for the city of Detroit, Department of Street Railways, during September was \$1,843,027 against \$1,532,927. The former figure included revenue from transportation amounting to \$1,766,670. The total operating expenses for the month of September were \$1,360,890, compared with \$1,073,417 for the same

month a year ago. Net revenue from railway operations was \$482,137 in September of the current year. A year ago it was \$459,511. The net income shows a slight decrease over that of September, 1922. A year ago it was \$61,026, and in September of this year it was \$59,213. Total passenger traffic increased from 35,770,063 in September, 1922, to 38,385,837 in September, 1923.

Reorganization of Washington-Virginia Company

A reorganization of the Washington-Virginia Railway is being planned by a noteholders' committee, under which the road has operated for the past three years. The first step in the proposed reorganization will be the filing of petitions in the courts of the District of Columbia and Virginia to have the rights of the various lien holders judicially determined.

The noteholders' committee met in Philadelphia recently and decided to start proceedings for a reorganization. While preparing the court petition, Mattie M. Newcomer, an individual bondholder, unexpectedly filed suit at Fairfax Court House, asking that a receiver be appointed.

The petition for receiver, which was filed by Attorneys Charles H. Merrillat and William M. Ellison, alleged that the company had defaulted in the payment of dividends for the past three years.

The charges brought are that corporation officials have allowed the properties to reach that degree of insolvency through "wrongful misappropriation, waste and reckless improvident and unlawful financing, abuse of its corporate powers and unlawful diversions of proceeds" of several of the bond issues and mortgages.

Judge Samuel G. Brent has ordered that the defendants to the petition show cause why a receiver should not be appointed.

The allegations made extend over a period of time from 1908 to the present. The two lines—the Falls Church line and the Mount Vernon line—were at that time merged. Clarence P. King, who became president of the consolidated companies in 1908, later became president of the Washington Railway & Electric Company.

The Washington Utilities Company, the petition cites, was created under the laws of Virginia by Clarence P. King as "part of a scheme of accomplishing a huge consolidation of street railway interest in and about the District of Columbia and adjoining states."

This scheme, as well as many others, the petitioner says, collapsed, thus bringing about the state of insolvency in which the company now finds itself.

Judgment Affirmed

Supreme Court Rules Philadelphia Banks Must Give Columbus Railway \$1,136,310

The Ohio Supreme Court in affirming the judgment of the Franklin County Court of Appeals in the Augusta Slaymaker case gives the treasury of the Columbus Railway, Light & Power Company \$1,136,310 to be paid by E. W. Clark & Company, Philadelphia bankers. This decision ends one of the hardest fought controversies in the railway field.

The story began in December, 1918, when Augusta Slaymaker and other stockholders of the company brought suit to recover money paid to the Clarks for their services as fiscal agents of the local concern.

In December, 1920, shortly after control of the company had been wrested from the Clarks by Charles L. Kurtz and his associates, leave was obtained for it to enter the Slaymaker case via a cross-petition in which it was sought to recover for the company certain sums which, it was claimed, had been obtained or expended illegally by the Clarks. Included in these sums were commissions paid by the Clarks to themselves on the sale of Rail-Light securities; payments made the Clarks for supervision of construction of certain equipment; losses incurred by the "franchise surrender" in 1918; payments made by E. K. Stewart, treasurer under Clark, to John Scott Anderson, C. C. Philbrick, and others from what was denominated the "Yellow Dog Fund," and other alleged illegal payments and expenditures.

JUDGE KINKEAD SUSTAINS JUDGMENT

Judge George B. Okey was named master commissioner to hear the testimony, and after several months rendered his report, finding for the company on nearly every ground. He was sustained, in the main, by Common Pleas Judge Kinkead, whose opinion scathingly arraigned the Clarks for the way in which they had enriched themselves at the expense of the Rail-Light stockholders, and decreed that the Clarks should return to the Rail-Light the sum of \$1,512,021 and pay all costs in the proceedings.

Although Judge Kinkead was sustained by the Court of Appeals, the amount of the judgment was fixed at \$1,136,310. The principal items follow:

Management contracts	\$224,716.05
Profit on sale of stocks	117,841.72
Franchise surrender	64,659.00
Stewart withdrawals	218,527.31
John Scott Anderson	173,273.40
Total	\$799,017.48

Interest on these amounts from the date of their payment to April 1, 1923, brought the total of the appeals court judgment to \$1,136,310. The Clarks now also must pay interest upon that sum from April 1 to the date of payment of the judgment, and in addition, must pay all court costs as a result of the decision of the Supreme Court.

Charles L. Kurtz, president of the Columbus Railway, Light & Power

Company, said that acquisition of the above-mentioned amount would help toward the improvements and new construction projects that needed to be carried out. He said that new cars were needed as the present equipment was insufficient. His company needs in addition a new power plant which alone will call for an expenditure of approximately \$4,000,000, and car line extensions must be undertaken in the near future.

There still remains the possibility of the Philadelphia bankers having the case transferred into Federal Court. The \$1,136,310 is subject to orders of the state courts and unless restrained by federal action can be paid to the Columbus Railway at once. The various steps in this controversy have been followed from time to time in these columns.

Investigation of Service Resumption in Kewanee Started

An electric railway line will be salvaged from the junk pile if \$140,000 can be raised in Kewanee, Ill., to finance a new company. Pursuant to the stopping of the interurban service between Kewanee and Galva and the city cars in Kewanee recently a representative group of citizens and the board of directors of the Chamber of Commerce have lost no time in delving into the problem of resuming operation of service formerly provided by the Galesburg & Kewanee Electric Railway.

A thorough investigation reveals the fact that new cars and extensive work on the South Main Street line will be necessary, the total cost of the improvements being about \$90,000. This with the \$50,000 which must be paid to David Wine, the junk dealer who purchased the line, brings the total sum needed to \$140,000.

With a capitalization of only \$140,000 the belief is general that the cars can be operated at a fair return. So confident is Mr. Wine, the purchaser, of these possibilities that he has offered to take \$50,000 of stock in the new concern provided a first mortgage upon the property is given him. E. E. Baker, president of the Kewanee Boiler Company, in behalf of that concern, offered to take \$10,000 worth of stock, leaving only \$80,000 to be raised.

Indianapolis Company Wants Loan for Tax Purposes

Approval of the negotiation by the Indianapolis Street Railway of approximately \$150,000 to obtain funds with which to pay taxes of the company was asked by Robert I. Todd, president, in a recent conference with John H. McCardle, chairman of the Public Service Commission. Although the company is maintaining service in Indianapolis with a 5-cent fare, one of the lowest in the country, the revenue of the company is not sufficient even to pay taxes when due, Mr. Todd told the commissioner.

Under the public service commission

law, utilities wishing to make a loan for a period of less than a year are not required to obtain the approval of the commission. Loans made for one year or more must be approved by the commission. Mr. Todd told Mr. McCardle that he was not sure the tax loan could be taken care of within a year.

The financial condition of the company and the continuance of the 5-cent fare in Indianapolis, it is said, depend largely upon the outcome of the application of the Terre Haute, Indianapolis & Eastern Traction Company for a certificate of convenience and necessity to enter the electric field in Indianapolis. The commission and the City Council both approved the plan. The matter was carried to the courts by other electric companies objecting to the granting of the certificate. The action of the commission was upheld in the Circuit Court and the case is pending before the Supreme Court.

The Terre Haute, Indianapolis & Eastern case has a direct bearing on the railway situation, it was explained, because the electric company is to provide electric current for the car company. It has been stated that the saving to the car company on electric current would amount to enough to pay the taxes of the company.

Holdings in Waterloo Relinquished

During a special meeting in Waterloo, Iowa, of the board of directors of the Waterloo, Cedar Falls & Northern Railway, C. D. Cass and L. S. Cass, president and general manager of the traction system, relinquished all their holdings to the bondholders to develop a bus line. They now have big buses operating between Waterloo and Cedar Falls and have made plans to extend their lines to Winthrop on the east. It is believed their future plans will include development of bus transportation in central Iowa.

C. M. Cheney, vice-president of the Des Moines & Central Iowa Interurban Company, was named president and general manager to succeed the Cass brothers in the interurban property they relinquished.

The property is valued at between \$9,000,000 and \$10,000,000, with \$7,500,000 indebtedness against it. Of this amount there are \$5,500,000 in first mortgage bonds, with the company owing the balance of \$2,000,000 to the government.

Cass brothers have sought to have the affairs of the company adjusted to the satisfaction of the bondholders for some time past, since it was seen that the railway was being operated at a loss each month. The average loss a month is approximately \$12,000. The transaction was friendly in every particular.

With Waterloo as a center, the company has lines extending to Cedar Rapids, Waverly and Cedar Falls, besides the city service in Waterloo and Cedar Falls.

Birmingham Receivers Allowed to Default Interest Payment

The lifting of the receivership of the Birmingham Railway, Light and Power Company on Jan. 1 is made possible by a decision of Judge W. I. Grubb of the United States Court for the Northern District of Alabama, allowing the receivers to default in the payment of interest due on Nov 1 on the refunding and extension mortgage bonds of the company. Judge Grubb handed down his decision at a hearing held in Birmingham on Oct. 30.

Some time ago it was agreed that the bonds, which are held by various parties and which amount to \$4,600,000, be deposited with a committee for redemption. It was stated at the meeting held before Judge Grubb that 75 per cent of these bonds have already been deposited with the committee. Arrangements are made to purchase from the committee all coupons due on these bonds Nov. 1. Practically all of these bonds held by parties in Birmingham have been deposited with the committee and many from other places also. There was some difficulty in locating all of the bonds, hence the time for their deposit with the committee was extended from Oct. 31, 1923, to Dec. 1, 1923.

At the hearing held before Judge Grubb Attorney W. B. White of Tillman, Bradley & Baldwin, appeared for the co-receivers of the Birmingham Railway, Light & Power Company, Lee C. Bradley and J. S. Pevear. Attorney Powell C. White of New York appeared for the bond holding committee. There was no protest offered against default in the payment of the 6 per cent interest on the bonds. In all cases where bonds have been deposited checks are being mailed to the holders.

It is intimated that with the lifting of the receivership, which is to take place about Jan. 1, 1924, many improvements will be made by the Birmingham Railway, Light & Power Company, in the way of new equipment and the extension of some of its lines. With the elimination of the jitney and the reduction of cash fares from 8 to 7 cents traffic on the cars has increased considerably.

New Directors Elected in St. John

At the annual meeting of the stockholders of the New Brunswick Power Company, St. John, N. B., the following board was elected: Walter C. Allison, of Manchester, Robertson & Allison, Ltd., St. John; W. S. Fisher of Emerson & Fisher, Ltd., St. John; L. C. Gerry of Bodell & Company, Providence R. I.; W. E. Golding of George McKean and Company, Ltd., St. John; J. L. McAvity of McLean, Holt & Company and T. McAvity & Sons, Ltd., St. John; A. P. Paterson of Baird & Peters, Ltd., St. John; M. A. Pooler, general manager and vice-president of company; E. N. Sanderson, New York, president of the company, and Richard Sullivan, broker, St. John.

Iowa Property Sold

David G. Fisher, president of the Iowa Southern Utilities Company, operating the street railway lines of Centerville, Iowa, and the electric interurban railway between Centerville and Albia, Iowa, and Centerville and Mystic, in addition to serving forty-one cities and towns in southern Iowa with electric power, has sold his entire interests and control of the corporation to George M. Bechtel of Davenport. Mr. Bechtel is president of Iowa's oldest bond house, George M. Bechtel & Company, and a bank director and manufacturer in Davenport.

The Iowa Southern has been a financial success since it was organized by Mr. Fisher and associates in 1916, with four power plants in the vicinity of Leon, Iowa, as a nucleus. In 1919 Centerville's utilities were purchased and in 1921 Newton, Iowa, and adjacent territory were added to the chain.

The corporation's interurban railroad is the outlet for the coal mines of Monroe County, which would not otherwise have easy access to the markets. An approximate tonnage of 100,000 tons is moved over this interurban annually, this being the principal freight handled by the road.

Beginning with a population of 5,000, the Iowa Southern now serves a population considerably in excess of 75,000. Extensive power plant extension and development and transmission line extension have taken place in recent years.

Can't Agree on Third Arbitrator for Substation Appraisal

All efforts of the city of Seattle and the Puget Sound Power & Light Company to appoint a board of arbitration, satisfactory to both parties, to appraise two railway substations to be taken over by the city in November have met with failure. The city and the company have agreed upon two arbitrators, but in an effort to name a third each has selected seven arbitrators, who have been rejected by the other party. James B. Howe, counsel for the company, has asked that Mayor Brown certify, on behalf of the city, that the arbiters named by the two parties have been unable to agree upon a third arbiter, as a preliminary to action by the company to have Chief Justice John F. Main of the State Supreme Court designate the third arbitrator.

Mayor Brown has been advised by Corporation Counsel T. J. L. Kennedy that the Mayor has no authority to certify, except under an ordinance passed by the City Council specifically directing him to do so. The three appraisers are to fix the value of the two substations to be taken over by the city with the first block of 5,000 kw. of the power service now being sold to the Seattle Municipal Railway by the company. The contract by which the city bought the railway lines gave the city the right to reduce the power contract in 5,000-kw. blocks, provided the city

paid the company for the substations. The company has the right, on five years notice, to reduce the power service without requiring the city to buy the substations. The city has served one year notice of its intention to take over the first block and substations in November.

Melbourne System to Be Extended

Plans Under Consideration Contemplate a Total of 266 Route-Miles of Electric Railway

The report of the Melbourne and Metropolitan Tramways Board for the year ended June 30, 1923, shows that its plan for a general tramway scheme, with the abandonment of the present cable line and an increase in the tramway route mileage from 125 to 266 before the year 1940, has been accepted by the Parliamentary standing committee on railways. It is now before the Minister of Public Works. The preparation of this plan occupied the board and its officers for about two and one-half years and provides for probable growth in tramway and railway traffic for twenty years ahead.

On April 5, 1923, the board entered into an agreement with its employees, following the decision of the Commonwealth Court of Conciliation and Arbitration, providing for an increase of pay of 4d. per day to the traffic staff, three days good conduct leave in addition to the usual twelve days annual leave, and time and a half for all work on Sundays and holidays. This agreement will add £60,000 to the annual wages bill. It also provides for quarterly adjustment of wages in accordance with the Commonwealth statistician's cost of living figures. Based on these figures for the quarter ended June 30, 1923, the wages on Aug. 1, 1923, were further increased by the

Population served by tramways.....	667,000

Average number of kilowatt-hours per car-mile	3,035	1,840
Number of employees....		

sum of £55,000 per year. The contract will remain in force until March 31, 1925.

Considerable new construction has been completed during the past year, including a sample center-entrance car which proved so satisfactory in service that ninety others have been ordered. Two single-truck safety cars will be imported from the United States. The number of electric cars now in service is 204, made up of 155 single-truck and 49 double-truck cars. On the cable systems there are 592 grip cars and 597 other cars. New carhouses with sprinklered fire protection have been installed. The program for improvements during the next three years calls for an expenditure of £1,700,000.

Statistics for the year ended June 30, 1923, are given in the accompanying table.

Suit Fails to Compel Payment of \$350,000 Tax

Efforts to force the Cincinnati Traction Company and the Cincinnati Street Railway to pay the city of Cincinnati \$350,000, claimed to be the amount of tax due the city for 1920, failed on Oct. 17, when Judge Stanley Struble, in the Hamilton County Common Pleas Court, dismissed the suit of Attorney Robert S. Alcorn, suing as a taxpayer. The court took the view that the railway, owing to the fact that it leases its properties to the traction company, is not in any sense liable to the city for the payment of the tax, and that this company is entitled to be dismissed as a defendant.

The suit charged that the companies were obligated to pay the tax of \$350,000 annually under the ordinance passed in August, 1918. The plaintiff also claimed that the gross receipts of the defendant companies in 1920 were sufficient to pay the tax, but that the city and the companies entered into a conspiracy to release the companies from the payment. As an end to the alleged "conspiracy," it is charged that the City Council passed an ordinance in 1921, which sought to change the method of accounting so as to postpone the payment of the tax for 1920 to 1922. The acceptance of the 1918 ordinance by which the public became a party in the management of the properties of the defendant companies is mentioned by Judge Struble as enabling the public to escape the fear of it, not the actual exploitation incidental to private control on the one hand, and a large capital investment incidental to municipal ownership on the other.

Judge Struble in his opinion declared the gross earnings were made a trust fund in the hands of the operating company and the remedy of the city for any misapplication or failure to apply them to the purposes named in the ordinance, would be in a court of equity to compel the observance of the obligations of the trust, rather than an action at law for a money judgment.

He says that if the operating company should refuse to obey the order of a court of equity to pay this tax

to the city where the gross earnings were sufficient to pay the tax, the court no doubt would have the power as a means of enforcing its order to render a personal judgment against the operating company.

The court said regarding this:

These claims which counsel made orally are not included in the plaintiff's amended petition and if true make an entirely different cause of action than that stated in the amended petition upon which the parties went on trial. The cause of action to be tried here is the one stated in the pleadings, not the one in the oral statement of counsel. The city of Cincinnati can recover this tax for the year 1920 by merely refusing to agree to further postponements of its payment, thus forcing the traction company to include this tax in the cost of service for future years, thereby increasing its earnings by an increase in taxes.

Alabama Power Takes Control of Tuscaloosa Property

The property of the Tuscaloosa Railway & Utilities Company of Tuscaloosa, Ala., with the exception of the creamery and ice plant, became the property of the Alabama Power Company by the filing of a deed for record on Nov. 1.

The cars in Tuscaloosa are now being operated by the Alabama Power Company, under the superintendency of T. L. Beauchamp, formerly district manager for the Alabama Power Company at Decatur, Ala.

J. M. Barry, manager of retail operations of the Alabama Power Company, with offices in Birmingham, Ala., was in Tuscaloosa on Nov. 1 in connection with the transfer of the railway. He stated that a better service would be given in Tuscaloosa than had been given heretofore. He said the company would at once place voltage regulators on all feeder electric lines, insuring a more even voltage, and will make many general improvements in the service.

The master mechanic of the Alabama Power Company from Montgomery, Ala., is spending several days at Tuscaloosa looking over the rolling stock of the street car company and also examining the tracks. He says improvements will also be made in this branch of the service.

Heavy Deficit Represents Strike Costs.—The International Railway, Buffalo, N. Y., for the nine months ended Sept. 30, 1923, had an operating revenue of \$7,269,457 against \$8,065,828 a year ago. The operating expenses and taxes amounted to \$6,920,570. This represented a decrease in comparison with the nine months ended Sept. 30, 1921, when the operation and taxes amounted to \$7,062,555. The deficit for the nine months ending Sept. 30 of this year was \$792,876, which far and away exceeded the deficit of the same period in 1921, but the loss from operation for the nine months ended September of this year represented strike costs. It will be recalled that the company did not operate full service in 1922 due to the strike on its property.

Auction Sales in New York.—At the public auction rooms in New York on Nov. 7 there were sold \$1,213 South Carolina Gas & Electric Company, Spartanburg, S. C., certificates of indebtedness, 16½ per cent.

Bonds Offered.—Aldred & Company, New York, are at the head of a syndicate which is offering at 95 and accrued interest to yield 6½ per cent \$3,540,000 of the first mortgage thirty-year 6 per cent sinking fund gold bonds series "A" of the Quebec Power Company. The bonds are dated Oct. 1, 1923, and are due Oct. 1, 1953. The proceeds of this financing will be applied to cover the purchase price of consolidated mortgage bonds of the Quebec Railway, Light, Heat & Power Company, Ltd., purchased by the Quebec Power Company and hypothecated in favor of the company's total authorized issue of bond and to furnish funds for further additions, improvements and extensions to hydro-electric power plants, transmission lines and distribution systems.

Order to File Claims.—The United States District Court, Southern District of Ohio, recently ordered Harry Hartwell, receiver of the Ohio Electric Railway & Power Company, which is the defendant in the case of the Columbia Avenue Trust Company, Plaintiff, vs the Ohio Electric Railway & Power Company, to serve notice on the company's creditors that unless they file their claims by Nov. 20 the claims shall be barred. The court said that they must be filed in the receiver's office in the city of Pomeroy, Meigs County.

Net Earnings Increase.—The net earnings of the Illinois Power & Light Corporation for the twelve months ending Sept. 30 are 33 per cent higher than the net of the corresponding period last year, according to figures made public recently. A portion of the big increase for the period is due to additional properties acquired by the corporation during the year. The net earnings for the twelve months amounted to \$8,792,517. In the same period in 1922 they were \$6,801,017. The Illinois Power & Light Corporation was organized on June 1, this year. The twelve months earnings are those of the companies merged to form the new concern. The net earnings for 1923 are more than double the interest charges on the entire funded debt of the company.

Debentures Offered.—A. B. Leach & Co., Inc., and the Federal Securities Corporation, New York, are offering at 98½ and accrued interest, to yield 7.25 per cent, \$2,250,000 of the Public Service Company of Colorado ten-year 7 per cent sinking fund convertible gold debentures. The debentures are dated Oct. 1, 1923, and are due Oct. 1, 1933. These debentures are being issued to provide for part of the cost of the properties being constructed for and acquired by the consolidated company. The Public Service Company of Colorado is a successor by merger to the properties of the Denver Gas & Elec-

tric Light Company and the Western Light & Power Company.

Will Receive Bids.—The Guaranty Trust Company, New York, N. Y., will receive until Nov. 12 bids for the sale to it of the first refunding and collateral trust mortgage 6 per cent gold bonds of the Philadelphia Company. The bonds are known as series "A" and are due Feb. 1, 1944. The amount received must be sufficient to exhaust \$120,079 at a price not exceeding \$105 and interest.

Will Consider Stock Increase.—The Charleston Interurban Railroad, Charleston, W. Va., will hold a meeting of its stockholders on Nov. 27 for the purpose of increasing its capital stock to \$3,000,000, it has been announced by Arthur F. Hill, secretary of the company. The stockholders will act upon a resolution that will increase the present 15,000 shares of stock of the par value of \$100 each to 30,000 shares of stock of the par value of \$100 each. The 15,000 shares of preferred stock are to be issued upon such conditions and with such preferences as may be determined at the meeting. The call for the meeting was issued in accordance with the terms of a resolution adopted by the board of directors on Oct. 19. It is stated that the past year has been one of the most successful in the history of the company, and plans are in process of formation for new equipment, additions and extensions.

Consolidation Being Discussed.—At a special meeting of the board of directors of the Potomac Public Service Company, Frederick, Md., matters pertaining to the consolidation of the properties of the Potomac Public Service Company and the Cumberland plants were discussed. While no announcement was made it was said that definite steps will be taken at an early date to effect a consolidation of the two.

Service Resumed and Buses Purchased.—Service has been resumed on the interurban line that runs from Bryan, Tex., to College Station, where the Agricultural and Mechanical College of Texas is located. This line was recently sold under receivership, and a new company, the Bryan-College Traction Company, capitalized at \$27,500, was organized to take it over. The incorporators of the new company are E. H. Edge, J. M. Lawrence, E. H. Austin and others. An hourly schedule of cars both ways has been in effect and will be maintained during the college year, it was announced by the new owners. The company has purchased three buses put in operation by the students of the college when the interurban discontinued service last year.

Earnings Increase.—The Virginia Railway & Power Company, Richmond, Va., in a nine months financial statement just issued shows gross earnings of \$7,777,696 and a balance after all deductions of \$933,975. Earnings by comparison with last year increased 13.86 per cent. Operating expenses increased 8.83 per cent.

Traffic and Transportation

No Five-Cent Fare Now

Altoona Railway Official Says Problem Is to Exist at Present Rates—Wages Should Attract Employees

That there will be no return to the nickel fare soon and that the trolley company is worrying more at present with the problem of how it can keep going on existing fares, is the summary of a statement by General Manager S. S. Crane of the Altoona & Logan Valley Electric Railway in reply to published statements in local newspapers to the effect that "the return of the nickel street car fare would not occur until a certain regulatory body was dismissed from the control of street railway fares." The 7-cent fare in Altoona, Pa., has been in effect for several years.

In his answer Mr. Crane referred to the general impression that public utilities are making too much money. He said there seemed to be an idea current that the public utilities had some means of securing money out of the air, so to speak, or that they had some occult means of making a dollar go further than others can. He said that how it could be presumed that the utilities escaped the condition of high cost of living was to be wondered at, for the same condition that confronts the individual also applies to the utilities.

SOME PROPERTIES EXCEPTED

It was his belief that the problem before practically all the street railways of the country was not the question as to when they should reduce the fares, but rather how they could keep on going on the existing rates. He said that the exceptional railways were those so situated in the midst of heavy traffic, well distributed throughout the day, frequent interchange of loadings, relative short hauls, or other advantageous conditions that their present fares supply their needs. The statistics of the industry as a whole, he went on to say, showed that since 1913 the average rate of fare had increased from 4.84 cents to 6.88 cents (44 per cent), while the cost of materials had increased 69 per cent and the rate of wages 114 per cent during that period.

He then went on to give some statistics of his own property. For that same period there had been an increase in labor and material expenses, exclusive of taxes, rentals, interest, and the like, of 91 per cent, against an increase in receipts of 83.9 per cent, partly due as to the latter to an increase of 22.2 per cent in the number of riders. Under peak conditions in the year 1920 the increase in operating expenses was 149 per cent, in receipts 97.9 per cent and in passengers hauled 44.7 per cent.

Still the total increase in fares was only 40 per cent. He said that this status of affairs represented the industry at large.

He said that the increased fare partly covered the situation, but that the major result was obtained by neglecting the property. He meant by that, he said, that expenditures for the maintenance of the physical property were reduced to a minimum and deferred with the hope of more favorable future conditions, which condition has not obtained as yet. It was his contention that the rate of wages on the railways needed no apology, except it was that of being too low, as the industry would have to establish a rate that would attract employees, and it has scarcely done even this.

One of the important problems before the industry was to determine some method by which operating costs could be reduced, not with the idea of reducing the fare, but with the view of making the present fare sufficient for its needs. This method, adopted for the present, was the using of one employee to a car instead of two. He said that his company had within the last year expended close to \$150,000 to improve the power plant by the installation of a new engine and entirely with the view of reducing expenses in that department.

He concluded by saying that the industry recognized the obligations to the public and was endeavoring in every way to meet them, and that when conditions were favorable and justified the public could be assured that the company would do its part.

Ticket Sales in Atlanta Increase

Nearly twice as many persons will invest in tickets when sold at the rate of three for 20 cents as will buy fifteen of them for \$1. This at least is the experience in Atlanta during the past three months. The three-ticket rate mentioned above was put in force on July 1, 1923, by the Georgia Railway & Power Company, supplementing the fifteen-for-\$1 rate in existence for some time. The cash fare in Atlanta is 7 cents. A statement covering passengers carried and tickets sold during nine months in 1922 and 1923 follows:

Month	1922			1923		
	Total Pay Passengers	Tickets	Per Cent	Total Pay Passengers	Tickets	Per Cent
January.....	5,750,310	1,182,415	20.56	5,916,213	1,194,226	20.19

Buses Proposed for District of Columbia

A proposal to parallel the street railway lines of Washington with modern buses, "without interfering with said railroads except by fair competition," was submitted to the District of Columbia Public Utilities Commission by Arthur E. Randle, president of the East Washington Heights Traction Railway, on Oct. 31. Mr. Randle coupled with his proposal an offer to pay the District government, in return for such franchise, 1 cent per passenger carried by the buses, or \$1,000,000 annually.

The proposition, accompanied by a certified check for \$25,000 as an evidence of good faith, was placed before the Public Utilities Commission during consideration by that body of a proposal by the Capital Traction Company to operate a bus from the terminus of one of its lines at Seventeenth Street and Pennsylvania Avenue, Southeast, across the Anacostia River into Randle Highlands. This bus feeder will parallel for some distance the line of the East Washington Heights Traction Railway, of which Mr. Randle is president. The East Washington company operates a single-track suburban line, with two cars in service. Citizens along the line had petitioned for improved service.

The commission granted the Capital Traction Company permission to operate the bus into Randle Highlands on Nov. 1. No action was taken on the offer of Mr. Randle, who did not disclose his associates in the proposition.

Economy to Be Effected in Grand Rapids

In order to keep fares at their present rate, seven rides for 50 cents, the Grand Rapids Railway has found it necessary to discontinue one of its through lines reaching from the northwest city limits through the downtown section to the Wealthy Street carhouse, in the southeast section. This change, according to General Manager Louis J. DeLamar, will save the company approximately \$70,000 a year and will not make it necessary to charge 25 cents for three rides. The only other alternative, he stated, would have been to put all cars on a twelve or fifteen-minute schedule if fares were not to be changed. The abolishment of the through line has necessitated agreement between the railway and the City Commission on three short lines to care for the territory formerly covered. The City Commission at first protested the

plan on the ground that a stub line would not adequately serve the Scribner-Street district, part of the territory covered by the old route.

Mr. DeLamarter, in reference to the change, said that his company during the past four months had carried a half million fewer passengers than during the same period last year and that the changes would not work a hardship on any one.

Refuses Blanket Certificate

The Ohio Public Utilities Commission on Oct. 29 refused to grant the Youngstown Motor Transportation Association a blanket certificate, authorizing its

Drop in Percentage of Transfers Collected

Boston Finds Not So Many Presented Since Time Limit Is More Easily Checked

The effect of placing an easily checked time limit on transfers is to reduce the number presented for passage, according to the experience of the Boston Elevated Railway. That company put the Moran transfer into general use on its system on Jan. 1, 1923, and there has been a reduction to 75.15 per cent in the number of transfers collected to those issued. A table showing the percentages follows:

	Number Issued	Number Collected	Per Cent Collected
Nine years prior to change of style	690,370,933	566,717,149	80.64
January, 1923	6,155,809	4,584,714	74.48
February, 1923	5,637,514	4,223,895	74.92
March, 1923	6,308,957	4,823,486	76.45
April, 1923	5,977,524	4,558,304	76.26
May, 1923	6,363,008	4,859,410	76.37
June, 1923	6,082,908	4,617,582	76.00
July, 1923	5,848,367	4,325,667	73.96
August, 1923	5,673,586	4,205,412	74.12
September, 1923	5,713,382	4,206,156	73.62
Average nine months 1923			75.15

more than 100 jitneys to operate under the new motor bus law. Following the hearing of the protest filed by the Youngstown Municipal Railway, the commission ruled that the association was not entitled to a blanket certificate for all the jitneys because the cars were owned by individuals who were members of the association and not by the organization. Ten days time has been allowed by the commission for the separate jitney owners to file their applications and affidavits for certificates, and each bus will be considered separately.

Charges were made by Ross Raymond, president of the Motor Transportation Association, against Harry Engle, the Youngstown Street Railway Commissioner, charging him with fighting the jitneys persistently and trying to eliminate them as competitors.

A. S. Somers Addresses Chamber of Commerce

In a recent address before the Brooklyn Chamber of Commerce Arthur S. Somers, director of the Brooklyn-Manhattan Transit Corporation, declared that the 5-cent fare was not a fixture in New York. He referred to a statement made at the recent convention of the American Electric Railway Association in Atlantic City that the 5-cent fare was now "virtually extinct." He said he believed that we had seen the last rail laid in the streets of the metropolitan district. He believed that buses under responsible control and direction might be tried, but that the initiative rested with the public.

In summing up the Brooklyn transit situation he said in part:

The city has invested \$162,000,000 in the B. M. T. system alone.

The city has received no return on this investment.

Every private investor who put \$1,000 in the B. R. T. in 1912 has lost \$433.

If all of the passengers who were prevented from using transfers because of the expiration of the time limit paid a cash fare, the additional revenue to the company based upon the operations for the nine months ended Sept. 30, 1923, would amount to \$32,854 per month. If one-half of the passengers walked rather than pay another fare, the additional revenue would have been \$16,427 per month. The present Boston transfer was described in the issue of this paper for July 7, 1923.

Write About Your Courteous Conductor

The Allentown *Chronicle and News* is going to present to the most courteous conductor on the lines of the Lehigh Valley Transit Company two tickets for the Lyric Theater. This procedure will be carried on every week during the winter months. The *Chronicle* believes that there are many polite conductors lurking around who do not receive enough attention for their courteous acts. The newspaper has called upon the public to help in this campaign of looking for the most polite street car conductor.

The public is called upon to write of its experiences with conductors. When some very aged, infirm or otherwise unfortunate individual receives help from a courteous conductor, the public is asked to tell about it in writing, or when some special act of consideration is shown to patrons by a conductor, it is suggested they get his number and the line on which he works, and then write in and tell the newspaper all about it. At the end of the week the editors will check up and determine who is the most deserving and the tickets will be mailed out just as soon as possible after a choice has been made. In the words of the *Chronicle and News*, "Keep us posted."

Trackless Trolley Line Approved.

Following the approval of the Public Service Commission, the Rochester Railways Co-ordinated Bus Lines, Inc., a subsidiary of the New York State Railways, opened crosstown trackless trolley service through Rochester's north end over Driving Park Avenue on Nov. 1. The fare rate is the same as charged by the Rochester trolley lines and transfers are to be exchanged between the trolleys and the new line.

Plans Further Bus Operation.—In a recent statement regarding the present traffic congestion in Philadelphia, the Philadelphia Rapid Transit Company announced that it was planning to operate motor buses, such as are now used on Roosevelt Boulevard, through streets that are not now occupied by the company, or from which existing car tracks could be removed. The company said that there would be no relief on Chestnut and Walnut Streets until the proposed Chestnut Street subway had been built. The statement also referred to the number of cars purchased by the company this year, and how many had been received and assigned to regular service. Reference was made to the trackless trolley operation on Oregon Avenue.

Fare Limit Extended.—The Manhattan & Queens Traction Corporation has established a second fare point at Old Mill Road, Elmhurst, L. I., instead of at Grand Street and Queens Boulevard. This change extends for nearly a mile, the length of the 5-cent ride to and from Manhattan. As a result of the new order, it is possible for passengers to start from points between Grand Street and Old Mill Road and ride for 5 cents to either end of the line.

Rate Hearing Postponed.—Hearing on the rates of the International Railway in Buffalo, scheduled for Oct. 31, before the Public Service Commission at Albany was postponed until Nov. 12 at Buffalo because of inability of witnesses to attend.

Employees' Suggestions in Force.—Valuable suggestions have been received from employees of the Monongahela-West Penn Public Service Company, according to Capt. George M. Alexander, president of the company, as a result of an effort made several weeks ago to have practical pointers submitted by men on the job. These suggestions proved to be the chief subject of discussion at a recent conference of the operating officials of the company and some of them have been put in force.

Want Buses.—The Missouri Public Service Commission on Oct. 31 held a public hearing on the joint application of the city of Nevada, Mo., and the Fort Scott and Nevada Light, Heat & Power Company to substitute motor buses for the railway system in Nevada. Several citizens protested against the proposed plan. Under the proposed change the company would charge the same fare. In its petition it set forth that the car system has been operated at a loss since 1919.

Book Reviews

Kent's Mechanical Engineers' Handbook

By the late William Kent; tenth edition, rewritten by Robert Thurston Kent, editor-in-chief, and a staff of specialists. John Wiley & Sons, Inc., New York, 1923.

In the twenty-eight years that have elapsed since the first edition of "Kent's Handbook" was published, it has become so well known among engineers that little space is needed to describe it, covering as it does all phases of mechanical engineering practice, and such allied subjects as needed by the mechanical engineer. Each edition, however, has been larger than its predecessor until the present volume, consisting of 2,247 pages, is almost 2½ in. thick, even though printed on thin paper. This is some 50 per cent larger than the last edition.

This edition follows the plan adopted in a number of other handbooks, of having the various sections written by specialists. Some thirty-five men well known in their respective fields have assisted the editor-in-chief in this work.

Much of the material in the book has been entirely rewritten to conform with the latest practice. Subjects thus treated include fans and blowers, hydraulic turbines, the steam engine, steam turbines, gas producers, gas engines, oil engines, hoisting and conveying, refrigeration and ice making, heating and ventilation. A considerable amount of other material is included in the handbook for the first time, such subjects including gas turbines, automotive vehicles, aeronautics, industrial furnaces, forge shop, fusion welding and cutting, malleable castings, reinforced concrete and safety engineering. In the sections not included for the first time or entirely rewritten many paragraphs have been thoroughly revised so that the book is abreast of current practice. A complete index of 113 pages is included for use in finding references.

Laminated Springs

By T. H. Sanders, M.I.Mech.E., M.I. and S.I. The Locomotive Publishing Company, Ltd., London; Spon & Chamberlain, New York, N. Y.

This book is a comprehensive treatment of laminated types of springs, particularly for railway service. It is based on a series of articles on "Laminated Railway Springs," which appeared in recent years in the *Locomotive Railway Carriage and Wagon Review*, London.

The first six chapters are taken up with a discussion of the mechanics of the spring, treating it very largely from a practical standpoint. The next four chapters are concerned with stresses in springs, deflections, and formulas dealing with different forms of spring. Chapters 11 to 24 are concerned with the design of springs of various types, this being taken up in considerable detail.

The second part of the book, consisting of chapters 25 to 44, covers the

manufacture of springs. This includes the manufacture of sections of steel, forging and cutting the material, methods of fastening and checking play, hoops and methods of attachment, fittings of hoops and finishing springs.

While the book is written from the British standpoint, considerable space is given to American practice. The book should be useful to railway men or others who are interested in the design of laminated springs.

Retail Prices—1913 to December, 1922

Bulletin No. 334 of the United States Bureau of Labor Statistics. United States Department of Labor, Washington, D. C.

This is a publication in the retail prices and cost of living series of the Bureau of Labor Statistics. It includes detailed tables and charts covering the range of prices of food, coal, gas and dry goods by months over the period included. It should be of value to the electric railway man in connection with wage agreements and similar problems.

Employment Hours and Earnings in Prosperity and Depression

By Willford Isbell King of the staff of the National Bureau of Economic Research, Inc. Published by the Bureau, New York, 1923. 147 pages.

According to the sub-title, this book is the result of an inquiry conducted by the National Bureau of Economic Research with the help of the Bureau of Markets and Crop Estimates and the Bureau of the Census, for the President's conference on unemployment. The work was carried on under the supervision of the committee on unemployment and business cycles, appointed by Secretary Herbert Hoover of the Department of Commerce, who was chairman of the conference. This committee had as its chairman Owen D. Young, chairman of the board of directors General Electric Company.

It was found that there was a surprising dearth of information concerning actual employment conditions in the United States, and the investigation, whose results are recorded in the book, has made a considerable addition to the knowledge of conditions of employment in this country.

Numerous statistical tables are included, giving the number of employees in various industries; the volume of employment, showing the proportion of full-time work by employees in various classes of industry; the hours worked per week; the earnings of employees, both total and per hour or per day.

The statistics collected in the book show the relative responsiveness of different industries to the forces giving rise to the business cycle. It indicates the comparative ability of large and small scale business to resist such forces. Shifts of population from one industrial field to another, and the variations in hours and earnings of em-

ployees of a company as it changes from boom to depression are traced. The approximate total reduction in employment brought about by the depression of 1921 is also estimated.

Railroad Electrification and the Electric Locomotive

By Arthur J. Manson, Westinghouse Electric & Manufacturing Company, Simmons-Boardman Publishing Company, New York, 1923.

A sub-title states that this book is an "outline of principles involved in railroad electrification. A comparison of steam and electric locomotives. History of electrification in United States. Data on electrification in America, Europe and Australia." It originally appeared as a series of articles in the *Railway Electrical Engineer and Railway and Locomotive Engineering*, but has been enlarged upon and rearranged by the author.

The purpose of the book is not very evident. It is quite elementary, the first six chapters being taken up with the simplest laws of the electric circuit, after which five more chapters deal with the general principles of railway motors and their control and the mechanics of traction. This portion constitutes one-fourth of the entire book.

Following this introductory matter the author considers tractive effort in steam and electric locomotives and energy losses incurred by various methods of acceleration and regenerative braking, three chapters being devoted to these subjects. The next eight chapters are mainly descriptive, covering air brakes, contact lines, pantographs, third rail shoes, transformers and auxiliary apparatus, control apparatus, construction of the railway motor, and mechanical design of the electric locomotive. A short chapter on locomotive inspection follows this.

The next five chapters of the book deal with the theoretical solution of typical electrification problems. Introductory to this there is a discussion of the speed-time curve, with an explanation of analytical and graphical methods of calculation. Then a specific problem is taken up in detail, the train sheet being used as a starting point from which the choice of motive power, distribution system and substation location are worked out. The main portion of the book ends with a short discussion of the electrification system of the future and its cost of operation.

An appendix gives brief descriptions of several American electrifications, followed by tabulated data showing the extent, type of system, construction details, power distribution and generation, locomotives and multiple-unit equipment.

The book is not likely to be convincing to the reader. The illustrations from practice seem to have been taken from the work of one manufacturer only, and the question of systems, which has been such an important factor in the past, is greatly subordinated. Its greatest value would seem to be that it has brought together a large amount of data on existing electrifications, which is thus made available for study.

Personal Items

Leon H. Johnson Purchasing Agent in Anderson

Leon H. Johnson has been appointed purchasing agent for the Union Traction Company of Indiana with headquarters at Anderson. He succeeds Hudson R. Biery, who recently accepted the position of assistant to the president with the Indianapolis & Cincinnati Traction Company. Mr. Biery's appointment was referred to in the *ELECTRIC RAILWAY JOURNAL*, issue of Sept. 22.

Mr. Johnson has not been identified with the electric railway business, but brings into it an unusual and valuable store of experience, gained in his association with such concerns as the Toledo Shipbuilding Company of Toledo, Ohio; the Struthers-Wells Company of Warren, Pa., and the Anderson Foundry & Machine Company of Anderson, Ind., serving the latter named concern as general manager. He is a graduate of the University of Michigan, class of 1908, and a member of the Tau Beta Pi.

Supervisor of Accident Prevention in Chicago

Victor T. Noonan, who recently resigned as superintendent of accident prevention for the Cleveland Railway, has been appointed supervisor of accident prevention for the Chicago Surface Lines. Mr. Noonan is one of the pioneer accident prevention engineers of the country and has a national reputation in this work. He was remarkably successful in organizing the accident prevention work of the Cleveland Railway. He was formerly State Director of Industrial Safety for Ohio, holding this position, which was non-political, for six years. Previous to his connection with the Cleveland Railway he was a public consulting accident prevention engineer and had organized accident prevention in some of the largest industries in the United States. Mr. Noonan is the author of five motion picture scenarios on accident prevention. He is a member of the National Safety Council and chairman of the committee on public education of the American Street Railway Section of the National Safety Council.

J. B. Mahan Made Secretary and Treasurer at Schenectady

Another change in the executive staff of the Schenectady Railway has become effective in the naming of J. B. Mahan to the position of secretary and treasurer, succeeding J. H. Aitken, who recently resigned after twenty-one years of service with the company. Mr. Mahan for the past six years has been head of the accounting department of the Terre Haute Traction & Light

Company and was closely connected with E. M. Walker when the latter was connected in an official capacity with the Terre Haute, Indianapolis & Eastern Traction Company before Mr. Walker was made president of the Schenectady Railway. In all, he served the Terre Haute company approximately ten years. He is a native Indian. He went to Schenectady on Nov. 10.

Thomas J. Lynch Had Active Railway Career

Thomas J. Lynch, whose appointment as general manager of the Schenectady Railway was noted in the *ELECTRIC RAILWAY JOURNAL*, issue of Nov. 3, entered upon his railroad career as a clerk in the passenger department of

T. J. Lynch

the Delaware & Hudson Company, Albany, N. Y., filling consecutively various positions in the service of that company in the passenger, freight, traffic, mechanical and transportation departments. He was superintendent of the Susquehanna division with offices at Oneonta, N. Y.; superintendent of Greenwiche & Johnsonville Railway with offices at Greenwich, N. Y.; general agent with offices in New York City; assistant to the vice-president and general manager; and later became assistant to that company's vice-president in charge of the subsidiary properties, including the Hudson Valley Railway, Plattsburg Traction Company, United Traction Company, and the Champlain Transportation Company. In the last-named position he was detailed to special investigations of operating practices effective on various street railways throughout the country, and had the handling of all purchases. Later he became assistant general manager of the United Trac-

tion Company at Troy, N. Y.; and on July 15, 1923, became assistant general manager of the Schenectady Railway. His ability here was soon noted, for in less than four months he was appointed general manager of the Schenectady property, effective Nov. 1.

Mr. Lynch was born at Troy, N. Y., on Jan. 29, 1886. In charge of operation, he succeeds in his new position William S. Hamilton, who was general superintendent.

Francis Tingley, formerly supervisor of overhead lines, Washington Railway & Electric Company, Washington, D. C., has resigned to become a member of the firm of Over & Tingley, to engage in general engineering work in the vicinity of Philadelphia.

J. Alfred Cote has been appointed superintendent of the Quebec Railway, Light, Heat & Power Company. In this position he succeeds J. A. Everell.

C. M. Cheney, vice-president of the Des Moines & Central Iowa Company, Des Moines, Iowa, has been named president and general manager of the Waterloo, Cedar Falls & Northern Railway. He succeeds C. D. and L. S. Cass, who relinquished all their holdings to the bondholders.

D. E. Byerley has been transferred from the Hattiesburg Traction Company, Hattiesburg, Miss., where he served in the capacity of general manager, to Adrian, Mich., to assume the managership of the Lenawee County Gas & Electric Company, a new property purchased by the Doherty Organization. E. E. Armstrong, formerly general superintendent of the Meridian Light & Railway Company, has been transferred to Hattiesburg, filling the position of general manager.

David G. Fisher has resigned as president and director of the Iowa Southern Utilities Company, Centerville, Iowa. He has held the position since 1916, when he organized the corporation with the plants in the vicinity of Leon, Iowa. Mr. Fisher, also president of David G. Fisher & Company, public utility engineers, will devote his time to the development of extensive engineering projects in which he has for some time been interested.

John W. Ryan has resigned as secretary of the Erie County Traction Corporation, Buffalo.

C. M. Broadhurst, formerly with the Niagara, St. Catharines & Toronto Railway, St. Catharines, Ont., has been appointed mechanical superintendent of the Toronto Suburban Railway, Toronto. In this capacity he replaces F. Bazett-Jones, who has been transferred to St. Catharines. Both properties are owned by the Canadian National Railways.

T. L. Beauchamp, formerly district manager of the Alabama Power Company at Decatur, Ala., is now superintendent of the Tuscaloosa Railway & Utilities Company at Tuscaloosa, Ala. The Alabama Power Company recently took control of the railway property.

Volume of Business in Car Building Industry Doubled Since 1909

Although the total number of persons engaged in the business of building electric railway cars was less in 1921 than in 1909, according to figures recently released by the Department of Commerce, nevertheless the total value of the product was nearly double that

sible bidder. The plant must sell for two-thirds of the appraised value. In successive reappraisals the value set on the plant has been reduced from \$3,257,759 to \$1,423,839, its present appraisal value. A bid of \$949,226 may legally be accepted. As representative of the holders of \$2,000,000 in mortgage bonds against the company, the Guaranty Trust Company, New York, is request-

Value added by manufacture.....	6,975,663	6,383,034	4,145,174	3,549,396	9.3	79.8

of the earlier year. The decrease in the number of employees was entirely among the wage earners. The number of salaried workers, on the other hand, showed a marked gain. Moreover, the total sum paid in salaries has steadily advanced, the increase being 43.7 per cent from 1909 to 1919 and 33.2 per cent from 1919 to 1921. Wages increased in the first period, but in the latter two years decreased 22.6 per cent.

Since 1909 the value of the manufactured product has about doubled. The cost of materials was in 1919 nearly triple what it had been ten years earlier, but since that time there has been some reduction. General statistics for the electric railway car building industry are given in the accompanying table.

Barney & Smith Plant Again on Sale

Under an order issued at Dayton by Judge Edward T. Snediker of the Montgomery County Common Pleas Court the Barney & Smith Car Company's plant will again be offered for sale Dec. 5. It is reported that a prospective buyer has been found. The Baltimore & Ohio Railroad is mentioned as the pos-

sible bidder. The plant must sell for two-thirds of the appraised value. In successive reappraisals the value set on the plant has been reduced from \$3,257,759 to \$1,423,839, its present appraisal value. A bid of \$949,226 may legally be accepted. As representative of the holders of \$2,000,000 in mortgage bonds against the company, the Guaranty Trust Company, New York, is request-

Large Shipments Made to Chile

Several unusually large shipments of substation equipment and rolling stock for the Chilean State Railway have been made from the Westinghouse plant at East Pittsburgh. One consignment consisted of six freight locomotives completely crated and packed for the ocean voyage. This was claimed to be the largest single shipment of the kind ever made. Another, consisting of complete equipment for three substations, required for overland transportation thirty-three railroad cars. The aggregate weight amounted to more than 800 tons, and the total value of the equipment was about \$750,000. An interesting feature of this shipment was the fact that the long train, drawn by an electric locomotive, was started by wireless. These consignments are part of a \$7,000,000 order now nearing completion.

Costs Higher on Supplies Manufactured in Railway Shops

One of the larger railways, which had undertaken to manufacture a number of things in its own shops, such as axle and armature bearings, cast-iron brake shoe hangers, door and step mechanisms and other regularly used maintenance supplies, recently checked its costs against the prices of manufacturers for these same articles. This company had found that it had to add 97 per cent to the prime cost of labor and material to cover its overhead expense. Upon submitting specifications on twelve articles, as manufactured in the company's shops, to several manufacturers, the bids received were lower in every case than the company's costs, a fairly sizable quantity having been specified. Needless to say, the company ceased manufacture in its own shops.

The superintendent of equipment said his shop was supplied with machine tools and handling equipment rather better than the average railway shop. The difficulty is that the average shop is equipped with utility tools, which are maintenance tools and not manufacturing tools. A manufacturing plant is supplied with high-speed tools, and the work is organized and the employees are particularly trained in production work. As soon as a manufacturing program is put into the maintenance plant, it takes the mind of the master mechanic off maintenance and onto manufacturing. This equipment man remarks that the two kinds of shop work simply will not mix, and the railway nearly always makes a mistake in trying to manufacture its own supply parts.

This Thirty-three-Car Train Carrying Electrical Equipment for the Chilean State Railway Was Started from East Pittsburgh by Wireless

British and Foreign Prices for Electric Plant

The municipalities of both Leeds and Bradford have appointed committees to consider the fact that the tenders of British firms for electric plants are higher than those of firms on the continent of Europe. The desire of the city councils of course is to give their orders to British firms, and it is hoped to find some way by which the great disparity of prices may be removed. In the meantime, the electricity committees of both towns have accepted tenders from British firms for the supply of large turbo-generators.

London Electric Railway Extension

The first section, about 1½ miles long, of the extension of the Charing Cross & Hampstead Railway from Golder's Green to Hendon is now practically complete. Work is proceeding rapidly on the second section, 3 miles long, from Hendon to Edgware. The extension is mostly on the surface, but there are some tunnels. This work began ten months ago and is well advanced. The total cost of the section from Endon to Edgware, including permanent way, signaling, station buildings, rolling stock, and other works, will be £398,000.

Rolling Stock

Schenectady Railway has ordered one double-truck snow plow, delivery on which will be expected by Nov. 15. The company has overhauled and repaired six sweepers to provide adequate snow removal equipment for the coming winter.

Kansas City Railways, Kansas City, Mo., during the last month has remodeled 190 cars in use on city lines to conform to the safety standards that have been adopted by that company. All the cars have been equipped with automatically closing doors and steps, which are designed to avert accidents and handle the traffic more expeditiously.

Track and Line

San Antonio Public Service Company has been authorized by the City Commission to build an extension on Rulz Street, at an estimated cost of \$24,000.

New York, N. Y.—The Board of Estimate has approved the Transit Commission's request for \$1,725,000 for the extension of the Brooklyn-Manhattan Transit Corporation subway in Fourth Avenue, Brooklyn, to Fort Hamilton.

Honolulu Rapid Transit Company has adopted plans for extensions and improvements to its system involving an expenditure of more than \$300,000, according to H. Stuart Johnson, manager. The residential districts of the city are expanding rapidly and it is stated that the company will make pro-

vision for caring for this traffic more adequately than at present.

New York State Railways, Syracuse, N. Y., has been authorized by the Public Service Commission to extend its line on the Syracuse-Bridgeport highway a distance about 2,000 ft. so as to provide transportation service for employees of an industry soon to be operated in Salina. There was no opposition to the company's petition to exercise a franchise in that town and the commission holds the additional tracks are necessary and convenient for the public.

Muskegon Traction & Lighting Company has been granted permission to make an extension of 1 mile from its present Ottawa Street car line to Getty Avenue.

Columbus Railway, Light & Power Company, Columbus, Ohio, following the court award of \$1,136,310, announced through President Kurtz that there were many improvements and new construction projects that should be carried out. New cars are needed, as the present equipment is not sufficient. The construction of an additional power plant costing approximately \$4,000,000 is contemplated. Extension of car lines into newly built-up property, street improvements, placing of power lines underground and scores of other things must be undertaken in the near future.

Power Houses, Shops and Buildings

Fort Dodge, Des Moines & Southern Railroad, Boone, Iowa, has awarded the contract for the construction of a new brick and concrete carhouse and yard office at Fort Dodge, at a cost of \$150,000, to the W. J. Zitterell Construction Company, Des Moines. The old building, which the concrete is to replace, was recently destroyed by fire.

Olean, Bradford & Salamanca Railway, Olean, N. Y., will use power from Niagara Falls on part of its lines beginning early in December. The system is expected to draw its entire supply of power from the Falls next spring. With the completion of the power system now being installed the Ceres plant is to be closed down, but held as an auxiliary source of power for use in emergency.

Louisville, Ky.—Plans and specifications for the new interurban terminal station for the Louisville Railway Company on the west side of Second Street, between Liberty and Walnut Streets will be mailed out to contractors shortly and bids will be opened and considered about Dec. 1. The estimated cost is \$200,000. The announcement of the bids was recently made by Frank H. Miller, vice-president in charge of engineering and construction for the company.

Tri-City Railway of Illinois will lay 1,500 ft. of track on vacant property at Thirty-fifth Street and Fifth Avenue, Rock Island, where cars from the East

Moline division will be stored. The project will cost approximately \$10,000, Frank Skelley, assistant manager of the railway, announced. The cars will be stored on the company's lot on Thirty-fifth Street until such time as a new carhouse is constructed in Moline. The cars were formerly stored in the carhouse at the foot of Sixteenth Street, Moline.

Trade Notes

The General Railway Signal Company of New York City has filed an amended certificate of incorporation in the office of the Secretary of State at Albany increasing its capital from \$10,000,000 to \$10,500,000. Harris, Beach, Harris & Matson of Rochester, N. Y., are attorneys for the corporation.

Industrial-Utilities Service Bureau is now located at Suite 77, Todd Building, Louisville. A. R. McLean is the principal of the bureau.

Hitchcock & Tinkler, Inc., contractors building the 6-mile Moffat tunnel in Colorado, have ordered from the General Electric Company six electric locomotives, to be used in hauling the debris from the boring of the tunnel. When the tunnel is completed larger electrical locomotives will be used.

General Electric Company, Schenectady, N. Y., announces important rearrangements of certain fields of work within the sales branch involving a change of name of two departments. What has hitherto been known as the lighting department becomes the central station department, and the name of the power and mining department is changed to industrial department.

Transit Equipment Company, New York, N. Y., recently announced through its president, R. W. Marshall, that it would carry a complete line of new and used buses, bus bodies, fare-registering devices and bus accessories, selling exclusively to the electric railway industry. V. C. Ealey is in charge of this branch of the company's business.

New Advertising Literature

American Di-Electrics, Ltd., Brooklyn, N. Y., has issued a pamphlet, describing briefly its principal products, entitled "Electrical Insulation made by Electrical Engineers." This is also known as Price List 123.

Foamite-Childs Corporation, Utica, N. Y., issues the "Industrial Fire Chief" "in the interest of fire protection engineering."

National Tube Company, Pittsburgh, Pa., has issued the "Seven Wonders of Wrought Pipe." With the aid of pictures and descriptive matter the importance of each wonder is shown in its relation to industry as the "seven wonders of the world" are of importance to science and literature.

The Thermal Syndicate, Ltd., New York, N. Y., has issued a 16-page pamphlet on Vitreosil data.

HENRY W. BLAKE and HARRY L. BROWN, Editors

An Opportunity to Expedite Standardization of Car Parts

THE electric railway industry has had before it for a number of years the general subject of standardization. While the industry is generally agreed that this work is extremely important, it has not been so clear that there are several separate and distinct phases of it that must be treated from different angles.

A letter from the Division of Simplified Practice of the Department of Commerce, dealing with one important phase which has not been given much attention, was published on page 744 of the Oct. 27 issue of this paper. It refers particularly to the work of obtaining more uniformity in the many commonly used car parts which usually differ in some small ways as supplied by the different manufacturers or car builders. As expressed by this division of the Department of Commerce its co-operation with the railway industry would be more in the nature of clearing the field so real standardization could be more effectively and expeditiously accomplished. A review of present varieties of any one article or commodity and a determination of the relative demand for each variety usually suggests the elimination of a large number as being superfluous; and then agreement among manufacturers and users of that item to concentrate on the remaining varieties leads directly into the consideration of improved quality, performance and design of standards. Simplification is a necessary preliminary step in the campaign that is essential in order to carry out successfully any standardization program on a property, no matter of what size.

To obtain some concrete illustrations of the magnitude and importance of this subject a survey was recently made in one of the shop storerooms on a large railway property. The conditions on this particular property are far better than the average, due to the fact that the cars have been purchased in comparatively large groups, thus reducing the number of different groups and consequently the number of different sets of parts. In addition an active equipment engineering organization has been engaged for a number of years in a campaign of simplification which has in many instances materially reduced the number of different lots of parts required for purposes of maintaining the cars and equipment.

Even under these very favorable conditions many examples of the needs for simplification were apparent. There were eight different combinations of hand strap hangers and grips; five different types of bell cord pulley supports; a wide range of cupboard catches, latches, register mechanism fittings and hinges of various sizes for cabinets and folding doors; five different lots of rubber insulating bushings for lead outlets in motors, and various designs and sizes of motor lead terminals which required that sixty differ-

ent lots of made-up motor leads be carried in stock. Variations in the size and design of control resistors required eight different lots of mica insulating tubes, twelve lots of mica washers and a large number of different lengths and sizes of rods and frame parts. Many examples of special parts which were required in comparatively small quantities but of many different varieties were found. In most cases these parts must be manufactured to order from samples and the problem of keeping a supply of parts on hand is a serious one. Switches, fuse blocks and boxes for auxiliary circuits were stocked in a large range of varieties. Electric heaters of approximately the same capacity per unit were constructed and rated in so many ways that twenty different types of coils were carried in stock. Even then a still larger variety were being wound to order as required. There were six different sizes and types of truck turnbuckle castings and forty different lots of grab-handle castings. The number of lots of corresponding parts for door and step mechanisms roughly coincided with the number of groups of cars on the property. There were forty different types or sizes of motor and gear case oil box covers, nine types of sand hose supports and an extremely wide variety of seat parts and fittings.

These are merely a few examples illustrating a condition which is rather difficult to visualize. But the above description is only the operating side of the general picture, and is taken in one storeroom supplying only a portion of one property that may be said to represent one of the best situations that could be found. Apply these facts to a property whose cars have been purchased in many small lots and then multiply by the number of different railways and we begin to get a view of the manufacturing side of the picture. The net results of the condition are needlessly high prices for parts, high costs of maintenance, high investment in stores and high expense of stores keeping.

Judging by the success the Division of Simplified Practice has had along these lines in other branches of industry, the JOURNAL believes that the American Electric Railway Engineering Association might well give serious consideration to some plan for securing co-operation of the various interests in the electric railway field.

Maintenance Ideas Should Be Put to Work

TRIPS made about the country by the editors of this paper, visiting many electric railways, disclose great variations in the methods of doing maintenance work of substantially the same character. While all of the practices may produce results that are satisfactory, in so far as they keep the property in fair

operating condition, it is quite noticeable that there is a great difference in the relative efficiency of the various methods. This applies to shop, track and line with about equal emphasis.

The good old term "local conditions" used to be brought forward regularly as an alibi for retaining some backward practice. The term is not heard so frequently now, probably because of the ridicule bestowed upon it. The excuse now used is the lack of money to purchase new and improved shop and construction equipment.

This paper is devoting considerable space, and much thought and effort, to the work of bringing to the attention of maintenance men throughout the industry the best of the methods that have been devised by progressive executives and workmen. Fortunately, many of the methods cost little to install, while they produce excellent results. But of how many of these improvements has your shop taken advantage? And how many maintenance articles have given you ideas for still better methods than those described? And have these ideas been carried out?

It would be well for the maintenance men to check up and see if everything possible has been done to improve the methods in use, keeping in mind that an improvement in the standards of maintenance usually results in an ultimate reduction of costs. In the meantime the transportation department has had the advantage of better tools to work with, and the public, in its turn, undoubtedly has reflected its approval in greater patronage of the cars.

Is Enamel Better than Varnish for the Car Interior?

AN INTERESTING speculation aroused by the exhibits of the paint manufacturers at the recent convention at Atlantic City concerns the value of enamel as a substitute for varnish in repainting of cars. Every electric railway man is familiar with the difficulty of making old and battered woodwork in the car interior fresh and clean looking when the car is renovated. It is a comparatively simple matter to repaint the metal parts, both inside and out, and give them a luster equal to the original appearance when first they came from the car builders. But the problem is not so simple with the woodwork. Inevitably, this becomes dingy with age, battered by the carelessness of trainmen and passengers and otherwise defaced. No matter how carefully the varnish is removed and the new applied, it is impossible to restore the original freshness of the material. Moreover, varnish removal and sandpapering is an expensive process. Many railways simply varnish over whatever dirt is on the wood. In the course of time, by this process, a thick coating of varnish accumulates and acts as a lens to magnify the underlying defacement.

The use of a solid color enamel is being tried to overcome the difficulty. This is in line with the practice on many steam roads, although in the case of their more modern cars, there is likely to be less wood trimming in the interior. That, however, is a minor difference and in no way affects the general principle. By simply smoothing down the surface of the wood and then covering it with a coating of solid color enamel of some dark color, such as maroon, the majority of the blemishes in the woodwork are entirely concealed. In

order to relieve the monotony resulting from the use of a solid color, railways which have adopted this method of repainting the car interior apply a little hand striping and trimming.

It is perhaps too early to reach any definite conclusions of the value of this treatment of defaced woodwork in electric railway cars. So far it has been tried only on a comparatively few properties. But it seems nevertheless that there are a number of advantages in the methods and that it deserves careful consideration when any extensive program of car renovation is contemplated.

Co-ordinating Motor Drives for Efficient Shop Work

ELECTRIC railway shops still furnish many conspicuous illustrations of the obsolete plan of group driving of machine tools. The life and service obtained from many of the motors have been so satisfactory that in many shops the replacement of these with more modern equipment having individual motor drive has lagged far behind the advance of engineering design. Power has often been looked upon by railway shopmen as too cheap a commodity to worry about, and the need of getting along in so many cases with old shops and equipment has also precluded systematic improvement of motor drives.

But repair shops that have modernized their drives have reaped the reward of their progressiveness. Elsewhere in this issue are presented views of individual motor installations in the Chelsea shops of the Eastern Massachusetts Street Railway, and the reader who sees beyond the machine "close-up" in these pictures will be impressed with the general value of independent tool operation. Clearer working spaces, more compact tool areas, increased safety to employees, a lighter shop, more flexible use of tools and power conservation, all follow the banner of the individual motor drive into the zone of more efficient shop service.

One word of caution should be sounded in regard to shop electrification, and this warning is an economic one. New machine tools with motors especially designed for them may prove more economical, production considered, than remodeling the drive for the present tools. Within recent years machine tool and motor manufacturers have been drawing closer together in mutual design work, so that today a wide range of high-grade machine tools admirably equipped electrically is available for great varieties of shop operating. The master mechanic confronted with the problem of modernizing his shop drives will thus do well to study the new designs and costs of available unit tools built for high efficiency service on self-contained motor drive basis.

He may find, in this case or that, lower total costs by adapting existing tools and motors to mutually co-ordinated service; but he is more likely to discover that the economic solution is to buy entirely new equipment. General purpose motors can be applied with much success to constant-speed tool driving, and the skillful use of angle-iron and other metal shapes in making up motor mountings often solves a most difficult appearing problem in tool powering. The whole question of how best to drive shop tools is a very important one and examples like those pictured from Chelsea are full of suggestions that will make their appeal to the discerning mechanical eye.

Machines Facilitate Track Zone Pavement

Distribution of Material to Make Convenient Its Delivery to Concrete Mixer and the Use of Loaders and Tractors Have Helped the Milwaukee Electric Railway & Light Company to Get Good Results in Track Paving and Lower the Cost

THE way and structure department of the Milwaukee Electric Railway & Light Company has been paying particular attention to the development of methods and devices for dispensing with hand labor to the fullest possible extent in track and paving work. A recent improvement in this direction is the application of labor-saving equipment to the track zone paving operation.

With the increasing use of concrete pavement the company made a study to find the most economical scheme of placing the material for the construction. The amount of material necessary for pouring a particular stretch of track is figured out beforehand and the materials are apportioned and placed on the adjoining pavement by means of steel Differential dump cars.

and the tractor proceeds to the sand loader, where it receives its proper measure of sand. Having thus received a charge for a complete mix, the tractor proceeds to the mixer and dumps its load into the elevating skip. A layout of this nature results in the cement being sandwiched between the two heavier materials, eliminating to a great extent the cement dust usually experienced when dumping into the mixer. A 21-cu.ft. motor-driven Chain Belt Company concrete mixer of the latest type, mounted on rubber-tired wheels, is used for preparing the aggregate. The mixture is made fairly dry and is placed on the roadbed by means of a bucket traveling on the mixer boom.

Leaving the mixer, the concrete, which is of 1:2:3½ mix of a dry consistency, is hand-tamped and shoveled

Left—Material Distribution and Equipment Arrangement for Concrete Paving Work in Milwaukee. In the Foreground Is the Crushed Stone and Loader; Beyond the Cement Is Piled; then the Sand and Sand Loader, and in the Background the Concrete Mixer. Right—Truck Tractor Receiving Measure of Gravel at Loader

Alternate piles of sand and gravel are supplied, starting 200 ft. from the mixer, in such quantities that each pile provides sufficient material for 100 ft. of pavement. As an example, a particular stretch of track under construction required 22 yd. of sand, 38 yd. of gravel, 290 bags of cement per 100 ft. and a series of unit supplies of these amounts of materials were placed the entire length of the new construction.

The materials are taken up from the street and placed in measuring hoppers, by means of Barber-Greene loaders, and conveyed from the hoppers to the concrete mixer in Clark 1-yd. capacity truck tractors, two loaders and three truck tractors being used on a job. In order to obtain the proper mix and get the most efficient pick-up of materials the mixer is set nearest the sand pile with its conveyor, while the adjoining gravel pile and its conveyor are a little further away from the mixer, with the cement in sacks piled at convenient intervals along the curb midway between the two conveyors.

The procedure is for a truck tractor first to secure its load of gravel. Cement then is placed on the gravel

into the crevices around the rails and ties. The first layer of concrete is placed to within 2½ in. of the finished top for a distance of about 30 ft. Wire mesh reinforcement is then rolled out into place and the mixer backs up and places the 2½-in. finish surface. The steel tie rods, in general, serve as forms to gage the height of the first level of concrete and act in a way as reinforcing bars, the wire mesh being laid on top of the tie rods. American Steel & Wire Company's 0.058 steel mesh is used for the reinforcement.

The flangeways along the gage side of the rail are formed by laying metal-protected beveled wood strips of the proper shape, which are left in place until the finishing work is well under way. A design is being worked out for a finishing machine which will strike off the concrete, tamp, finish and form the grooves all at the same time. This will still further eliminate hand labor. The curing of the concrete is accomplished by placing a layer of sand over the finished surface and keeping this wet for several days. More recently the company has been trying out the use of a silicate of soda solution for curing, apparently with good results.

Left—Concrete Mixer in Working Position Ready to Receive Charge. Right—Special Forms Used Where Granite Header Blocks Are Employed for Flangeways

The track being laid in Milwaukee is of the rock ballast type, having 8 in. of mechanically tamped rock ballast under the ties and sufficient ballast between ties to bring it up to within $2\frac{1}{2}$ in. of the top surface. A $7\frac{1}{4}$ -in. 102-lb. plain girder rail, Lorain section No. 516, is carried on 6 x 8-in. x 7-ft. hewn yellow pine ties spaced at 24-in. centers. A shoulder tieplate is used and $\frac{3}{4}$ -in. screw spikes. Steel tie rods are placed every 6 ft. and serve to maintain the gage as well as reinforce the concrete. For ordinary street crossings, the 4-in. sloping flangeway provides a not objectionable crossing for vehicular traffic. However, at boulevard intersections a granite header is used which has a 2-in. flangeway cut in one corner the depth of the rail head. Suitable wooden forms are provided in a special case of this kind to prevent the concrete being carried up against the rail. These are constructed of 1-in. material braced every few feet. The rock ballast is excavated a few inches between the ties at the point where the granite header is to be placed in order that a 6-in. thick concrete base may be provided for the header. In the case of a certain boulevard, 150 ft. of granite headers were required per rail. This portion of the work requires an extra amount of time and labor, but is encountered at only a few points in the city.

Thermit welded joints are used, a portable track grinder being used to smooth the surfaces.

In general, the concrete paving gang consists of twenty-three men, including equipment operators, working nine hours per day. Approximately 500 sq.yd. of concrete pavement is laid and finished per day. It is expected, through the substitution of additional equipment as described above, further to reduce the man-hours on this class of work.

The Milwaukee company was at first reluctant to adopt concrete as a substitute for stone blocks for track zone pavement, due to the difficulty of opening up concrete pavement when track repairs are needed. With the development of the use of air tools and air equipment, however, the difficulties of making repairs in concrete pavement became less, so in 1919 the company laid its first experimental sections of concrete pavement. This was found to be satisfactory in every way and met with the approval of the municipal authorities wherever tried out. So the use of concrete pavement has been greatly extended since that time. During the season of 1923 approximately 50,000 sq.yd. will have been laid, forming about 70 per cent of the track zone paving work done by the company in that period. At the end of 1923 about 18 per cent of all track zone pavement in Milwaukee will be concrete.

The company is also laying this year certain experimental sections of pavement finished with the so-called "Vitrolithic" process to test out this pavement in comparison with the reinforced concrete.

Wheel, Gear and Axle Practice—III

**Grinding of Chilled Wheels Done by Pit and Floor Grinders and Abrasive Brakeshoes—
Gaging of Wheels for Wear and Rotundity Important—Proper Inspection
Insures Removal of Axles Before Failures—Axles Are
Straightened by Hot or Cold Processes**

PREVIOUS articles in this series giving information obtained from a survey of the wheel, gear and axle practice in use at sixty representative railway shops were published in the *ELECTRIC RAILWAY JOURNAL* for Aug. 18 and Oct. 27, 1923. Information has been given in regard to mileage obtained, conditions that limit life, methods used to increase mileage, shop arrangement, storage, and method of handling material to and from machines. In this, the third and last article of the survey, the maintenance of chilled iron wheels is discussed, together with maintenance methods and machines used for axle work.

Gaging Wheels in a 300-Ton Hydraulic Wheel Press at the Sullivan Square Shop of the Boston Elevated Railway

OF THE SIXTY electric railways from which information was obtained by personal visits in making this survey, approximately half were using chilled-iron wheels. Ten companies were using both steel and chilled-iron wheels. The most of these used steel wheels in interurban service and iron wheels in city service.

One of the principal differences in shop equipment, where chilled-iron wheels are used exclusively, is that a wheel lathe is not required, as the general practice is to grind the iron wheels. The methods and equipment used for grinding can be divided into three classes: First, where a pit grinder is used; second, where the equipment consists of a floor-type grinder, and third, where wheel-truing brakeshoes are used. In the information collected regarding methods of grinding wheels, the three types were used about equally.

RELATIVE ADVANTAGES OF WHEEL GRINDING METHODS

A canvass was made to obtain information on the relative advantages of the three methods of grinding wheels, and opinions as to when the purchase of a wheel grinder would be warranted. The majority of master mechanics seem to think that on roads having 100 pairs or more of cast-iron wheels the economies obtained would pay interest on the investment in a grinder. Individual opinions varied, however, from a minimum of fifty pairs of wheels to a maximum of 500 pairs. Of course, wheel grinders are obtainable at various prices, depending upon the degree of efficiency, and a selection should be made so as to purchase

a grinder commensurate with the actual requirements of the railway.

Electric railways using wheel-truing brakeshoes are obtaining very beneficial results, particularly where the flat spots are small. The great advantage in their use is that the wheels are ground without removing cars from service. It appears, however, that large flat spots cannot be ground out satisfactorily with this method, and some master mechanics have complained about the attention necessary to compensate for the increased coefficient of friction, lest additional flat spots develop. They also find that wheel-truing brakeshoes do not leave the wheels concentric with the journal and that the method is slow as compared to pit or floor type grinders. Several master mechanics stated that they would not know how to handle the flat wheel situation, particularly in winter months, without the use of these shoes.

The main advantage of the pit grinder as compared with the floor-type grinder lies in the saving of expense in jacking up cars, removing and replacing wheels, and handling wheels in and out of the grinder. There is also a reduction in time that the car is withheld from service. Some of the disadvantages given are that the pit grinder does not produce as satisfactory a job as the floor-type grinder, that the wheel treads are not ground concentric with journals and that the driving machinery is in the way of pit work.

The question of the rigidity of the grinder has quite an important bearing upon the results obtained. Some master mechanics feel that a sufficiently rigid con-

Grinding Out Flat Spots at the Sullivan Square Shop of the Boston Elevated Railway

shells and the top of switch housings, as well as other special trackwork, are very scant. Maximum permissible clearances were determined from a careful study made by all departments concerned, and from this the diameters for wheel removal were specified. In order to simplify the work of checking and seeing that wheels are not allowed to wear beyond these limits, electrical telltales are installed at the head of each track in the three elevated inspection shops. Every car, on entering or leaving the inspection shop, must pass over these telltales. If the predetermined clearances for the motors and gear cases are not present, a bell is automatically rung. As the cars are ordinarily run over the pit made up in trains, the location of the exact part of the particular car which caused the action of the telltale is essential. To accomplish this, the tops of the telltales are whitewashed, and if a motor case strikes the top of this a portion of the whitewash remains on it so as to show readily on inspection.

An engineer of a large company manufacturing car wheels, who considers the gaging of wheels very important, considers the only proper way to gage a wheel is from the throat side of one flange to the back of the mate flange. Where the throat side of the flange is against the head of the outside rail of a curve or a frog, the back of the mate wheel should touch the guard rail.

Novel Type of Pit Grinder. Wheels Are Driven from Motor Located in Pit Through Chain and Sprocket

If wheels are so gaged it is stated that a much better flange can be worked out than can be obtained by gaging from the throat of one wheel to the throat of the mate.

HOLLOW TREADS ARE OBJECTIONABLE

In gaging wheels some roads have a practice of measuring the amount that the wheel is worn hollow, but this practice is not very generally used. The reason for measuring the hollow wear is that when a wheel is sufficiently worn to allow the rim to project below the top of the rail, it is likely to receive blows from frogs and crossings. When the flange becomes so high that the apex is likely to strike the bottom of flangeways, it should be removed from service. Wheels that are excessively hollow are likely to damage tracks and crossings on account of the overhanging rim and of the high flange, which causes excessive pounding and rapid deterioration of the track at these points. Hollow wear is usually caused by running wheels which are wider than the top of the rail. Of course, if the rail were wide enough to cover the whole wheel tread, the wear should continue evenly.

In regard to the amount that a wheel can be worn hollow, the M.C.B. Association proceedings for 1905 recommend that wheels be allowed to wear down $\frac{3}{8}$ in. before they are condemned unless worn through the chill. Wheels originally having the ordinary taper can be worn $\frac{3}{8}$ in. from the original contour at the throat before they can become worn $\frac{3}{8}$ in. hollow. It is also evident that if the rim wears down, a total of more than $\frac{3}{8}$ in. can be secured before the wheel is worn sufficiently to condemn it. It is also possible to modify the taper and especially the drop-off taper in such a manner that more than $\frac{3}{8}$ in. wear can be secured before the wheel is $\frac{3}{8}$ in. hollow.

A peculiar case of trouble from wheels wearing hollow was noted on one electric railway some time ago. This company used T-rails in open track construction, and laminated bonds soldered to the rail head were installed. Only a short time after the bonding was completed it was found that nearly all of the bonds were torn off or loosened. Investigation showed that this was caused by a wheel operating over the line whose tread was worn concave to such an extent that its outside portion struck the tops of the bonds and broke them off so that replacement was necessary.

RAILWAY AXLE PRACTICE

One of the chief problems in connection with electric railway axles is to determine when they have reached the end of their useful life. The principal reasons for removal are excessive wear and the occurrence of cracks or breaks. A few electric railways that are operating high-speed service are removing axles after they have reached a certain mileage limit regardless of appearance on inspection, experience having shown that axle breakage is most frequent after this point has been reached.

The British Columbia Electric Railway, Vancouver, B. C., has a practice of scrapping all axles when they have been in service for 250,000 miles. This company finds that proper inspection and tests for flaws or cracks cannot be made without removing the wheels expressly for that purpose. An epidemic of axle failures last year was traced to some tight gage track. This narrowing of the gage was caused by the swelling of wood

Pit Wheel Grinder Used in the Shop of the Des Moines City Railway

block paving on a bridge over which the cars operated. New axles are now being provided with reinforced wheel seats, and it is expected that a considerable improvement will result. Experiments made by this company with nickel-steel axles did not produce good results, although this steel had a higher tensile strength. It did not resist the effect of fatigue as well as the heat-treated axle ordinarily used. Many axle breaks were found to start at the corner of the keyway at the base of the drilled hole made to start the keyway cut. This has led to a change in the practice of cutting keyways, so that they are now milled at the end instead of being drilled.

The Puget Sound Electric Railway, Tacoma, Wash., stamps on the end of each axle the date that it is placed in service. After four years of service, all interurban axles are removed and annealed, regardless of the mileage which they have made. Careful inspection is made of wear and tests are made for flaws. Most of the broken axles on this system have occurred close to the wheel. The fillet at this point is tested for flaws or cracks by gouging up a groove in the fillet with a small diamond pointed chisel. If it traverses a flaw a square chip will be thrown off.

On the Portland Railway, Light & Power Company, Portland, Ore., when axle cracks are discovered in an incipient stage by a test, an attempt is made to turn the axle down below the depth of the crack. If this proves feasible, the roughly turned axle is annealed

Rolling an Axle Bearing Fit on Shaft in the Shop of the Chicago, Lake Shore & South Bend Railway

and is afterward finished by further turning to a smaller diameter.

Many electric railways specify a wear allowance, and axles are either scrapped or turned down to smaller diameters when this wear has been reached. Twenty railways reported using this system, the wear allowances varying from $\frac{1}{8}$ in. to $\frac{1}{2}$ in. of diameter of bearing fit. An accompanying illustration shows the form of instructions which are sent to shops in Brooklyn for scrapping axles or removal for turning to smaller sizes.

Several electric railways report that they are following the rules of the Master Car Builders' Association. Rule 22 requires that axles broken or having seamy or pitted journals, fillets in the back shoulder worn out, or collars broken off or worn to $\frac{1}{2}$ in. or less, should be removed. Rule 23 prescribes limit of wear for different sized axles, and rule 24 provides for the removal of axles with cut journals, bent axles, or axles rendered unsafe by unfair usage, derailment or accident.

ROUGH MACHINING CAUSES AXLE FAILURES

Axles are usually received in the rough state from the manufacturers and are finish-turned in the railway company's shops. Careful machining is most essential, as many failures have been traced to bad machining. The radii of fillets should be maintained accurately, as a sharp corner or tool marks may defeat all the care used in the design and preparation of the axle. A roughly turned axle may be compared to a threaded bolt, the length and thickness of the thread being dependent upon the cut and speed used in the lathe operation. The lathe tool shears small particles of the material, so that a turned axle is in reality a sheared surface, from which small particles of steel have been torn away. Small gaps in the material are caused by the edges of the tool pushing away the layer of steel. When the distorted steel breaks, additional gaps are formed. These gaps lie along the axle, and in general across the direction in which the axle will be bent in service. The grooves lie in the direct line in which fracture is most likely to occur under working stress. Car axles, to give the best service, should have smoothly ground surfaces and be free from sharp angles and accidental notches or dents. Most electric railways know that the manufacturer is not responsible for all the ills which may occur to an axle, that careful machining after it is received is quite essential, and finally that periodical inspection of axles in service is most important.

TESTING AXLES FOR CRACKS

The general practice used by electric railways in testing axles for cracks is first to place the axle in a lathe and rotate it so that its trueness can be determined. After this a hammer test of some form is quite generally applied.

The test used by the Connecticut Company consists of painting the axle with a coat of black lead and oil over the entire surface. The axle is then wiped clean and again painted with a coat of white lead and oil, after which the axle is struck with an 8-lb. sledge on each end. If there are cracks, flaws, breaks or other defects the oil and black lead will show through the white paint. A large number of railways reported as using practically this same test except that the first coat of black lead and oil is omitted. Others report that if the axle is carefully cleaned and then struck several

sharp blows on the ends with a sledge, the oil which remains in any cracks will be forced out and thus indicate the position of the crack. In this latter case no painting of the axle is done.

One railway reports a method of testing axles without removing the wheels. This consists of immersing the axle with wheels mounted in a tank of hot oil. After removal, the oil is carefully wiped off, and the axle is covered with whiting. The axle is then supported on a block at the center with the wheels hanging free, and is struck several blows with a heavy sledge. Wherever there is a crack, a fine thread of oil works up from the crack under the vibration, and can be seen against the white. Several roads report that they clean axles very carefully and then go over them with a magnifying glass.

A test used by the Empire State Railroad Corporation, Syracuse, N. Y., consists of taking a very fine cut with a sharp lathe tool over the section where the crack is most likely to develop. If the axle has a crack, it is then apparent to the operator.

In discussing with master mechanics the question of what might be considered as a safe operating maximum mileage, opinions vary, depending upon service conditions, from 500,000 to 900,000 miles.

HOT OR COLD STRAIGHTENING OF AXLES AN OPEN QUESTION

The controversy as to whether it is best to straighten axles cold or heat them is a very active one, and the information collected in this survey indicates that opinions are about equally divided. There is no doubt that if axles are but slightly sprung, the best method is to straighten them cold, as this can be accomplished quite successfully with a proper axle straightening machine, and there is no danger of destroying the original properties of the steel through heat. Many railways find that mild heating does not injure the original properties to any great extent, and if cooled properly, that satisfactory results will be obtained.

The practice in Brooklyn is to straighten slightly bent axles cold, as it is believed that while the straightening process will cause further distortion of the fiber of the material and so tend to weaken the axle, there is probably less danger from this source than from heating, especially in the case of cold-rolled or heat-treated material, and where proper facilities are not available for re-treating the axle, so as to retain its original properties. The heating of axles of quenched, tempered, and cold-rolled material will affect the physical properties in amounts depending upon the degree of temperature and the rate of cooling. If heated above the critical point of the steel, about 700 deg. C., and then allowed to cool slowly, the result will be materially to reduce the strength with a slight increase in ductility. Annealed axles may be heated to the original annealing temperature, without seriously affecting the physical properties, provided care is taken in the heating and cooling processes.

F. R. Phillips, Pittsburgh, considers it the best practice to straighten axles cold, provided the straightening process does not require more than 10 tons pressure for a 5-in. axle. Heating of axles as usually carried out will change the original physical properties, and if it is necessary to heat cold-rolled or annealed, quenched and tempered axles to straighten them, they should be then restored by re-rolling, re-annealing,

Type of Wheel Gage Used by the Waterloo, Cedar Falls & Northern Railway

and re-treating, as the case may require, in accordance with the methods originally specified for this treatment.

Many railways follow the practice of straightening cold axles, which are bent only slightly, but when out of true to such an extent that this method cannot be done readily the axles are turned down to smaller sizes, or else scrapped.

The Portland Railway, Light & Power Company has had successful results from heating axles for straightening. It is considered better by this company to heat the axles to such an extent that there would be no danger of damage, taking particular care not to overheat them.

WELDING OF AXLES REGARDED WITH SUSPICION

The question as to whether it is advantageous to build up wheel, gear and bearing fits on axles by welding is another one on which there is considerable difference of opinion. Several railways have experienced trouble from breaking of the axles after they were built up, so that this practice has now been discontinued. Others apparently are obtaining quite satisfactory results. Where welding is practiced, the most general custom appears to be to lay the metal on longitudinally. In the shops of the Spokane United Railways bearing fits are built up. The metal is laid on longitudinally by covering first one-quarter of the circumference and then turning the axle 180 deg., where another weld is made. The axle is then turned back 90

Turning an Axle in the Shop of the Columbus Railway, Power & Light Company, Columbus, Ohio

deg., so as to fill in between the two layers, and finally the fourth quarter is filled in.

The Connecticut Company has built up axles to a limited degree, but has found that this seemed to make the material more brittle. Probably this condition is in part due to the fact that the metal is already somewhat fatigued. The company finds that there is no great economy in the practice, even if it proved mechanically desirable.

FINISHING BEARING SURFACES

Careful finishing of the bearing surfaces of axles has much to do with keeping bearing troubles to a minimum. The two principal methods used in electric railway shops, after the bearings are turned in a lathe, are to file and then polish with emery cloth and oil, and to roll the surface with a steel roller. Several roads report a considerable reduction in hot bearings after changing from the use of emery paper for polishing to the use of the rolling method. When finishing with a roller after the last finishing cut is taken on the bearing surface, the rolling tool is substituted in the lathe tool post for the cutting tool. The roller most commonly used is of about 2½ in. diameter and has either a flat or rounded face. Where a flat face is used, it is common practice to round off the corners. The roller is forced up against the bearing surface of the axle by means of the cross-feed screw of the lathe carriage and is run back and forth over the surface as it rotates, by using the regular lathe feed. In passing over the surface of the axle, the roller compresses the metal ridges left by the cutting tool and leaves a smooth, polished surface.

Loose gears are almost unheard of, now that railways are using the solid type. There are, however, quite a number of split gears still in use. The general tendency is also to press gears on axles without keys, although about half of the properties from which information was obtained still use keys with their gears. The pressure used for pressing on gears ranges from 15 tons to 80 tons, with the great majority of roads using approximately 50 tons. Many railways specify a pressure for pressing on gears in proportion to the diameter of the bore. This ranges from 4½ tons per inch diameter up to 10 tons per inch. For the convenience of the shop men many railways have prepared charts of pressures for pressing on in proportion to the diameter of the axle. For example, the Puget Sound Electric Railway, Tacoma, Wash., keeps the pressures within the following specified limits: for 3½-in. axles, 30 to 40 tons; 4-in. axles, 35 to 45 tons; 4½-in. axles, 40 to 50 tons; 5-in. axles, 45 to 55 tons; 5½-in. axles, 45 to 60 tons; 6-in. axles, 50 to 65 tons. It is stated that danger of springing axles is avoided when the pressures are kept within these limits.

The question as to whether the finished diameters for the gear fits of axles and the finished bores of axles could be specified was discussed with operating men on several properties. Most of them seemed to feel that it would be safer to continue the practice of specifying the pressures at which gears should be pressed on, although some felt that diameters of bore with tolerances could be worked out which would be satisfactory. The Kentucky Traction & Terminal Company, Lexington, Ky., has been using for its gears 0.001 in. under size bore per inch of diameter, to allow for press fit, and has been obtaining very uniform pressure for pressing gears on.

Enameled Signs Prove to Be Economical

THE use of enameled signs to mark trolley stations, section insulators, private rights-of-way has proved to be so satisfactory in Brooklyn that no other type is now used. It was formerly the practice to designate stops, etc., by painted signs of wood or sheet iron. A number of years ago it was decided to try enameled signs. While such signs cost a little more in the first place than painted signs, they last so much longer that they are more economical in the end. Paint will wear off a painted sign or become dimmed by weather or dirt in a few years, whereas the enameled sign will last indefinitely unless it is subjected to some severe blow, such as that from a wild trolley pole, which chips off the enamel.

When the sign becomes so dirty that the lettering begins to appear faint, it is an easy matter to wipe it off with a rag soaked in kerosene and restore the original freshness. Where a large enameled sign is attached to a tubular steel pole or to a column of the elevated railway structure, it is slipped into an iron frame, and to prevent the wear that might occur between the sign and its frame, thin pieces of rubber are placed between the two surfaces.

Cold Paving Patch Saves Money

ALTHOUGH the Beaver Valley Traction Company, New Brighton, Pa., first tried the use of a cold paving patch with the idea that it was only a temporary expedient, it has proved so satisfactory that the company is now using this method widely in New Brighton, Rochester and Freedom. Throughout this territory brick paving predominates, and small repairs often entailed considerable expense when it was necessary to take up the old brick. With the cold patch method none of the old brick is taken up. Limestone, sand and oil are prepared in a concrete mixer and hauled to the desired location, where the patch is made without any interruption to traffic. The oils used have been Tarvia and Texaco and both have given satisfactory results.

COST OF PREPARATION AND INSTALLATION OF COLD PATCH FOR PAVING REPAIRS

Material		
1 ton limestone.....	\$2.30	
1 ton sand.....	0.30	
Tarvia, 16 gal. at 20 cents.....	3.20	
Gasoline.....	0.15	\$5.95
Mixing		
Labor, fifteen hours at 45 cents.....	6.75	
Supervision, five hours.....	4.50	11.25
Installation		
Labor, forty hours at 45 cents.....	18.00	
Supervision, twenty hours.....	18.00	36.00
Grand total.....		\$53.20

One cubic yard of material will cover approximately 66½ square yards. This is at the rate of 80 cents per yard.

The estimated cost is about 80 cents per square yard, as shown in the accompanying table. Vehicles are not closed off at any time, but are allowed to run over the cold patch as soon as it has been installed. No detrimental effect has been noticed from this practice.

The various communities through which the railway operates have expressed their approval of this method of repairing the pavement and have been agreeable to the extension of its use rather than urging more permanent repairs. The accompanying figures show the cost of this kind of patching.

Car Mileage Records with a Posting Machine

A NEW method of determining individual car mileage has been developed by the Toronto Transportation Commission, making use of a Burroughs posting machine, the addition and printing being done automatically. The use of this method has simplified greatly the detailed work of obtaining individual or group car mileage records, and the distance covered by the equipment

between any two dates is obtained merely by subtracting the cumulative figures. The results also are applicable to determine the mileage of all parts of the equipment, such as motors, gears and pinions.

The following description outlines in detail the method employed in obtaining the original data and in working it up to give the final record. The system has been developed under the supervision of W. R. McRae, superintendent of rolling stock.

The mileage of the individual car is based on the route schedule, which is of standard form, giving the run for each crew and the corresponding trips and mileage for the day's work. The car assigned to each run is listed on the "Daily Record of Cars in Service," Form D-63 (No. 5 in the illustration on page 856), by a clerk at the carhouse. Spaces are provided on this form so that if more than one car is assigned to a run, as for instance happens when it is broken into several sections that cover parts of the day only, the full information will be recorded. It will be noticed that for the Yonge Street line several car numbers are shown for each run number. This is because the motor cars, which are in service all day, have trailers attached to them during the rush hours.

The information of the daily record of cars in service is confirmed by the "Motorman's Signing-in Sheet," Form D-35. On this the motorman at the end of his work records the run number, car number, time in and condition of the car. In case a car has to be replaced during the run, this information is recorded for the division on Form D-22, "Car Change" (No. 2 in the illustration), on which the route, run number, time and cause of the change are given, in addition to the numbers of the cars involved.

The next form is the first one which is distinctive to this method of calculating car mileage, those already described being similar to forms used elsewhere. This form, X-3, known as the "Daily Record of Cars and Wheel Mileage," both sides of which are reproduced on page 857, is made out in the offices of the divisional superintendents, the run number, car number, time out, time in, miles lost and miles run being entered. The distinctive feature of this form is that the thirty sections on the sheet are separated by perforations so that they may be detached individually. Each

Plan Adopted in Toronto Based on Use of a Bookkeeping Machine Gives Cumulative Mileage for Each Car and Group—Original Records Made on Perforated Sheets Are Torn Apart and Assembled by Car Numbers to Get Individual Records—Wheel, Axle, Motor and Gear Mileage Also Obtained—One Machine Posts Records for 970 Cars Within One Day's Time

section bears a code letter in its lower left-hand corner which indicates the division. When the form is filled out each of the sections will contain a car number with the other information for determining mileage. In case of a change-off a new ticket is filled out for the car making the change, thus giving a ticket for each individual car on every run. In the event of error it is neces-

sary to know not only the division but the route and date, so that each section of the form is marked on the back with a number in Roman numerals, representing the route, and the date in Arabic numerals. This is done easily and quickly by means of roller self-inking rubber stamps.

Passenger cars are divided into groups according to type and equipment. Service cars, motor buses and trolley buses are similarly separated into groups. The sections of the form are separated on the perforations and are sorted according to car number, then being made up into bundles, each of which has car numbers corresponding to a single group of cars.

From the above it is seen that the tickets contain all the information necessary for the record, consisting of the date, division, route, run number, car number, time out, time in, miles lost and miles run.

Accompanying the "Daily Record of Cars and Wheel Mileage" is the "Daily Mileage Report," Form D-10, on which route mileage and divisional mileage are reported. This is made up from the scheduled mileage, by adding the miles for extra cars or trips not scheduled, and subtracting mileage lost.

THE MILEAGE CALCULATION IS MADE BY MACHINE

The mileage shown on the small slips is then posted on the "Daily Mileage Record," Form X-4 (No. 3), by a Burroughs type 2406 split-platen posting machine with an automatic carriage. In order to facilitate the operation, the sheet for the previous day and the sheet to be posted are placed together in the machine, so that the column headed "total miles to date" on the record for the previous day shows to the right of the new sheet. This simplifies the work of transferring the amounts from one sheet to the other and minimizes the chance for error. When an error is made it may be detected easily by comparison and by checking the sheet totals.

The daily mileage record for the entire system is placed on thirty-five of the sheets. The car numbers are printed in the right-hand column, being segregated by groups of equipment. Group L, for instance, consists of forty cars, numbered from 2500 to 2578, which are all of the same type and are all equipped with English Electric DK-83 motors.

Some of the Principal Forms Used in Toronto Mileage Record System

No. 4—The route mileage is furnished by the division superintendent, with scheduled mileage and variations therefrom to give the actual car miles run for the day.

No. 5—The daily record of cars in service is made up from information on the time table.

Individual Cards Give Records of Mileage of Various Parts of Equipment

The total miles run by Group L is shown at the bot-

The daily mileage records are filed on post binders and are handy for reference, so that information can be taken off from them with little difficulty.

During the month of July, with approximately 970 cars in operation, there were 43,555 entries of mileage, giving a total of 2,297,558.79 miles. Working a forty-four-hour week, 223 entries per hour had to be made. This was accomplished easily using only a single machine.

This system is useful to get the mileage record of any group of cars, and gives the mileage history of

[illegible]

Individual Car Mileage for Each Run or Part Is Indicated in One of the Blocks of This Perforated Sheet

The mileage of any car from one given date to another is the difference between the amounts shown on these dates opposite the car number, except in case of a period which extends beyond the first of the year, in

Individual mileage records are kept for various parts of the equipment on 3x5-in. cards. Since the car mileage is kept by the posting machine, it is only necessary to record mileage of the parts when they are subject to change from the car. Mileage records are given for wheels, compressors, motors, armatures, axles, gears and pinions. In addition to the information shown on the faces of the cards, those for compressors, motors and armatures have spaces on the reverse sides for a record of repairs, columns being provided for report number, date, description and cost. These forms are reproduced on page 856.

Individual Motor Mounting Improves Shop Drives

THE illustrations on this and the following page show what can be done in the way of improving motor drives by adapting the mounting of individual units to existing tools, and also, in one or two cases, the convenience with which motors can sometimes be located directly upon or below the machines driven.

In some quarters the use of "home-made" motor mountings has been criticised as not representing the latest thought of the electric motor and machine tool maker. This however, would be a poor reason for failing to improve old-established drives at low relative cost in shops where it is an advantage to get rid of long lines of shafting, oily drips, excessive belt friction, and poor power factor due to running motors unloaded or lightly loaded for long periods.

The machine tool drives that are described in this article are installed in the Washington Avenue, Chelsea, shops of the Eastern Massachusetts Street Railway.

No. 1. The motor-driven circular saw at cutting-up bench has a 3-hp. induction motor mounted in a swinging yoke above the bench, with compact belt drive to the circular saw pulley. A counterweight drops the motor and saw out of the way when not in action, and a conveniently located starting switch on the wall at the operator's left provides easy control of the service. The arc through which the motor travels is so small as to cause no trouble from wiring distortion when the machine is run.

No. 2. Driving a cutting-up saw by a 5-hp. motor mounted on the shop floor below the working surface of the tool. In this case a speed reduction was required and easily obtained by belting the motor pulley to a short jackshaft under the table, with concealed drive by belt to the pulley on the saw shaft. The motor occupies no otherwise useful space, and because the space on and

above the table is needed for working the material effectively, the starting switch was located on a post at the right of the table, not shown in the photograph, but within a step of the working position.

No. 3. Here is a bandsaw gear-driven by a 5-hp. motor mounted on a floor pedestal of concrete at the side of the saw frame, with intermediate gear box. The motor service is brought through the floor by means of rigid conduit, and the gearing is protected by a thin but effective metal housing. A starting box on the adjacent post provides quick and easy control. In this case the disadvantage of being obliged to mount the motor on the floor at the side of the tool is considerably lessened by the use of the very compact gear drive and by the location of the motor out of the line of travel of workmen.

No. 4. Pony planer drive by belting from 5-hp. motor mounted on bracket platform about 12 ft. above shop floor. Here the motor is entirely out of the way even in handling long pieces of board; the wiring is direct in rigid conduit with convenient starting and stopping switch with push-button stop attachment on the post at the rear of the machine. The location of the single belt drive at the side of the tool frees the space around the working table for handling stock, and a close-up view of the motor mounting, which is unusually thorough for an overhead job on the side of a post, is shown in the next illustration, No. 5.

No. 5. Close-up of motor mounting for driving pony planer from post. The motor, a 5-hp. machine running on 220-volt service, is bolted to two 2-in. x 9-in. timbers carried on 4-in. x 5-in. sills resting on a 2½-in. x 12-in. extension piece attached to the post by bolts as shown. The bolts are ¾-in. diameter. Strap-iron pieces as shown reinforce the ends of the improvised platform, and right-angled bracing in the form of a tie-rod from above

and a horizontal stiffener piece from the left are used.

No. 6. Lathe driven by 2-hp. motor mounted on wall-bracket directly over tool and with starting switch and fuses between motor and tool. Space was readily available here for belting the motor to an overhead shaft and pulleys from which a flexible down-drive to the lathe could be had. While many self-contained lathe-motor combinations are now available for shop service, the arrangement shown was put into use at moderate expense, takes up little room useful otherwise and provides an effective and economical drive.

No. 7. Simple and convenient drive of buzz planer by overhead 5-hp. motor. Directly behind is a self-contained motor-driven mortising machine, the 3-hp. unit required being mounted on top of the frame, and at the rear, left, is shown a vertical drill with overhead mounted motor. The absence of overhead line shafting and belting complications is a convenience in material handling. The planer motor is mounted simply on a 2½-in. x 16-in. plank bolted to the post.

No. 8. An irregular molder individually driven by a 5-hp. motor located beneath the working table. Here the drive is extremely simple, with the motor bolted to the under side of the table and served by a short vertical run of rigid conduit brought up from the floor to the terminal cap on the motor frame. The drive is out of the way and yet the motor is readily accessible for inspection or repairs.

No. 9. Close-up of drill press and overhead mounted motor shown in No. 7. The motor, a 3-hp. direct-current unit, is carried on a platform supported on a ¾-in. x 1½-in. strap bracket carrying 1½-in. x 5-in. planks to which the motor base is attached. The belt driving is at the rear and thus out of the way of the workmen.

The drives shown herewith were worked out under the direction of W. C. Bolt, superintendent, and H. S. Wray, assistant superintendent of rolling stock and shops, Eastern Massachusetts Street Railway, Boston.

Since the Eastern Massachusetts Street Railway had available both alternating current and direct current at the Washington Avenue shop, it was possible to select the type of drive best suited for each machine tool. While in general the most convenient system of power supply is direct current, motor manufacturers recommend the use of alternating-current induction motors for constant-speed machines where possible, with direct current for machines that must run at variable speeds or have heavy starting conditions.

The wide variety of machines illustrated in this article shows the adaptability of the motor drive to a number of different conditions such as exist in most electric railway shops. Where the electric installation is designed as a part of a new machine tool, speed changes may be provided by means of gears built as an integral part of the machine. This allows a constant-speed motor to be employed, but to obtain the speed increments necessary with a direct-current adjustable-speed motor requires abnormal gear combinations. Very often a single gear change is used with an adjustable-speed direct-current motor to obtain a wide speed range.

The comparative freedom of the Washington Avenue shops, as rearranged, from overhead shafting and belting is not shown in the illustrations. Where new machinery with individual motor drive is installed, it is, of course, possible to eliminate the shafting and belting. In this case, however, the shafting had been removed from the machines on which individual motor drive was installed, but long belts were necessary where the motors were placed overhead.

Reconstructed Cars for Open Air Line

A DEMONSTRATION run with a train of four reconstructed Manhattan elevated cars was given on the Second Avenue line in New York on Nov. 7, as mentioned in the news columns of this paper in the issue of Nov. 10. The reconstructed cars have vestibuled platforms, with sliding doors in place of the old platform gates and railings. The sliding doors are of sheet steel construction with two panels, one with glass and the other closed. The doors slide on the outside of the car. This construction is of particular advantage as a pocket does not have to be provided inside, which would otherwise disturb the interior equipment. The motorman's operating cab is still retained in its original position just back of the platform.

The sliding doors are electro-pneumatically operated by door engines installed under the longitudinal seats at the ends of the car. The control of these door engines is by control switches installed on the ends of the car. The operator's station is on two elevated footrests between the two cars. By having a train line control cable, multiple operation of the doors is provided, so that one operator can control the doors on as many cars as found advisable. Cut-out switches for the door control lines are installed inside the cars, so that the control connections can be dead-ended at the operator's station or connected through to the next car as desired. Indicating signal lamps are installed at the center of each car on the outside. The circuit for these signal lights passes through both the door contacts and the door-locking contacts, so that it is necessary to have the doors both closed and locked before the lights are extinguished to indicate that the train is ready to start. The motorman's cab is also equipped with a starting signal, which lights when all doors are properly closed and locked. The locking of the doors is accomplished by a small projecting stirrup, which is pulled in when the doors are unlocked and is extended for the locking position.

Provision is made for the emergency opening of doors by a glass-inclosed mechanism at each end of the car. The glass is lettered "To Open Door in Emergency, Break Glass and Pull Weight." The pulling of the weight raises the operating arm of the door engine beyond its center so that the door can be readily pushed back. Similar emergency operating equipment is provided on the outside of the cars as well. These are

intended for use of platform attendants and hooks for the emergency operation are kept at each station. The first test train had ventilators installed on the roof over the vestibule portions of the car. It has not been definitely decided whether all future cars will be so equipped or not. The cars remodeled have been thoroughly overhauled and painted and varnished on the outside with the new standard color goldenrod orange. The inside has also been renovated and painted. The lower woodwork is finished in mahogany and the ceilings in white enamel to improve the lighting conditions.

Sign Tells How Many Windows to Open

IN ORDER to insure uniformity in regard to the number of windows open in the cars, the New York Railways has installed a changeable sign in the inspector's shanty at the West Twenty-third Street and Eleventh Avenue carhouse.

The sign is lettered in black on a white board in the shanty window on the Twenty-third Street side, where it can readily be seen by all passing cars. It reads, "Windows Each Side All Down," as shown in the accompanying illustration. The fourth word is not permanently lettered on the sign, but is on a second board behind the main sign and is read through an opening therein. The rear board

Sign in Window of Inspector's Shanty Gives Instructions as to Windows

rotates and the word appearing through the opening may be changed at will to read "one," "two," "three," etc., or "all."

The windows of the cars of the New York Railways are of the drop sash type, so that having the windows down means having them open. The device is somewhat similar to those whose object is to control the use of electric heat on the cars. Such arrangements have already been described in the *ELECTRIC RAILWAY JOURNAL*, but they are useful only during parts of the year, while the instruction board telling the conductor how many windows to open is useful throughout the entire twelve months.

Train of Remodeled Cars with Doors Closed Ready to Start

N. & W. Line Trouble Record Analyzed

Total Period of Interruptions to Traffic Chargeable to Electric Equipment and Transmission in 1922 Was About Sixty Hours—During Entire Month of March No Line Trouble Was Reported—Pantograph Proved to Be Most Liable to Injury of All Parts of Electric System

THE log of line troubles for 1922 compiled by the electric traction department of the Norfolk & Western Railway, reproduced herewith, shows that most of these are of a trifling nature, a relatively small number causing any interruption to traffic. The electric traction department requires that all defects be reported, hence the table contains many that may seem trifling, but these are included for completeness.

In compiling the records the total delay caused is included. If, for instance, an insulator flashover causes a power interruption of thirty minutes, the delay shown is equal to the number of locomotives delayed multiplied by thirty minutes. The delay, therefore, does not mean the length of time the line was out of service. For example, on June 4 a wooden pole gave way on one of the mine outlet tracks, causing the trolley wires to get out of line and wrecking a pantograph on locomotive No. 2,505. Power was off this section from 5:02 p.m. to 5:44 p.m., or forty-two minutes. As a result locomotives No. 2,507, No. 2,505 and No. 2,502 were each delayed forty minutes, and No. 2,500 was delayed twenty-five minutes. The delay shown is thus two hours and twenty-five minutes, due to this particular case of trouble.

The tabular summary of the causes of interruption

to traffic shows that there were fifty-one of these, or slightly less than one per week. Of these fifty-one, eleven are chargeable to wrecks and bad track, for which the electric traction department is in no way responsible, so that the actual number is forty, or an average of three and one-third per month.

The total period of delays to movement, including those due to wrecks and bad track, is 161 hours and twenty-five minutes, and excluding these, 101 hours and twenty-five minutes. This is two and one-half hours for each of the forty delays, or an average of eight and one-half hours a month.

LINE TROUBLE ABSENT IN MARCH

It will be noted in the log that in one month, March, 1922, there were no line troubles reported, and further, as would be expected, that the interruptions are very light in the summer and relatively heavy in the winter.

For purpose of study, it is interesting to segregate the troubles into classes, in each of which there is a common element. Taking up first the transmission and contact line system, there were six short circuits on the line from unknown causes, none of which resulted in delays to traffic. Lightning was responsible for six trouble reports, accompanied by negligible delay. The

Aug. 8	Empire	Trolley burned in two at Empire outlet.	..	..	Nov. 24	Eckman	44,000-volt line burned in two at Eckman, smoke from steam engine.	3	30
Aug. 13	Pulaski	Loco. No. 2,503 wrecked No. 1 pantograph, due to bad track.	1	..	Nov. 25	Eckman	Wood stick flashed on crossover, west end of Eckman Yard.	..	..
Aug. 18	Keystone	Fireman burned, putting up pantograph on Loco. No. 2,510; climbed on roof of cab.	..	30	Nov. 26	Eckman	Loco. No. 2,504 wrecked No. 1 pantograph east end of No. 10 track. Bad track.	1	30
Aug. 21	Dans' Branch	Loco. No. 2,508 wrecked pantograph, due to wood pole splitting and allowing dead end to slack off.	..	45	Nov. 28	Bluefield Pit	Trolley burned in two on storage track. Improper handling of pantograph.	..	40
Aug. 22	North Fork	Loco. No. 2,508 wrecked pantograph, cause unknown.	..	20	Dec. 1	Eckman	Loco. No. 2,504 wrecked pantograph on No. 10 track, east end of Eckman Yard.	2	35
Aug. 24	Flat Top	Set of insulators flashed.	1	10	Dec. 2	Eckman	Loco. No. 2,504 wrecked pantograph on No. 10 track. Bad track and pantograph out of line.	1	10
Aug. 24	Simmons	Tree fell across line; also three insulators flashed, due to lightning.	..	..	Dec. 12	Eckman	Loco. No. 2,508 wrecked pantograph on No. 10 track. Bad track.	2	..
Aug. 28	Ruth	Loco. No. 2,510 knocked horn off pantograph.	..	..	Dec. 19	Bluefield Yard	Set of insulators flashed on lead. Engine No. 2,036 standing under insulators popped off.	..	20
Aug. 30	Flat Top	Loco. No. 2,501 bus line burned in two.	..	..	Dec. 20	Eckman	Steady span burned in two.	3	45
Sept. 1	Ennis	Loco. No. 2,509 wrecked No. 1 pantograph at Ennis crossover.	..	..	Dec. 26	Clift Yard	Cat climbed wood pole and bridged set of insulators.	..	..
Sept. 7	Bluefield Pit	Motor run onto grounded line.	..	..	Dec. 26	Bluestone	Insulator flashed on pantograph on Loco. No. 2,502. About 4 ft. of messenger wire found on cab.	..	..
Sept. 12	Bluefield Yard	Loco. No. 2,502 wrecked pantograph, No. 10 track, west yard, ran engine onto non-electrified track.	..	45					
Sept. 12	Eckman Yard	Loco. No. 2,509 wrecked No. 1 pantograph on No. 6 track; pantograph out of line.	2	15					
Sept. 13	Vivian	Loco. No. 2,503 wrecked No. 1 pantograph on No. 5 track in Vivian Yard. Bolt came out of clip.	1	25					
Sept. 15	Bluestone	Loco. No. 2,501 ran onto non-electrified track.	..	..					
Sept. 16	Bluefield Pit	Switch opened on pit track with locomotive spanning breaker.	..	..					
Sept. 27	Bluefield Yard	Loco. No. 2,510 wrecked pantograph on crossover at passenger station.	..	..					

storm of Aug. 24 was a severe one, causing a tree to fall across the line, as well as three insulators to flash, but with no delay to traffic. The worst that the lightning did was usually to flash insulators, although in one case the burn-off of a feeder may be attributed to this cause.

In the electric zone it was not possible to use the ordinary rope "ticklers" which are customary on steam railroads to indicate to trainmen on the roofs of the cars that a tunnel or a low bridge is being approached. Instead, a reed fishpole hinged to the catenary side column is substituted. This extends over the track in such a position that the pantograph of an approaching train strikes it and causes it to swing parallel to the track. Occasionally in striking the pole the pantograph breaks off a piece of it, which drops down on the roof and grounds the pantograph. This is particularly true during heavy rainstorms. A total delay of three and three-quarter hours was attributed to this cause.

The smoke and steam from steam engines caused difficulty on four occasions, a negligible number in view of the fact that all passenger and freight trains go through the electric zone behind steam engines. Two engines popped off under insulators, one short circuited the 44,000-volt line by means of smoke, and another flashed over an insulator and burned out a messenger. These four accidents account for more than a sixth of the total year's delay.

Aside from the insulator troubles mentioned, the line insulators gave a good account of themselves. Occasionally there was a flashover, usually with a trifling delay or none, although an insulator flash early in

January did cause a three-and-one-quarter-hour delay. The regular inspection and renewal of insulators described in the article in the issue of this paper for Aug. 11, 1923, page 203, insures a minimum of insulator troubles in service.

Something over one-sixth of the total time of delay tabulated may be charged to the burning off of contact and span wires and difficulties with switches and circuit breakers. The total for the year, however, is only ten, mostly minor troubles.

Locomotive troubles, aside from the pantograph wrecks already referred to, were of minor importance, having caused less than five hours' delay during the year. These include pantograph insulator flashovers, circuit breaker failures and wiring burnouts. The number coming within this class is ten, or less than one a month.

THE PANTOGRAPH IS THE MOST SENSITIVE PART OF THE EQUIPMENT

The pantograph is naturally the part of the locomotive which comes in for the most severe punishment. In construction it must be light and flexible to function properly. It is liable to injury from causes which have nothing to do with the electric equipment. For example, during 1922 nine pantograph wrecks were due to the track being out of alignment, another was caused by the splitting of a wood pole, another by the breaking of a driver spring, and still another by a pin falling out of an insulator. In another case a board from a bridge struck the contact wire and wrecked the pantograph. A large proportion of the pantograph wrecks

TABLE II—SUMMARY OF LINE TROUBLES
CAUSING TRAFFIC DELAY

Number of Cases	Nature of Trouble	Delay to Movement	
		Hrs.	Min.
2	Insulators flashed on pantograph	1	55
2	Steam engine popped off under insulators	7	5
6	Wrecked pantograph, cause not determined	9	10
1	Wood stick flashed	15	15
1	Wrecks	63	0
1	Body span burned in two	1	15
3	Defective insulators	5	7
4	Ran onto non-electrified track	3	35
6	Defect on electric locomotives	6	30

2	Trolley burned in two	1	55
1	Steady span burned in two	3	45
4	Foreign material on locomotive roof	4	20
7	Miscellaneous	13	9
1	Lightning	1	55

occur at crossovers, where the overhead line has to be more complicated than on tangent track.

In a few cases pantographs are wrecked due to their own defects, not more than three, however, during 1922. Occasionally one is injured through an unknown cause. On the whole, the pantograph is the cause of more delays than all other pieces of apparatus together.

In spite of watchfulness on the part of employees of the electrified section, men will occasionally forget or misunderstand instructions, causing unnecessary delay or inconvenience. There were from fifteen to twenty cases last year which can be thus classified, but among them all they caused but a little more than three hours delay. Such accidents as raising a pantograph with the ground on another pantograph, raising a pantograph with a ground hook on it, opening switches with power on, running onto non-electrified track or grounded line, etc., illustrate this class of trouble.

The log includes the result of a train wreck which caused a total delay of sixty hours. One signal bridge and one tubular bridge were knocked down and a short circuit was caused by the wreck.

The Readers' Forum

Additional Information on Steel Wheel Mileage

WASHINGTON RAILWAY & ELECTRIC COMPANY
WASHINGTON, D. C., Nov. 5, 1923.

To the Editors:

In the article appearing in the Aug. 18 issue of *ELECTRIC RAILWAY JOURNAL* under the heading "Wheel, Gear and Axle Practice" (on page 250) is shown certain data in the nature of mileages obtained on our property from different types of wheels for the year 1920. Since you obtained the figures as shown we have prepared similar statistics for the years 1921, 1922 and the first six months of 1923 which I think are more representative.

The Davis wheels that were scrapped during the year 1920 because of being unfit for further service were mostly put in service during 1918. Because of the stress of war conditions at that time, the factory did not turn out the high quality product that it is now doing. This directly affected the mileage obtained from the wheels of the Davis type that were installed during that year.

The mileage shown as obtained from 31-in. rolled steel wheels during 1920, while correct, is also misleading because we did not commence the extensive use of rolled steel wheels until the spring of that year. We did have a few rolled steel wheels that were put into service in 1918 for experimental purposes, and during 1920 four of these first wheels were scrapped because of being worn out. The average mileage for the four wheels was 90,000, but the mileage obtained from such wheels does not conclusively prove that similar results will be obtained from such wheels when used extensively. In the table below are shown the mileages of wheels on our property for the years 1920, 1921, 1922 and six months of 1923.

You will note from this that the Davis wheels have steadily increased in mileage and decreased in cost per 1,000 miles each year. In order to get the mileage shown for the rolled steel wheels it was necessary to remove them from service twice for turning, while in the case of the Davis wheels they were not removed after first installed until ready to scrap. This is decidedly in their favor.

We obtain the mileage of wheels scrapped by keeping an individual card record for every wheel on our system from the time it is put into service new until it is removed and scrapped. The number of wheels by types and sizes that were removed and scrapped during each month is also compiled, which shows the total mileage actually made by the scrapped wheels. This divided by the number scrapped gives the figures used for average mileage.

The reason we obtained better mileage from 30-in. Davis wheels than from 33-in. Davis wheels is because the latter are used entirely under 54,000-lb. cars operating at fairly high speeds and with frequent stops and severe braking conditions. The 30-in. wheels are used under cars weighing around 35,000 to 40,000 lb. in strictly city service. A large amount of our track is grooved rail with a very narrow groove which has only $\frac{1}{4}$ -in. clearance over wheel flange. Consequently the rolled steel wheel flanges wear very fast on the back side of the flange, which necessitates frequent turning, resulting in low total mileage when worn out. The Davis wheel having a very hard flange does not wear anywhere near as fast as the steel wheel.

R. D. VOSHALL,
Superintendent of Equipment and Buildings.

WHEEL MILEAGES FOR THE YEARS 1920, 1921, 1922 AND FIRST SIX MONTHS OF 1923
WASHINGTON RAILWAY & ELECTRIC COMPANY

Type of Wheel	Year 1920		Year 1921		Year 1922		First Six Months, 1923

Maintenance of Equipment

Selection of Waste for Motor Bearings

BY HENRY S. DAY*

Railway Department, Westinghouse Electric & Manufacturing Company

WITHOUT good wool waste bearings of motors and truck journals cannot be properly lubricated, and the ratio between good and bad lubrication and good and bad waste is about the same. Probably there is no one article in the storeroom of the electric railway that varies so in quality and grade as the waste used for packing bearings.

The amount expended for lubrication which covers oil, grease and waste packing is only a very small percentage of the total cost of equipment maintenance, but poor lubrication causes a very large percentage of the troubles. Frequently a railway that has low lubrication costs has high costs for repairs. Many factors enter into poor lubrication besides poor waste, and there are many opinions as to what constitutes good packing. Years of operation have demonstrated that to feed oil properly and to prevent sagging the packing should be composed of pure wool yarn with few short strands. Strands should not be less than 12 in. or 15 in. long, should also be of a good diameter and well mixed. Such wool yarn will feed oil and at the same time retain a resiliency sufficient to hold it in place against the journal without sagging or matting.

Many specially prepared types of packing waste are composed of various grades of wool yarn mixed with cotton strands and different kinds of fibrous substances. Some of these prepared packings give fairly good results. If the packing is of an inferior grade and has a high percentage of cotton and fiber, it cannot lift sufficient oil to carry away dirt, dust and foreign substances that all tend to shorten the life of the bearing and wear the journal.

An additional cause of lean feed-

Montreal's Crane Car Ready for Service

ing in a mixed packing is the tendency for cotton and fibrous substances to bunch up and mat from vibration and thus introduce barriers which break the path of oil in its upward flow and reduce the amount that reaches the journal. Mats or pads formed this way also catch and hold sand and dirt which cannot fall to the bottom of the housing or journal box. Cotton and fibers when they come in contact with a moving journal will also form a glazed surface which will frequently cut off the oil flow. Another advantage of high-grade wool packing is that it can be washed and reclaimed and so be used over again.

Bearing and journal wear is costly and the source of much trouble. Good packing, oil and grease are a comparatively small item in the operating cost, and a liberal use of the best that can be procured will prevent much expense and many failures.

Well Constructed Crane Car for Montreal

THE Montreal Tramways has recently added a new crane car to the present work car equipment. The underframe was designed and built in the shops at Youville. It has an over-all length of 42 ft., width 8 ft. 5 in. and 41 in. body height, with an over-all height over top of rotating crane cabin of 11 ft. 5 in. The low body height was necessary to give the required subway clearances.

The body is of very rigid construction, consisting of two fish belly girders of $\frac{3}{8}$ -in. plate and $2\frac{1}{2}$ -in. x $2\frac{1}{2}$ -in. x $\frac{3}{8}$ -in. angles, connected by intermediate girders of $\frac{3}{8}$ -in. plate and $2\frac{1}{2}$ -in. x $2\frac{1}{2}$ -in. x $\frac{3}{8}$ -in. angles and heavy channel box bolsters. The rear end is covered by the half-inch plate to which the base ring is fastened, this forming the bolster top plate, also tying the whole structure together and preventing any twisting of the body due to swaying loads

Underframing of New Crane Car

*Formerly superintendent of equipment Kansas City Railways.

when the crane is revolved. The body and trucks are equipped with interlocking side bearings which transmit the load directly to the truck side frame, thus relieving the bolster of the lifted load.

The trucks, which were built in the company's shops, are placed at 27-ft. centers. They are of 6-ft. 3-in. wheelbase with 30-in. wheels and special axles. The front end is fitted with a 5 x 6-ft. cab for the motor-man.

A K-35 controller handles the driving equipment of four Westinghouse 533 motors connected in series, series multiple, to allow for slow movement with a lifted load. The weight of the car equipped is 77,600 lb.

The crane proper, which was purchased from the Ohio Locomotive Crane Company, weighs 37,100 lb. and is driven by a Westinghouse 37-hp. type K motor. It has a lifting power of 17,000 lb. at 12-ft. radius, 12,000 lb. at 15-ft. radius and 8,500 lb. at 20-ft. radius, these limits being fixed by the stability of the whole structure on the limited base of the 4-ft. 8½-in. rail gage. Much greater loads can be handled over the rear end of

the car and, when suitable, struts are inserted between underside of car frame and the ground to give a wider effective base.

Maintenance of Bearings and Welding Practice

By O. A. NORENE

Assistant Master Mechanic Omaha & Council Bluffs Street Railway

BOTH cast and malleable iron Baxle collars are being replaced with cast steel collars in Omaha. We are also discarding the cotter keys in all the collars and replacing them with plain locknuts which lock the screws rigid to the collar and prevent the threads from wearing on both screw and collar.

We are using cast steel axle shells, babbitt lined, on all our motors where a thickness of shell is ½ in. or over. The shells are machined in a specially designed jig in which they are held rigid without distorting them in any way. Two sets of jigs are used for each type of bearing, to permit the operator to change one pair of shells while the other set is

being machined. The babbitting is done in a special mold where the bearings are cast finished complete with oil grooves. All halves are interchangeable. It has not been found necessary to tin these shells, as anchors cast in the flanges and body of the shell are ample to hold the babbitt.

REPAIRS BY WELDING

For repair of broken truck frames, cast steel bolsters, motor cases or for any heavy welding we are using the thermit process. Armature shafts are welded in this manner if broken at the pinion end and if the winding is found to be in good condition. The weld is always made from 2 in. to 3 in. from the end of the pinion taper. This is done principally to get as large an area for weld as possible.

Worn pinion fits and broken and worn keyways in armature shafts are built up with oxyacetylene torches and the shafts machined to standard sizes. We have discontinued entirely the use of so-called liners of sheet iron, canvas or paper, and by so doing we have also elimi-

The Roadmaster Catches H—

"MR. REDFIELD, did you see the editorial in this morning's Jinxville *Clarion*, complaining about our track on Main Street?" asked Charlie Riter, Mr. Redfield's clerk, on the boss' arrival at the office.

"Yes, Charlie, I did, thanks, but I'm pleased to note that you take enough interest in the property to call my attention to it. That track ought to have been fixed up long ago. I'll see Tom Fairweather about it today. He's roadmaster and it's his job to forestall such complaints. Here's the superintendent; we'll see what he has to say.

"Good morning, Bill, I see the *Clarion's* after us about our Main Street track."

"No wonder, Mr. Redfield, that track's a disgrace. The joints are the main trouble and they are awful. John O'Neill and I learned something about track at the Atlantic City convention that we ought to apply here. I wish you'd have Tom put in some of the welded joints that we've heard so much about."

"I'll see him today, Bill. Something's got to be done. We must make a start anyway before next Sunday. Charlie, get hold of Mr. Fairweather as soon as you can and tell him to come to my office."

On Fairweather's arrival the G. M. lost no time in coming to the point.

And he takes it because he knows he's been asleep. General manager of Jinxville Railway says roadmaster's slackness was responsible for justified complaint of riders as voiced in newspaper editorial. Insists that fault be acknowledged and conditions rectified and makes deep impression

—♦♦♦—

"Good morning, Tom. This morning's paper says our Main Street track might be improved. What about it?"

"Sure, Mr. Redfield, it's the worst piece of track in town, but I don't think they ought to roast us about it that way. I intended to patch it up next spring."

"Look here, Tom, don't you realize that if the public has good reason for a complaint like this it makes it mighty hard to maintain good terms with our car riders?"

"Oh, it's just one of them young reporters who wanted something to complain . . ."

"Stop right there, Tom. You're all wrong. Gainway says there's good reason for the complaint and, as superintendent, he ought to know. Trouble with you is you're not keep-

ing up to the times. What kind of track joints have we on Main Street?"

"Fish-plates; same as we've always used. I never took much stock in these newfangled joints."

"Well, you've got to take stock in them from now on, Tom. You had better get yourself posted right away on these welded joints and jointboosters and one thing and another that Bill and John say stirred up so much interest at the convention. I want to put an ad in the *Clarion* telling the people of Jinxville that improvements are going to be made. If we've been slack, let's say so, but saying at the same time that we're going to fix up the track right away. We'll tell them, too, that we have done a lot of other things to improve service on this property in the last year.

"Now don't fall down on this job, Tom, even if you have been working here for thirty years. You can keep up to date if you'll read the *JOURNAL* and think and keep up with what other people are doing. You know I don't want to get a new roadmaster unless I have to. Let me know tomorrow what we ought to do on Main Street and how soon we can get it done, so I can write my advertisement."

"I guess maybe you're right, Chief. I have been a little slack. I'll get right after this."

nated almost all the loose pinion trouble we used to have. No attempt is made to build up the worn bearing surface on an armature shaft by welding. When worn down too small, a seamless steel tubing is shrunk on to bring the shaft to standard size.

Reducing Exposed Pole Hazard

THE trolley pole shown in the accompanying illustration is located in the plaza at the entrance to Prospect Park, Brooklyn. It had to be set well out toward the center of the plaza in order to support the overhead work at the intersection of two streets, on both of which there were electric railway lines. In this location it was in constant danger of being struck by passing vehicles. In order to make the pole conspicuous at night as well as during the day, a cluster of ten lights was installed at the top of the pole. Then to make it stand out even in the daylight it was painted, in accordance with a city ordinance, with alternate white and black stripes for a distance of approximately 12 ft. above the ground line.

It was further protected by a cast-

A Thrice-Protected Pole

iron wheelguard at the base of the pole. This wheelguard will deflect wheels of passing vehicles to one side and greatly lessen the blow as well as cause the wheel to be struck rather than the body of the vehicle, so that if the automobile or wagon were damaged it would be in a part that would not also cause injury to any persons who might be riding in the vehicle.

Automatic Control for Shop Compressor

BY H. COWEN

General Foreman New York Railways,
New York, N. Y.

AT THE Fiftieth Street shops of the New York Railways compressed air for hoists and pneumatic tools was supplied by a "Platt" straight-line, single-stage, double-acting compressor, driven by duplex belts from an overhead countershaft belted to a 75-hp. motor. This compressor had been in operation over twenty years and increased demands

General Electric type MC Westinghouse 275 line switch, conductor's valves, fender trip cylinder and a standard 5-in. check valve were piped, as shown in the accompanying diagram.

Referring to the diagram, A is the inlet to the compressor, B the discharge to the reservoir, C an unloading connection, D a check valve control line, E the connection from the reservoir to an electropneumatic line switch, F the line switch and G the discharge to atmosphere. During compressor operation, the line switch F is de-energized and the conductor's

for air imposed excessive duties on it and necessitated the use of larger supply reservoirs. The only ones available were ample in size for maximum requirements, but excessively large for the normal shop needs. This resulted in the compressor running idle for a major portion of the days and caused overheating.

Frequent shutdowns were necessary for repairs, such as renewing main and crankpin bearings, cross-head gibs, inlet and discharge valves and seats. The two latter resulted from deposits of carbonized oil, caused by excessive temperatures. These troubles were not anticipated, as an unloading device formerly part of the compressor and connected in the inlet pipe was expected to control the compressor operation during rush and normal periods. Its function, however, was merely to restrict the inlet flow of air and it did not eliminate idling, with its attendant waste of power and rapid wear of parts. Automatic control was therefore added by the use of several spare air-brake parts. A shop-made automatic controller was used for stopping and starting the compressor motor, at a minimum reservoir pressure of 40 lb. and maximum pressure of 65 lb. These, together with the spare air-brake parts, such as the

valve is closed, which prevents the escape of air from the compressor cylinder to atmosphere. When the air pressure in the supply reservoir reaches the required maximum of 65 lb. the G.E. governor, previously adjusted, opens the main motor circuit and the compressor comes to rest.

As air is consumed the reservoir pressure diminishes to 40 lb., when the governor cuts in and closes the motor circuit, simultaneously energizing the magnet valve in F so that communication is established between the reservoir and the conductor's valve trip cylinder. This moves the trip arm J upward and opens the conductor's valve so that a rapid release of the air confined in the compressor cylinders occurs, which removes the resistance against starting. Without this arrangement, proper acceleration of the compressor was impossible because both the motor and countershaft belts slipped and in many instances these were damaged.

After the motor circuit is closed, the automatic contactors on the switchboard gradually cut in resistance as the acceleration progresses. When the magnet valve in F is de-energized, the trip arm J drops and closes the conductor's valve and the atmospheric discharge line from the compressor cylinder. Air now passes through the main discharge and check valve into the main supply reservoir.

The check valve *K* functions only during the acceleration period, when air passes from the unloading pipe to the cylinder *H*, which contains a piston and rod integral with the check valve stem. By adjusting the screw pressure on a coil spring as shown in the enlarged section of the check valve the air pressure, for completed acceleration, is regulated. When the piston moves up the check valve is held open, allowing air to flow from the compressor to the supply reservoir. This eliminates pounding of the check valve on its seat.

To prevent a general discharge of air from the supply reservoir through the unloading and atmospheric lines, at the instant of starting, a conductor's valve *L* with a

multiplying lever is connected to the check valve control line, so that the air in the check valve cylinder discharges to atmosphere and allows the valve to seat before the main conductor's valve opens.

A series of tests made after installing this apparatus showed that during 50 per cent of the working day the compressor was not required to operate. The reduction in power consumption and the elimination of shutdowns have produced a substantial saving. Furthermore, renewals of main valves, seats, bearings, etc., have not been necessary during the past two years, and an improved shop output has resulted from the successful operation of the compressor.

New Equipment Available

Truck-Mounted, Electrically Driven Compressor

TO MEET the demands of electric railway track departments for an electrically driven air compressor, which can be readily and conveniently moved about, the Ingersoll-Rand Company, New York, N. Y., is placing on the market a new type 20 equipment shown in the accompanying illustration. A standard Ingersoll-Rand duplex air compressor, with 5-in. x 5-in. cylinders and having a capacity of 91 cu.ft. piston displacement per minute, is direct-connected to the compound-winding direct-current motor used for driving.

The motor obtains its current from the overhead trolley and is designed to operate at practically constant speed within a range of 400-600 volts on the trolley. This

takes care of the voltage variation commonly experienced in electric railway service and maintains the capacity of the outfit under practically all conditions. This outfit has sufficient capacity so that it will operate four tie tampers or two paving breakers.

The use of an electric drive which can be operated directly from the overhead trolley supply is a particularly attractive feature to electric railway track men, and the constant speed feature is of advantage. The type 20 equipment is offered either ready for mounting on any standard Ford truck or complete with truck as specified. Some companies have found it convenient to make use of old motor trucks with this unit, as the amount of actual travel in miles which such a unit is required to make is comparatively small.

Air Compressor for Trackwork Mounted on Truck

Continuous Thermostatic Wire for Fire Alarm Systems

AN AUTOMATIC fire alarm system applicable to railway car-houses, substations, etc., is marketed by the Fire Detecting Wire Corporation, New York, and is said to possess several advantages over other systems now widely used. It consists of various circuits of continuous thermostatic wire, each connected with a centrally located control panel and with alarm gongs. In the event of fire, or even of undue heat, an alarm will be given before the fire has become dangerous. This thermostatic wire consists of a core of special fusible alloy covered with a protecting metal jacket having a narrow open seam. Superimposed upon this is a permeable wrapping of cotton yarn which provides insulation between the core and an outer conductor of spirally wound brass tape. On top of this is a layer of

varnished cambric to protect the wire against grounding and a varnished cotton braid outer covering to give mechanical protection.

The soft metal in the interior of the wire has a fusing temperature of 160 deg. F. The wrapping material outside, however, has a retarding effect equivalent to about 20 deg., so that the actual fusing temperature of the wire is about 180 deg. under normal conditions. Under a very slow heat the fusing point is reduced to approximately 160 deg., because the whole mass has time to become thoroughly heated.

When the metal core fuses, it spurts through the seam in the protecting cover and through the permeable insulation, making electrical contact with the outer conductor of brass tape. This shunts out a resistance, and the alarm box, indicator, etc., give their warning.

Although the fusing point of the

metallic alloy is theoretically about the same as that for sprinkler heads, nevertheless experience has demonstrated that the alarm will always be sounded some time before the sprinkler system operates. The reason for this is that the metal pipes of the sprinkler system and the water contained therein tend to carry away the heat from the sprinkler head and thereby postpone its melting.

A supervisory current passes continuously through all parts of the system, including the core and brass wrapping of the wire. Any interference with this supervising current, such as that caused by an open circuit, results in a trouble signal. False alarms have been eliminated.

Wires are spaced about 10 ft. apart or approximately the same distance as sprinkler pipes. A single circuit may contain from 1,000 to 1,500 ft. of thermostatic wire. With the 10-ft. spacing 1,000 ft. of wire will protect 10,000 sq. ft. of floor area. When desirable smaller sections may be used, giving a finer allocation of alarm.

An interesting possibility in the thermostatic wire is its use in automatic substations. Stations may be wired not only for fire but for protection against overheating of transformers and other apparatus. The installation of the thermostatic wire makes it possible to sound an alarm and automatically shut the station down in case of fire or the overheating of any of the equipment, which is particularly desirable for older type manually operated stations.

New Switch Provides Unbroken Main Line Rail

A TYPE of switch which embodies several new features is being marketed by the Railway Safety Equipment Company, Inc., Philadelphia, Pa. It is called the Freeburg Heel-less Safety Switch. The throw is made through the medium of a camshaft set in the switch block. This operates two tongues vertically. The use of two tongues eliminates the usual heel of other type switches and provides an unbroken main-line rail as well as unbroken curved rail. One tongue counterbalances the other, so as to provide for a simple and easy throw, whether by hand or automatic operation. The elimination of the heel prevents pounding which results in breaking down the switch bed. Excessive noise, as well as wear and tear on car equipment,

The Moving Part of This Switch Consists of Two Tongues and a Camshaft

is also reduced. When thrown for either the curve or main line, the tongues are locked in position and the vertical action of the tongues between solid steel centers prevents splitting of switches.

Wheels for Either Road or Rail Service

A WHEEL system which can be converted from that used on highways to a form suitable for operating on rails is described in *London Engineering* for Oct. 12. The device is being manufactured under the trade name of "Motorailer" by the Motorailer Transport Company, Ltd., London, England. Two applications of the system are now in service.

One design shown in the accompanying illustration consists in using a motor wheel of the rail-car type

Wheel Rim Design for Use on Either Track or Road

made of high carbon steel. To convert this to a form suitable for road service, a tapered loose rim is used. This slips over the main rim of the wheel and forms an intermediate member between it and the steel ring

at the base of the rubber tire. This loose ring is machined at an angle and is mounted in a manner similar to that used for holding piston rings. It is held in position by six $\frac{1}{2}$ -in. hardened steel bolts with sector-shaped heads. These fit into a milled slot in the loose rim.

Another design of rim construction is for use on a standard Ford truck. With this construction a pressed steel rail rim is attached to the wheel rim, the steel rim replacing the ordinary detachable rim generally used with rubber tires. An accompanying illustration shows the type of construction and method of fastening.

Non-Magnetic Cast Iron for Resistance Grids

NON-MAGNETIC cast iron has been produced by Messrs. Ferranti, Ltd., Lancashire, England, and has been patented by them in Great Britain and the United States. Its registered name is "Nomag." The magnetic permeability is practically the same as brass, while its electrical resistance is 50 per cent greater than ordinary cast iron. This combination in one metal is of advantage in electrical machinery construction. An increase of temperature causes a slight reduction in the permeability of the metal.

The mechanical properties generally are the same as cast iron, but Nomag has advantages in greater toughness and malleability, which are observable both in its high transverse deflection and in its resistance to shock. These qualities render the metal peculiarly suitable for resistance grids, especially when used for electric railway purposes.

In the design of electrical machinery and apparatus non-magnetic metals such as brass, gunmetal and aluminum are used where an alternating or rotating flux is present, in order to avoid hysteresis. The metals are not only relatively expensive but, as they are good conductors of electricity, they are susceptible to eddy currents.

The new metal is similar in appearance to ordinary gray cast iron and can be cast with the same facility and with the ordinary foundry equipment, although its shrinkage is $\frac{1}{8}$ in. per foot as compared with $\frac{1}{4}$ in. per foot for ordinary cast iron. It compares very favorably with ordinary cast iron in machining.

Association News & Discussions

Progress in West Virginia Railway Electrification*

BY STEPHEN Q. HAYES

General Engineer Westinghouse Electric & Manufacturing Company

WEST VIRGINIA is one of the most important states of our country from a power development standpoint, and must be considered as a pivotal point around which will doubtless center a large part of the super-power system that may ultimately tie together all the Eastern and Southern sections of the United States.

The coal deposits of a single county of West Virginia if sold at \$2.50 per ton would clear off the national debt of the United States. The water powers of West Virginia have been practically untouched, as the demand for power in the sections near such power sites has not warranted development. It most cases it has seemed more economical to generate the power by steam used in local power plants or in larger stations transmitting to the point of utilization. Later it may prove highly desirable to develop all possible water power so as to conserve the supply of coal, and to transmit power electrically from such water-power plants to points where it can be utilized advantageously.

The demand for West Virginia's coal for domestic and foreign use is such that anything that may be done to improve the coal-handling facilities of the important railways traversing the state is of vital importance to all users of coal. The Norfolk & Western Railway has already electrified its Elkhorn grade, relieving the congestion formerly existing at that point and greatly increasing the possibility of coal shipment over that railroad. The Virginian Railway is now arranging an extensive electrified section, while the Baltimore & Ohio and Chesapeake & Ohio railways are laying their plans for similar work.

The report of the Hoover super-power conference brings out the advantages to be gained by interconnection, and great economies in distribution through the interchange of loads between neighboring systems, securing a reduction of the amount of reserve equipment needed by having a better load factor. In the super-power survey made in the Northeastern States under the direction of W. S. Murray, it was calculated that the super-power systems proposed would conserve about 50,000,000 tons of coal per annum, with an annual saving of

\$500,000,000 at an additional capital outlay of \$1,250,000,000.

Electrification of the railroads and a direct connection between them and the power resources available will be considered by the Giant Power Survey Board of Pennsylvania. One-third of the present railroad haulage in Pennsylvania is coal. By eliminating much of this low-grade freight the railroads will be free for other purposes.

The electrification of the Elkhorn grade on the Norfolk & Western Railway has now been in service for such a length of time that the benefits are fairly well known. The purpose of this substitution of electricity for steam was to increase the capacity of the railway line by materially reducing the time required to handle trains, and also to provide a more economical and efficient service over the heavy grades. With this end in view, the electric locomotives were designed to handle the heavy freight trains up the grade at a running speed of 14 m.p.h. as compared with about 7½ m.p.h. under steam operation.

TWO ELECTRICS DO THE WORK OF THREE STEAM LOCOMOTIVES

The coal trains formerly handled in this service weighed 3,500 tons and were hauled up the grade by three Mallet steam locomotives. Two of these, a road engine and a helper, were used over the entire division. The third engine located at the rear served as a pusher at the 1.5 per cent and 2 per cent grades, and was cut off at the summit. Now a single electric engine is used over the electric division, and a second electric engine is used as a pusher up the heavy grade. One electric engine, therefore, takes the place of two Mallets over the division; and two electric engines take the place of three Mallets up the grade. A 4,800-ton train has been hauled in this manner. The constant-speed feature of the locomotive is considered a decided advantage in dispatching traffic through the single-track tunnel.

In all cases, the electric locomotives handle the train at approximately double the speed obtained with steam. On the 9-mile grade between Cooper and Graham, where the maximum rise is 0.4 per cent, and some stretches are level, the speed of the electric locomotive is 28 m.p.h.

The electric installation was designed for handling a daily total of twenty eastbound trains of 65,000 tons over the division, and ample provision was made for additional traffic and extension of the electrified track when required.

A notable achievement on this electrified section was the handling of 90,000 tons eastbound over the Elkhorn grade and through the single track tunnel at the summit in a single day.

The increased train speed and reduction in road delays obtained with the electric locomotive have greatly increased the track capacity on the mountain grade section. The officials of the Norfolk & Western Railway have stated that the electrification approximately doubled the track capacity of the electrified section and that the capacity of their entire system has been materially increased due to the speeding up of traffic on the grade section.

Another notable railway electrification of vital interest to West Virginia is that of the Virginian Railway, which has been recognized as a leader in mass transportation. This railroad is today operating the heaviest trains in the world with the most powerful steam locomotives. It is handling approximately 7,000,000 tons of coal per year, but the potential capacity of the mines it serves is far in excess of this amount and extensive new mine developments are under way.

The initial electrification of this railway will extend from Mullens, W. Va., where the coal is collected from nearly all of the mines served, over the heavy grade section to Roanoke, Va. There is an equivalent 2 per cent grade for approximately 10 miles just east of the western terminus of the electrification. This hill section is double track, but the remainder of the line is single track. The electrification will cover a route distance of 132 miles, and the track mileage to be electrified is approximately 213.

Under the present plan of steam operation, trains of maximum weight of 5,500 tons are hauled from the Elmore yard to the top of the hill at Clark's Gap with two Mallet pusher engines of the 2-10+10-2 type and a road Mallet engine of the 2-8+8-2 type. The speed on the heaviest grade section is 6 to 7 m.p.h. From Clark's Gap to Princeton, this train is handled by the road locomotive. At Princeton, which is an engine terminal, trains of a maximum of 8,500 tons are made up and taken east to Roanoke with the same road engine and a helper out of the Princeton yard, and up the Allegheny mountains from Whitehorne to

*Abstract of a paper presented at the Charleston meeting of the West Virginia Public Utilities Association, Nov. 9, 1923.

Merrimac. These Mallet pusher engines have a tractive power rating of 147,000 lb., operating compound, with a weight of 617,000 lb. on their drivers, and a total weight of engine and tender of 898,000 lb. The Mallets used as road engines have tractive power rating of 101,000 lb.

With the contemplated electric operation, trains of 6,000 tons will be handled from the Elmore yard to Clark's Gap with one road locomotive and one pusher, each being composed of three cabs or units. The speed will be 14 m.p.h. At Clark's Gap trains will be filled out to 9,000 tons, and the road locomotive will take this train all the way to Roanoke without a helper at a speed of either 14 or 28 m.p.h., depending on the grade and alignment conditions.

Each locomotive unit will weigh approximately 200 tons, and the weight per driving axle will be 75,000 lb. Each unit will have a continuous rating of 1,700 hp. at 14 m.p.h., and 2,000 hp. at 28 m.p.h. These electric locomotives are of the so-called split-phase type, similar to those used on the N. & W. Power is supplied from a single-phase trolley at a frequency of 25 cycles at either 11,000 or 22,000 volts.

Since the driving motors of these locomotives are of the induction type, the locomotive automatically becomes a generator and returns power to the trolley when the train tends to drive the motor above synchronous speed on descending grades. In this case, the speed rises slightly with load, but the total variation from maximum load motoring to maximum load generating is only about 10 per cent.

TURBO-GENERATING STATION TO SUPPLY POWER

Power for the Virginian electrification will be supplied from a steam turbo-generating station to be installed by the railway on the New River at Narrows. The initial capacity of this plant comprises four units, each with a maximum rating of 15,000 kw.

Two single-phase, 88,000-volt transmission lines carried on steel towers will supply outdoor transformer stations along the right-of-way, where the voltage will be stepped down for the trolley supply.

The initial power supply equipment will be sufficient for handling approximately double the present tonnage and sufficient for a maximum day traffic of 60 per cent in excess of the average corresponding to that figure.

Moreover, while three locomotive units will normally be coupled to form a service locomotive for handling 9,000-ton trains initially, the locomotives are so designed that four units may be coupled to handle 12,000-ton trains when the rolling stock is improved so that trains of that weight are feasible.

Power is to be supplied from a single-phase trolley at a frequency of 25 cycles and 11,000 volts. The locomotives and transformers and the distribution system are so designed that

when trains of 12,000 tons are handled, the trolley voltage can be changed to 22,000 by making a simple change in the transformer connection.

As the Virginian Railway and the Norfolk & Western Railway parallel each other for a considerable distance on either side of the New River and are only a short distance apart at other portions of their lines, the use of the same general scheme of electrification on the two lines will permit the ready interchange of power between these systems in case of necessity and will allow each system to act essentially as spare capacity for the other.

There is a tie connection between the Appalachian Power Company and the Norfolk & Western Railroad through the frequency changer equipment at Switchback, and there may be a similar connection to the Virginian. The probable interconnection between the Appalachian Power Company and Virginian Power Company at Scarborough, and the future tie connection between the Virginian Power Company, the Kentucky-West Virginia Power Com-

pany and other power systems may ultimately lead to a general interconnection of the railway and power systems throughout West Virginia and the neighboring states.

In addition to the Norfolk & Western, and the Virginian Railway, the Baltimore & Ohio Railroad has been seriously considering electrification of certain portions of their lines in West Virginia. At present, the general limiting conditions for the B. & O. are not due to conditions on the railway lines as they now exist in West Virginia, but the terminal facilities at the ports on the Atlantic seacoast. Particular sections in West Virginia can be greatly improved by electrification.

In a somewhat similar manner, terminal facilities for the Chesapeake & Ohio Railway are possibly limiting features rather than their lines in West Virginia.

However, when the terminal facilities of the B. & O. and the C. & O. railroads at the seaboard have been increased, it will then be advisable to increase their railway facilities.

West Virginians Hold Annual Convention

THE Public Utilities Association of West Virginia held its eighth annual convention in the Kanawha Hotel at Charleston, W. Va., on Nov. 9 and 10. A number of papers of particular interest to electric railway men were presented.

W. R. Power, general manager Ohio Valley Electric Railway, Huntington, W. Va., explained various methods of curtailing accidents caused by either mechanical or human errors. He urged every member to install every real safety device on machinery, as the cost would be but small compared to safety, and he urged that all see that the employees use the safety equipment provided for them.

Martin J. Insull, vice-president Middle West Utilities Company, Chicago, declared that the two most essential needs of the public utilities are favorable public opinion and finances to permit them to provide the public with the service it demands. Most Americans, he said, were in what might be classed as a commodity business, which turns its money over several times in the course of a year, while the public utilities turned their money over but once in five years. Thus talk of profits in utility business to a commodity man was something he couldn't really understand. Profits made him think of lower rates.

The speaker said this was because utilities are a natural monopoly. The monopoly, which sometimes puzzled the public, was an economic-born thing, he said. Builders couldn't afford to install two systems of gas, electric light and telephone. One was enough, and this creates the monopoly. To make this popular, companies must do more than provide the right kilowatt hours and legal service. The public naturally falls into ways of shopping around and

is antagonistic to a monopoly, unless it was impressed with its benefits. This imposed a duty on the utility companies, Mr. Insull said.

Alexander Forward of the Virginia Corporation Commission, Richmond, Va., talked on "The Future of Public Regulation." He said he had yet to find a public utility problem of rates that could not be satisfactorily arbitrated on behalf of the public.

Stephen Q. Hayes, Westinghouse Electric & Manufacturing Company, read a paper on super-power development and railroad electrification which is abstracted elsewhere in this issue.

Other speakers included J. A. Morris, district manager American Railroad Association, Cincinnati, Ohio, on "Relation of Railroads to Utility Commissions"; W. B. Clarkson, general commercial superintendent of the C. & P. Telephone Company, Washington, D. C., "Gaining Support of the Public"; Harry Reid, president Interstate Public Service Company, Indianapolis, Ind., "Electric Interurban Possibilities," and John S. Bleeker, who explained publicity methods of the Indiana, Columbus & Eastern Railway.

The association elected the following officers: C. H. Brues, Wheeling, president; Mentor Hetzler, Moundsville, W. R. Power, Huntington, and J. E. Harsh, Charleston, vice-presidents; A. M. Hill, Charleston, treasurer, and Bliss McCrum, Charleston, secretary.

Pennsylvania Street Railways Association

THE Pennsylvania Street Railways Association will hold a convention at the Penn-Harris Hotel in Harrisburg on Dec. 4.

American Association News

Executive Committee

AN ENTHUSIASTIC meeting of the executive committee was held at association headquarters, New York, on Nov. 16. The members present were President Britton I. Budd and Executive Secretary Welsh, C. D. Emmons, W. H. Sawyer, R. P. Stevens, J. H. Pardee, J. N. Shannahan, C. E. Morgan, F. R. Coates, J. H. Hanna, C. L. Henry, L. S. Storrs, Paul Shoup, Gen. George H. Harries, A. W. Brady, C. R. Ellicott, M. B. Lambert for H. D. Shute, A. A. Hale, Barron Collier, C. S. Hawley, H. A. Johnson, J. K. Punderford, E. M. White and W. H. Hyland.

Mr. Pardee reported for the finance committee that the association's finances are in very satisfactory condition. A budget was recommended for 1924 and approved by the executive committee. This carried with it provisions for an increase in salaries of approximately 11 per cent for virtually the entire association headquarters staff, an increase in salary for the executive secretary, the renting of additional floor space. The committee also made recommendations as to the investment of certain surplus moneys. President Budd said that he had had the Bureau of Commercial Economics examine the conditions at headquarters, without expense to the association, and had received a report which spoke very highly of the efficiency of the personnel and the manner in which work was being conducted, but criticised severely the cramped office arrangement and lack of space for efficient operation. Mr. Budd said he thought it would be necessary for the association to move to some other building at the expiration of its present lease, with the idea in mind of setting up an office that would possibly serve as a model for railway men to come to.

Mr. Stevens reported for the committee appointed to nominate a new member of the executive committee to fill his unexpired term arising out of his election as vice-president. The committee recommended the appointment of Harry Reid, president Interstate Public Service Company, Indianapolis, and the executive committee approved. A motion was made and adopted that it was the sense of the executive committee that the election of a member of the executive committee to fill the unexpired term of another member should not be construed to prevent his re-election to fill one full term.

Mr. Storrs reported for the special sub-committee appointed to consider the association's relationship to the motor vehicle industry. The committee recommended that the executive committee accept the offer of the manager of the National Automobile Chamber of Commerce to organize a committee of that body to co-operate with the railway association for mutual benefit,

and made the suggestion that a committee of the railway association confer with a similar committee of executives of the National Automobile Chamber of Commerce for the purpose of considering further the working out of the suggestions.

In regard to the invitation of the Society of Automotive Engineers to co-operate in the development of standards, it was recommended that this be referred to the railway engineering association with instructions to appoint a committee for that purpose. Other matters of co-operation were left for the consideration of the above joint committees to work out in conference. The executive committee adopted these recommendations.

President Budd added to the report of this sub-committee that it was his feeling that the bus manufacturers want the co-operation of the American Electric Railway Association. He said that there is a very strong feeling that the future great market for buses is going to be through the electric railways. In time the railways are going to dominate the situation. If the manufacturers generally realize that the great market for their product is the electric railway field and find that their output is going to be taken there, they will be inclined to co-operate with the association in fostering the use of buses in non-competitive services.

Mr. Shoup expressed the view that if the manufacturers are willing to co-operate, that is very good, but there is no evidence of it yet in California. He said that much of the difficulty there has been caused by the granting of extensive credit by bus manufacturers. If they are willing to cease that sort of thing the railways will be glad to co-operate with them, but whether this is a fact is to be determined.

President Budd expressed the view that the association ought to have a continuing committee to study the whole bus situation and the best way of working out the railway problems jointly with the motor vehicle industry. The executive committee approved the appointment of such a committee and President Budd named the following members: L. S. Storrs, chairman; C. D. Emmons, F. R. Coates, Paul Shoup, A. W. Brady, J. G. Barry and M. B. Lambert.

MID-YEAR MEETING AT ST. LOUIS MARCH 4

Mr. Lambert, reporting for the special committee on date and location of the Mid-Year Meeting, recommended that St. Louis be selected as the place and Tuesday, March 4, as the date. He said that St. Louis has adequate hotel facilities, is near the geographic center of the railway field, and the conditions in St. Louis are deserving of this honor more than any other city that has not

recently been the center of an association meeting. The executive committee approved these recommendations.

President Budd requested authorization to appoint two new committees, one on city operation and one on interurban operation to cover in a comprehensive way, so that it may be disseminated to other member companies, information as to progressive operating methods and equipment, with the idea of speeding up the modernization program in the industry. A more elaborate description of the organization of these committees will be published next week.

Mr. Welsh reported that the American Committee on Electrolysis had recently met in Chicago to consider the advisability of renewing its work. The consensus of opinion was that the work should go on and a resolution was adopted authorizing Chairman Bion J. Arnold to communicate with each association having representation on the electrolysis committee and ask that it reaffirm the appointment of its representative and its intention to support the work financially. The executive committee approved the continued support of the A.E.R.A.

The executive committee discussed at some length the question of whether it should indorse the National Transportation Institute and encourage membership of electric railway companies in that organization. Bert M. Robinson of the Transportation Institute was invited to speak before the committee and he outlined its purposes and answered various questions. As there was insufficient time to give the matter full consideration and as it was realized that the proposed work is an extremely important one, action was deferred to a subsequent meeting and President Budd appointed a special committee consisting of P. H. Gadsden, C. D. Emmons, Paul Shoup, J. H. Hanna, F. R. Coates and W. H. Sawyer to give the matter further study and report back with a definite recommendation.

Mr. Emmons reported for the committee on the Charles A. Coffin prize, recommending that an award of merit be sent to each contestant whose brief contained one or more contributions of special value to the industry; that the committee give further consideration as to which companies should receive these awards of merit; that a letter of appreciation be sent to each of the seventeen companies which took part in the 1923 contest; and that the briefs be edited and prepared for possible publication in book form at the expense of the association. The executive committee approved all of these recommendations.

President Budd was authorized to appoint a special committee on arrangements for the Mid-Year Meeting.

President Hyland of the Claims Association requested approval, which was granted, to appoint a new committee of the claims association which would undertake to bring about uniform grade crossing laws.

The next meeting of the executive committee will be on Jan. 18 at association headquarters, New York, at 10 a.m.

The News of the Industry

Los Angeles After Subways Railroad Commission Holds Hearing on Projected Subway System of Pacific Electric Lines

The California Railroad Commission held a hearing in Los Angeles on Oct. 29 on the application of the Pacific Electric Railway for authority to construct a rapid transit subway in Los Angeles from its present Hill Street passenger terminal to Glendale Boulevard. The railway sought permission to proceed with its original plan to construct the subway as proposed to come to street grade at its Hill Street terminal.

The railway stated to the commission that it had expended \$800,000 for rights-of-way and had the funds in hand to proceed at once with its original plan with the view of giving relief to the congestion on Hill and Sixth Streets in Los Angeles, and for the purpose of furnishing rapid transit service between Los Angeles and Hollywood, as well as San Fernando Valley points; that the subway would take 116 interurban trains a day off of Sixth Street alone; that the work could be started immediately of digging the bore and completed within eighteen months, should the commission see fit to act favorably on the company's application.

DIFFICULTIES BEFORE CITY

As an alternative proposal the suggestion was made that the eastern terminus of the proposed subway might be diverted southward to Pershing Square. The company explained that the alternative proposal was submitted primarily to meet prevalent views that such a tunnel ultimately should become part of a general system of subways.

The city of Los Angeles in presenting its views to the commission indicated that many obstacles had to be removed before it could entertain further authorization of the terminus underneath Pershing Square. First, there were charter provisions to be met. In addition there were engineering problems to be overcome. It was outlined by the city's representative that Pershing Square would have to be excavated with steam shovels and then be remade, and if the requirements of the Park Department were met the station in the park would be 35 ft. below the street level.

It developed at the hearing that the board of engineers, representing the city of Los Angeles, the Los Angeles Traffic Commission, the Los Angeles Railway and the Pacific Electric Railway, had been unable to agree. This board was appointed thirty days ago to

endeavor to bring about an agreement regarding a comprehensive subway system for the city of Los Angeles. In the absence of such an agreement it is evident most any plan will be favored that can be carried out at once.

It is stated that any comprehensive subway system would cost the city from \$5,000,000 a mile upward with a total expense of \$100,000,000 for from 20 to 40 miles of line.

Super-Power Plant for Davenport

A super-power plant generating at least 200,000 hp., for consumption in the Tri-Cities and for long-distance transmission, will be located on the banks of the Mississippi River 2 miles above Davenport. Formal announcement to this effect has been made by B. J. Denman, vice-president and general manager of the United Light & Railways Company.

Located along the right-of-way of the Clinton, Davenport & Muscatine Interurban Railway and also along the line of the Milwaukee road, the power site will be easy of access for coal deliveries. It will also have river wharfage in case coal barge transportation on the Mississippi from lower Illinois and Ohio River mines proves practical in the future.

The first section of the new plant will be 160 x 220 ft. in ground dimensions and 110 ft. in height, of concrete and steel construction with brick exterior. The initial capacity will be 35,000 hp.

The engineering and construction work will be done by the United Light & Railways Company construction forces, the completion of the power plant and dam at Iowa City and the new power house at Fort Dodge making it possible to concentrate construction equipment and forces on the new Tri-City plant.

New Public Service Plan Not Yet Ready

Statements are unofficial which were made in the daily newspapers of Nov. 12 and 13 indicating that the Public Service Railway contemplates putting sixty buses in operation at this time in northern New Jersey. As has been indicated before, the company has in preparation a new plan looking toward unified railway and bus operation in New Jersey, but it appeared unlikely on Nov. 14 that this plan would be ready to be announced for a week or ten days. Out of terms they thought might be included in the forthcoming statement by the company, the newspapers of Nov. 12 and 13 built up and published a story that had the appearance of having been obtained from official sources.

Subway Amendment Carries Detroit Electors Approve Proposal to Permit Construction of Subway or Elevated Lines

Two charter amendments carried at the Nov. 6 election in the city of Detroit have an important bearing on the city's street railway system.

One amendment, called on the ballot the "Subway Amendment," allows the city to bond up to 4 per cent additional to all other purposes for the construction of a rapid transit system, either subway or elevated. The other amendment permits the Street Railway Commission to sell property and equipment no longer needed by the system, and requires that the proceeds from the sale of such property be reinvested in other equipment and capital assets, or that it be so applied as to reduce the street railway's bonded indebtedness. Property now held by the commission and regarded now as salable has an estimated value of \$500,000.

The Subway Amendment, which required a 60 per cent favorable vote, was carried with a margin of 7 per cent. The other street railway measure was carried by a margin of 11 per cent.

Although called the "Subway Amendment," the measure which paves the way for rapid transit in accordance with the Culver-Wilcox bill passed by the Michigan State Legislature a year ago provides also that the city may own, operate and maintain an elevated railway. Under the terms of the amendment the city is authorized to proceed with plans for the construction of a rapid transit system and to finance construction by an issue of bonds for more than \$80,000,000 at 4 per cent of the present valuation of approximately \$2,100,000,000.

Power is conferred upon the city to make an initial appropriation to plan and fix routes; to make the city's annual assessment roll show in a separate column the assessment on any property because of the subway and the assessment on any property built and acquiring its assessable value because of the subway; to exercise the power of eminent domain if necessary for the purpose of the subway; to transport therein persons and property and to construct, own and maintain, with like powers, privileges and limitations, an elevated railway.

The Subway Amendment also provides for a board of three members called the subway board, appointed by the Mayor by and with the advice and consent of the City Council. The salary provided for the members of the board is not less than \$10,000 a year each,

until the work of constructing the subway is completed, after which the board's members shall serve without pay.

Mayor Frank E. Doremus was re-elected. He received about 90 per cent of the votes cast for Mayor.

Service Changes and Jitney Regulation Recommended

John A. Beeler, reporting to the city of Houston, says that faster service, rerouting of several lines and a redistribution of cars will effect economies that will result in increasing the earnings of the Houston Electric Company. He says, however, that a complete solution of the transportation problems of Houston will be impossible so long as the jitneys are allowed to operate as at present.

The report is in two parts. One covers the details of the railway situation and the other deals with the jitney problem.

Some of the things which Beeler suggests are a few changes in present lines of the company, the adoption of all double truck one-man cars on all lines except the Liberty, the abolition of the present plan of making sixteen stops to a mile, the elimination of all unnecessary delays, more stringent regulations regarding transfers and the placing of men in the downtown districts to assist in loading and unloading passengers during the rush hours. He estimates these changes will increase the earnings to \$602,000.

Mr. Beeler states in his report that he has made a careful survey of the railway situation from every angle and that the suggestions which the report contains will tend to reduce the operating cost and increase the desire of people to ride.

On jitneys, Mr. Beeler says:

A plan successfully adopted by many regulatory bodies is to limit jitney service to territory where the railway service is inadequate and unsatisfactory.

Among other things that are desirable in order to bring about better conditions are the following: A bond of at least \$10,000 should be required of each jitney to cover personal injuries and other liabilities; loading should be limited to the seating capacity, and the matter of taxation should be equalized between the two systems.

The jitneys in nearly every case operate along the railway routes in the old settled and comparatively close-in districts. They receive 6 cents for a single short haul ride, while the railway, which serves the outlying territory, receives an average of 6.45 cents for a much longer ride, and furnishes a free transfer if desired.

The jitneys run 55 per cent faster than the street cars. Because of this saving in time the people will put up with intolerable crowding and take chances on personal injuries. The public demands rapid transportation and the railway will suffer as long as it cannot supply that demand.

Mr. Beeler says that the solution lies largely within the power of the railway. It must revamp its slow, halting service, eliminate the unnecessary stops and delays and reduce the waste in all the factors involving the time element.

The report by Mr. Beeler was made in connection with the action by the company against the city to secure greater revenues.

Old and New Side by Side in Brooklyn

A half century's advance in street railway transportation in Brooklyn was pictured on Nov. 1, when the Brooklyn City Railroad placed on public view at Borough Hall a horse car of 1868 and one of its new front-entrance, center-exit, pay-as-you-pass cars, described in detail in the issue of the *ELECTRIC RAILWAY JOURNAL* for Oct. 27, page 739.

Following an inspection at the Fifty-eighth Street carhouse by Transit Commissioner LeRoy T. Harkness and other representatives of the Transit Commission, as well as by officers of the United Railways of Baltimore, the "Brooklyn," as the new car is known to the railway industry, was run to a siding at Borough Hall.

There it was joined by the old horse car, long since discarded, and manned by John Orleman of 170 Snyder Avenue, one of the few surviving drivers of horse cars in Greater New York.

Contrast in Cars Collects Crowds

Snyder, who recently retired with "a perfect record" after forty-seven and a half years of service, wore a part of the garb and used the same whip that was a part of his equipment when, after apprenticeship as a towboy, he worked as a driver on the Flatbush Avenue line.

The oil lamps of the car of the days following the Civil War contrasted strongly with the lurid front of the 1923 car. Between the vestibule windows and bumper of the latter the dash is painted a peacock blue, and, from the headlight as the center, there radiated a series of irregular streaks, producing a weird but striking effect. The new car, built for heavy city traffic, and designed from experience in Brooklyn surface transportation, is 44 ft. long over bumpers and seats fifty-three passengers. This is said to be the largest seating capacity yet attained in a car of this size. Two of the cars have already arrived and 200 of them will be in operation before 1924.

The old car was towed from its refuge in Fifty-eight Street to be exhibited with its modern companion, from 11 a.m. to 7 p.m. Many thousands of the Brooklynites viewed the spectacle before the veteran driver conducted his charge back to the carhouse that night.

The 200 new cars, part of a progres-

sive betterment program being carried out by the Brooklyn City Railroad, represent an outlay of more than \$3,000,000. They are painted red and are trimmed with yellow. Each car costs approximately \$15,000. The cost of the old horse car which was shown in contrast to the new vehicle was about \$650.

Railway Tangle in Monterey

Transportation facilities in the vicinity of Monterey and Pacific Grove, Cal., are at present in an unsatisfactory condition. The difficult situation in which the Monterey & Pacific Grove Railway finds itself dates back to July, 1922, when the City Council of Pacific Grove brought suit against the railway praying for the annulment of the franchise. Its complaint was based upon non-payment of franchise taxes amounting to \$605 and the abandonment of a portion of line along Nineteenth Street to the Southern Pacific

Depot, about half a mile, which could not be operated at a profit. Judgment was rendered in November, 1922, in favor of the city of Pacific Grove and the company's franchise was declared forfeited.

The railway continued to operate until Sept. 11, 1923, on which date the company was served with an injunction prohibiting the operation of cars within that city. Since Sept. 11 cars have been operating from the city line of Pacific Grove through the city of Monterey to Del Monte.

The city of Pacific Grove signified a willingness to grant a new franchise provided the railway would lay new ties and rails and pave the streets for a width of 9 ft. along its right-of-way. This the company declared it could not do owing to its unfavorable financial condition and the unfair requirement of paving.

Bus operation has also played a part in the controversy. At the time the city brought suit for annulment of the company's franchise there was a bus line operating between the two cities at a 10-cent fare. The bus line failed financially twice in fifteen months. The bus line is now operating at a 5-cent fare between the business district of Monterey and Pacific Grove, but it does not furnish local service to Del Monte.

Renewal of Marietta Franchise Grants Approved

Residents of Marietta, at the election on Nov. 6, defeated the referendum petition prepared in opposition to the Monongahela-West Penn Public Service Corporation. As a result the company will continue its operations there and carry out the proposed improvements as soon as possible.

The City Council of Marietta recently passed three orders: One authorized the renewal of the interurban franchise held by the company, another renewed the franchise for railway operation in the city and another renewed the lighting franchise.

Action of the Council on these matters was questioned by some of the residents of the city and a petition was prepared for a referendum. It was this referendum which was defeated in the election. The civic clubs of Marietta were active in the campaign for the service of the company. The Rotary Club, Chamber of Commerce, Woman's Club, Kiwanis and Ad Clubs prepared advertising setting forth the probable condition of Marietta without the services offered by the company and stating the proposition which was made.

The company proposes not only to operate the railway system in the city, but to supplement this with bus service.

New York Central Seeks Electrification Details

Applications by the New York Central Railroad to the Public Service Commission for an order specifying detailed methods of electrification of its steam lines in New York City and to the Transit Commission for elimination of all its grade crossings under the general grade crossing law were made public on Nov. 11. The two applications, which were made necessary by the Kaufmann law requiring the electrification of all railroads in New York City, reopen the question of the relocation of the New York Central's tracks on the west side of Manhattan and the removal of the danger of tracks at grade on so-called "Death Avenue."

In its application to the Transit Commission the New York Central has asked that the expense of eliminating the grade crossings on its west side tracks, estimated at from \$15,000,000 to \$25,000,000, be borne one-half by the company, one-fourth by the city and one-fourth by the State, under the provisions of the general grade crossing law. By special laws, enacted in 1911 and 1917, the company is required to meet the expense of track relocation alone.

George McAneny, chairman of the Transit Commission, expressed doubt that the grades could be changed under the general statute in view of special legislation on the same subject, and said he did not believe that there would be any satisfactory solution of the west side problem or any of its phases until the railroad accepted the principle of the special acts and paid for an im-

provement from which it would derive great gain. Mr. McAneny said, however, that the Transit Commission would fix an early date for a hearing on the company's application and might unite with the Public Service Commission in a joint hearing.

The application of the New York Central to the Public Service Commission for an order specifying detailed methods of electrifying its steam lines in the city mentions as such lines its west side freight line from Spuyten Duyvil to St. John's Park and its Putnam Division. Freight trains on the Harlem Division also are operated by steam.

\$500,000 a Year More for Chicago Trackmen

Union shop and track employees of the Chicago Surface Lines have been granted an increase in wages by the arbitration board, which settled the wage controversy that resulted in a strike during the summer.

The wage increases average 8 cents an hour for the 2,200 men involved. They mean an increase in the annual payroll of the railways of approximately \$500,000.

The old and the new wages of craftsmen who will benefit by the increase follow:

	Old	New
Wreck wagon drivers (horse).....	\$5 a day	\$5.80 a day
Wreck wagon drivers (motor).....	\$5.20 a day	\$6 a day
Carpenters, per hour.....	54 to 81 cents	64 to 91 cents
Painters.....	75 to 83 cents	85 to 93 cents
Electricians.....	90 cents	\$1 an hour
Linemen.....	\$1.10	\$1.20
Blacksmiths.....	87 to 92 cents	97 to \$1.02
Armature winders.....	90 cents	\$1
Machinists.....	83 to 95 cents	93 to \$1.05
Sheet metal workers.....	85 to 90 cents	95 to \$1
Track dept foremen.....	67 cents	73 cents
Pavers.....	62 cents	68 cents
Track dept laborers.....	54 cents	60 cents
Watchmen.....	39½ cents	45½ cents
Moulders.....	81½ cents	91½ cents

The new wage agreement is for one year and is retroactive to Aug. 1, 1923. This is the second wage increase given employees of the Chicago Surface Lines this year, 13,000 trainmen and other employees receiving a 3 cents an hour increase after an arbitration hearing early in the summer.

Sum Appropriated for Engineering Education

The Carnegie Corporation of New York made an appropriation of \$108,000 recently for the study of engineering education to be conducted by a director responsible to a committee of the Society for the Promotion of Engineering Education. The resolution adopted by the corporation sets aside for the purpose \$24,000 during the present fiscal year and \$12,000 during the fiscal year 1924. W. E. Wickenden has been chosen to conduct this work. Mr. Wickenden is assistant vice-president of the American Telephone & Telegraph Company. From 1909 to 1914 he was assistant professor of electrical engineering at the Massachusetts Institute of Technology and associate professor until 1918.

Public Utility Study Courses Expanded

The Institute for Research at Madison, Wis., in co-operation with Wisconsin University, proposes to expand the study of public utilities so as to put more emphasis on research and individual instructive work.

The proposed program, Prof. Martin G. Glaeser of the Institute staff explains, has a threefold emphasis: A general liberal education; selection of courses which will provide training in method; acquaintance of student with the historical, legal, economic and factual background of the field. Professor Glaeser contends that instruction representing greater detail tends in the direction of the vocationalism and should, therefore, be discouraged. He said:

Special courses in transportation have long been an integral part of the graduate and undergraduate instruction in economics at the University of Wisconsin. Coincident with the beginning of state regulation by commissions in 1905, the work was expanded to include instruction in the field of the local public utilities.

Within the field of public utilities, opportunity can be given for a comprehensive survey course in the history and regulation of public utilities. This should include the local utilities along with railroads and national utilities generally in order to economize time and be available for those who have no interest in the work beyond its "public interest" features. This can then be followed with special courses in the administration of local utilities and railroads.

Burden of Rhode Island Wage Demand \$3,000,000

An increase of \$3,045,689 a year in operating costs of the United Electric Railways, Providence, will result, according to an estimate by the company, if the wage advance asked by the men is granted.

The additional operating expense, according to the company's statement, would necessitate a 12-cent fare, or eleven tokens for \$1, for transportation in the present zones.

Among the increases asked were the following:

Motormen and conductors from 58 cents an hour to 80 cents an hour.
Brakemen from 49.6 cents an hour to 65 cents an hour.
Trolley tenders from 28.7 cents an hour to 40 cents an hour.
Warehouse men from 49.6 cents an hour to 60 cents an hour.
Receiving clerks from 49.6 cents an hour to 65 cents an hour.
Cashiers from \$28.75 a week to \$40 a week.
Bill clerks from \$26.75 a week to \$35 a week.

An offer to arbitrate the new working agreement submitted by its employees has been made by the company to the union officials. The proposal was that the present agreement which expired at midnight Oct. 31, be continued until the arbitration board had considered the matter as presented by both sides and had then submitted its findings on the terms of the new proposal.

As was reported in the ELECTRIC RAILWAY JOURNAL, issue of Nov 10, the men are opposed to arbitration, but have renewed their request for a conference on their recently submitted draft agreement including a wage increase and the closed shop.

News Notes

Thirty-three Years Without Accident.—John Donahue, motorman, and John Murphy, conductor, of Peoria, Ill., are charter members in the "Safe Drivers Club." They have a record of thirty-three years as a railway crew without an accident of any kind. Since 1890 they have covered more than 1,250,000 miles together. They are known as the original "Safe Drivers."

Wins Paving Suit.—The city of New York has won its paving suit against the Union Railway by a decision of the Appellate Division of the Supreme Court, which rules that the company was not exempt from provisions of the law requiring street railways to keep in repair not only the space between the rails of each track, but the space between the tracks and for 2 ft. on the outside of each track. The result will be that the company will have to pay the city the cost of paving its entire roadbed area, which will amount to more than \$100,000 a year above the amount conceded by the company. The suit heard by the court involved a claim of only \$395 for work done on Melrose Avenue.

Examination Date Announced.—The United States Civil Service Commission will hold an examination on Dec. 5 to fill vacancies in the Bureau of Standards. The optional subjects for junior engineers include civil, electrical, mechanical and radio engineering.

Only Electric Trains in Tunnel.—R. H. Keays, chief engineer of the Moffat tunnel, which is to be a little more than 6 miles long, at a recent address before the Denver, Col., Civic and Commercial Association, explained that only electrically operated trains would use the Moffat tunnel and in consequence there would be no need for artificial ventilation. The work on the tunnel is going right along, both portals having been bored so far in that the winter snows will not interfere with further progress.

"At Your Service" Gives Facts.—The Virginia Railway & Power Company, Richmond, Va., has been running advertisements in the form of a bulletin in the *Times-Dispatch*, entitled "At Your Service." Bulletin No. 2 gives some facts with regard to the operation of the trolley in Richmond during September.

A "Make-Up" for the Ladies.—Every now and then the "Public Service News" published by the Winnipeg Electric Railway, will set aside an issue specially for ladies. The company says in the first number devoted to women patrons that it has endeavored to get a "make-up" as neat and as dainty as the sex to which it is addressed. A patron suggested the plan because from his observation the women were the worst offenders against speeding up service, etc. The Winnipeg Electric

Railway declares that it does not share this view, but rather thinks the women observant of principles upon which good service is built.

Honor Men Listed.—Appreciation of long and faithful service given by ten veteran employees of the Indiana Service Corporation on the city lines of Fort Wayne is expressed by officials of the company through the formation of a "Personal Service Honor Roll." The ten men have service records ranging from twenty-five to more than fifty years and all are still in the service of the company. Cards bearing the names of these employees have been placed in all the city cars, under the caption "Personal Service Honor Roll." Four of the men were in the service of the company in the days of the old horse cars.

One Day off Without Pay.—Employees of the Seattle Municipal Railway lines will have one day off in eight, under a bill introduced in the City Council by Chairman E. L. Blaine of the finance committee. The bill calls on Superintendent D. W. Henderson to rearrange schedules to permit the day off without pay. This policy was agreed on by the budget committee two months ago.

Mountain Division Electrification Report Renewed.—From official sources it is learned that there is nothing new in the report from Pittsburgh to the effect that while no final plans have been adopted for the running of Pennsylvania trains by electricity in the mountains from the Conemaugh section to Altoona, it has reached the point of a definite intention to electrify parts of the Allegheny Mountain lines on both sides of the watershed, which begins at either Galitzin or Cresson.

Tells Its Own Story.—The Vicksburg Light & Traction Company, together with other utilities, is getting out some joint publicity on the things it is doing and for what it stands in the development of the city of Vicksburg, Miss. The railway is a member of the Louisiana-Mississippi Committee on Public Utility Information and suggests that patrons keep in touch with the committee if they want information about their railway property.

Reprints Into Book Form.—The North American Company, New York, N. Y., has put into book form various articles reprinted from the *Wall Street Journal* relating to that company's activities. The pamphlet is called "An Unusual Record of Achievement." It tells all about the company's earning power, expansion, etc.

Will Call Election.—Mayor McInich of St. Joseph, Mo., will call a special election to submit the proposed railway contract for furnishing electric current to the city for lighting purposes as soon as he receives a report from the State Public Service Commission that the form of the contract, which was contained in an ordinance passed by the Council, is approved. No bond issue is involved in the proposed election.

The question will be merely whether or not the city will enter into a contract for electric current with the railway at a cost of 1.8 cent per kilowatt-hour for the first 500,000 kw., and 1 cent for all over that amount.

What Houston Is Doing.—How it served its patrons in 1891, 1901 and 1923 was shown by the Houston Electric Company in a recent advertisement in the *Houston Post* entitled "That Houston May Fulfill Her Destiny." Accompanying the pictures the company tells something of its accomplishments and aspirations. It states that from July 31, 1920, through July 31, 1923, the company spent about \$7,000,000 in the extension, improvement and operation of the railway system.

One-Man Car Service Discontinued.—The Tacoma Railway & Power Company has discontinued its one-man car operated to Clover Park from Lake City, connecting with the American Lake line. The district is now served by a motor bus, operated by the City Transportation Company. Fare on the new bus line will be 35 cents one way, with a 25-cent rate to the Lakeside Club. Cars on the south side to Murray will continue as usual.

Ford Gives Another Loan.—The Ford Motor Company has again come to the aid of the city of Detroit by recently agreeing to advance another \$2,000,000 to take care of electric railway extensions and to enable the city to meet payments on sewer work already contracted for. The recent loan brings the city's debt to the Ford company up to \$5,000,000.

Names New Director of Bureau.—The Illinois Committee on Public Utility Information has announced the appointment of Keith Spade as director of its department of public speaking, known as the Public Service Speakers' Bureau.

Better Health Among Employees.—At a meeting of the board of directors of the United Railways, St. Louis, it was brought out that there was a great improvement in the general physical condition of members of the Employees' Mutual Benefit Association. Colonel Perkins remarked that the increased care of the fellow men was beginning to bear good fruit. For a period of sixty days recently there were no deaths reported.

Chair in Transportation Endowed.—Senator William B. McKinley, chairman of the board of the Illinois Power & Light Corporation, Chicago, Ill., has presented to the University of Illinois securities yielding \$7,000 a year for the endowment of a chair in the economics of transportation.

Transit Plan Coming.—The Rapid Transit Commission at Detroit is making plans for the development of a financial and legislative program intended to further the rapid transit project. It has been announced that the commission hopes to develop a plan to finance a rapid transit system that will not be dependent for its success on the ability of the city to borrow within its present debt limits.

Financial and Corporate

Independent Receiver Sought

Holders of St. Louis & Suburban Bonds Want Road Separated from United Railways

Appointment of an independent receiver for the St. Louis & Suburban lines and segregation of those lines from the United Railways system of St. Louis are demanded by the foreclosure suit filed in the Federal court during the week ended Nov. 10 by holders of Suburban bonds on which default has occurred.

A separate valuation of the Suburban properties is demanded to determine among other things, whether the present rate of fare is too high or too low. In demanding an independent receiver the petition states that Rolla Wells, the receiver of the United Railways, is not qualified to act in that capacity for the Suburban, as he represents interests that conflict with those of the Suburban claimants.

The bondholders' committee, members of which appear as plaintiffs in the foreclosure suit, professes to represent about 80 per cent of the holdings of the \$4,500,000 issue of general 5 per cent bonds of the Suburban, which matured on April 1 last, and have not been paid. Marion C. Early and Sam B. Jeffries appear as counsel for the petitioners.

The Mississippi Valley Trust Company, trustees under the Suburban general mortgage, heads the list of plaintiffs, and the individual plaintiffs, members of the bondholders' committee, are Herman C. Stifel, A. C. F. Meyer, J. L. Johnston, John G. Longmire, Craig McQuade and A. H. Reller.

The defendants named are the St. Louis & Suburban Railway, United Railways, St. Louis & Meramec River Railroad, St. Louis Trust Company, St. Louis Transit Company, Mercantile Trust Company, trustee, American Loan & Trust Company, Boston, and Rolla Wells, receiver of the United Railways.

The Suburban lines and those of the St. Louis & Meramec River Company, which are involved with them in the present proceedings, are the present Hodiadmont, Sarah and Union lines of the United Railways, that part of the Manchester lines west of Sarah Street, and the Maplewood-Meramec, Kirkwood-Ferguson and Florissant lines in St. Louis County.

These lines, the petition states, form 15 per cent of the United Railways system, and furnish more than 15 per cent of its revenue, while their bonded indebtedness is less than 12 per cent of that of the entire system. The Suburban and Meramec lines were absorbed Dec. 31, 1906, by the United Rail-

ways, which thus obtained a complete monopoly of railway transportation in the city and St. Louis County.

The petitioners allege that in 1917 the United Railways charged \$638,279 against depreciation reserve on account of two power plants of the Suburban which were closed without rendering any account of the proceeds of their disposition. This amount, it is alleged, was less than the Suburban lines' share of the United Railways depreciation reserve for that period. The petitioners say this reserve should have been at least \$850,000, and the court is asked to order Receiver Wells to pay that sum, or a sum fixed by investigation, to the new receiver.

It is charged that the United Railways has operated the Suburban property to the profit of the entire system, rather than to that of the Suburban lines, and that this has been detrimental to the interest of the Suburban bondholders. A separate valuation was asked three times, the petition states, but was opposed by the company and the receiver.

The petition says the Suburban lines are capable of being administered independently of the United Railways, and for that purpose, it asks that Receiver Wells be ordered by the court to turn over to the Suburban the rolling stock and other equipment which it will need, and to furnish the needed power at cost. This can be done, it is stated, without detriment to the United Railways system.

Sam B. Jeffries, attorney for the Suburban group, gave out this statement:

We have a mortgage on the best producing portion of the United Railways. Our interest on the mortgage is unpaid, and we are asking for our property, so that we can make it produce for us.

The old Suburban lines were the biggest of the lines that went into the United Railways, and had the greatest potentialities. For instance, the Broadway, the Olive and the Cass lines served a community whose needs were already known. But the Suburban lines served growing communities—Florissant, Ferguson, Maplewood, Webster Groves, Kirkwood and the like—all needing development of the car service.

The report of James E. Allison & Company, consulting engineers, shows that while the underlying bonds and mortgage total only \$6,500,000, the minimum value of the physical properties is \$7,500,000. We have a mortgage on a real paying property, and we want our money, or a chance to get it.

Receiver Will Show Railway's Worth.

—The Norwalk-Shelby traction line, placed in the hands of a receiver on Nov. 3, will have a chance to prove its worth, according to Receiver E. G. Martin. Freight-carrying equipment will be added to the line and arrangements have been made with the Ohio State Power Company, Tiffin, to continue to deliver electricity to the power customers of the company by way of Plymouth.

Net Up \$93,802

Third Avenue Railway, New York, Reports Gain for Year Ended June 30

For the fiscal year ended June 30, 1923, the operating revenue of the Third Avenue Railway System, New York, was \$14,406,784, an increase of \$265,371, or 1.88 per cent, as compared with the fiscal year ended June 30, 1922. The operating expense for the year ended June 30, 1923, was \$10,726,984, an increase of \$171,957, or 1.63 per cent, as compared with the previous year. The net income for the year recently ended was \$301,276, an increase of \$93,802 over the previous year.

The property earned during the fiscal year a fraction more than 6 per cent on the 5 per cent adjustment bonds and the directors authorized two interest payments of 3 per cent each, making 6 per cent for the year. Five per cent was for the current interest and 1 per cent a payment upon the accumulated interest on these bonds. There remains as interest still unpaid upon these adjustment bonds 20½ per cent.

Slaughter W. Huff, president of the company, explains that there has been some misunderstanding as to the amount that is available for payment of accumulated interest on these bonds, due to the fact that all the company's cash or its equivalent in securities has been carried heretofore in the current assets account without reference to the amounts that were due to depreciation and contingencies and other reserve accounts. With the report for the year recently ended there was submitted a balance sheet which shows cash or securities to the amount of the depreciation and contingencies account so set apart that current assets the company has available for general purposes may be readily distinguished. Mr. Huff says it will be seen that these assets are not more than are necessary for the safe operation of the companies and the protection of the stockholders' interest in the property. He says

Your directors believe that sufficient cash or its equivalent should be kept available at all time for the purposes of the company, and that the surplus that has been already created should be maintained for the protection of the property. They have, however, paid out in interest on the adjustment bonds, approximately all that has been earned during the last two years, 5 per cent being paid last year and 6 per cent this year.

After the reorganization of the Third Avenue Railway in 1912, 20 per cent of the gross receipts of the companies of the system was set aside for maintenance of the property, depreciation and contingencies. Under the low costs of labor and material prevailing prior to the war, this provided for the maintenance of the property and created a depreciation and contingency fund, which was invested in the securities of the company as follows: \$2,022,498 Third Avenue Railway first refunding 4 per cent bonds, \$254,388.97 Third Avenue Railway 6 per cent adjustment bonds.

With the high cost of labor and material prevailing during the war and since, it was necessary to increase this percentage of gross receipts for maintenance, depreciation and contingencies from 20 per cent to 25 per cent, and during a portion of the time it required the entire 25 per cent to maintain the property or to take care of deferred maintenance, but there have been

CONSOLIDATED STATEMENT OF INCOME OF THIRD AVENUE RAILWAY SYSTEM FOR YEARS ENDED JUNE 30, 1923 AND 1922

* Deficit.		

periods in which a substantial part of the 25 per cent went into the depreciation and contingency account. During the past year, about \$750,000 passed into that account, partly due to the fact that it was difficult to secure sufficient labor to carry on the maintenance work, and partly to the fact that it was not believed to be economical to perform under present costs maintenance work that might be deferred to a more favorable time for the purchase of material and employment of labor, and when the money could be expended more economically for maintenance work.

It is important that a depreciation and contingency fund be created and that actual cash or its equivalent be set aside to cover this account, not only because of the necessity for actually purchasing from time to time additional equipment to replace that which has worn out or become obsolete, but because it would seem particularly desirable to have a cash fund available from which to borrow, in order to cover the actual cash expenditures that have to be made under capital account.

So long as accumulated interest on the adjustment bonds remains unpaid, the company is not permitted to acquire or construct additional lines, for which additional capital might have to be issued. It is necessary, however, in order to operate lines already owned or controlled, that from time to time expenditures should be made on account of additions to capital. Under the present conditions, these expenditures must of necessity be taken care of out of the surplus of the companies, or borrowed from its depreciation and contingencies fund.

The increased actual physical property of the companies, upon which they are entitled to increase their capitalization, is an offset against the depreciation of the property that has already taken place, or is to

take place, and it is perfectly legitimate to borrow from the depreciation and contingency account, in order to meet the requirements of the capitalization account. It would seem under present conditions that this would be a wise procedure and for the best interests of the security holders of the companies.

At any time that conditions might be favorable, additional securities can be issued for the capital account, and the depreciation and contingency account reimbursed for the funds borrowed from it, while for the present the properties are saved the great sacrifice that would result from an effort to market securities under present conditions.

If the issuance of additional securities can be avoided, with the increase of gross receipts that must result from the growth of the territory of the companies, the financial position of the company should be greatly strengthened, regardless of any temporary setbacks that may come due either to increases in the cost of labor and material, or to the temporary loss of receipts.

Northern Massachusetts May Suspend in December

By a decree of Judge Charles DeCourcy of the Massachusetts Supreme Court, set forth at a hearing in Boston on Nov. 9, service on the Northern Massachusetts Street Railway may cease on Dec. 31 next, either on the whole of the property or upon such portion or portions as the receiver, Daniel P. Abercrombie, shall deem wise, with the written consent of trustees under the mortgages.

The course authorized on the Connecticut Valley system, controlled by the same interests and having the same receiver, was left to be determined at a continued hearing on Nov. 16. The probability is that some of these lines will cease operation on Dec. 31 and that all of them will stop by March 31, unless sales are made enabling some of the lines to be run by other interests.

In the case of the Connecticut Valley lines, which serve Greenfield, Northampton, Deerfield, Turners Falls, Amherst and other points, sale by foreclosure has been generally agreed upon as most desirable. Provisions for immediate needs of the Northern Massachusetts are covered in the court decree, which authorizes the borrowing of \$15,000 on receiver's certificates and the renewal of \$25,000 in outstanding certificates.

Revaluation of Rochester Lines Sought

The city of Rochester has opened proceedings for the review of the valuation of the Rochester lines of the New York State Railways under the service-at-cost contract with the service of summons and complaint upon the railway. The city sets forth that the valuation of \$19,216,000, fixed by the appraisal under the contract, is excessive and predicated upon war-time values.

This action, it is expected, will be tried before the December equity term of the Supreme Court.

President Hamilton of the New York State Railways maintains that the revaluation will show the lines to be worth in excess of the figures set by the appraisal, under which the revenues are now determined.

Purchase of Seattle & Rainier Valley Property Discussed

Possibility of ultimate purchase of the Seattle & Rainier Valley Railway system by the city of Seattle to put Rainier Valley residents on a parity with the rest of the city in fares was discussed informally recently when John C. Higgins, counsel for the company, appeared before the City Council street committee to ask that body to recommend repeal of an ordinance passed recently requiring the company to pave its right of way in Rainier Avenue between Graham and Morgan Streets. The company has pending before the franchise committee of the Council a request for relief from its franchise obligations to pay the city a percentage of its gross revenue as a franchise tax and to carry policemen, firemen and city officials free on its lines. Mr. Higgins said if the company was relieved of these burdens, it would not be able to continue the recent fare adjustment, which put the Rainier Valley patrons on a parity with the Seattle Municipal Railway patrons. While Mr. Higgins suggested that the city might eventually buy the lines as the only means of assuring the same treatment for residents of the section as for other parts of the city, he made it clear that his informal suggestion was not an attempt to open negotiations with the city for merging the line with the Municipal Railway.

Large Payment Made at Montreal on Account of Accumulations

J. F. Saint-Cyr, chairman of the Montreal Tramways Commission, has sent a check for \$303,745 to the city, covering city rentals for the quarter ended Oct. 1, amounting to \$125,000, the balance to serve against the arrears. This is the first check forwarded covering the present fiscal year payments, the fiscal year of the company being from July 1 to the succeeding June 30. It is with only one exception the highest amount paid on this account since the present contract came into force on Feb. 9, 1918.

Paragraph 4, of Article 92, of this contract, dealing with city rentals, reads as follows:

The city shall receive out of the gross revenues over and above all other amounts to which it may be entitled under this contract or otherwise the sum of \$500,000 per annum during the continuation of this contract, payable quarterly.

During the period from Feb. 9, 1918, to Feb. 12, 1921, the company was unable to pay anything to the city on account of city rentals from its gross revenues, and the quarterly amount of \$125,000 consequently grew into a considerable amount of arrears.

On Feb. 12, 1921, the gross revenues were such as to permit the sending of a check to the city for rentals amounting to \$61,090. During the succeeding month another check was mailed on the same account, amounting to \$170,985.

Four payments were made during 1922, as follows, Jan. 27, to the amount

of \$182,468; April 27, \$195,915; Oct. 3, \$260,748; Nov. 27, \$318,720.

Four payments have now been made during 1923, as follows: Feb. 12, to the amount of \$382,741; May 5, \$106,656; August, \$81,033; October, \$303,745.

Total payments to date under the present contract on account of city rentals amount to \$2,064,106. The total amount owing to the city on this account from the beginning of the contract to Oct. 1, 1923, was \$2,817,694. The balance still owing to the city is therefore \$753,587.

These payments on account of city rentals do not include sums paid to the city by the company for taxes and snow removal. During the fiscal year ended June 30, 1923, the company paid in taxes to the city the sum of \$229,629, and in snow removal the sum of \$190,800. The latter is half of the total cost of snow removal in the city on the tracks. The amount of \$889,151 was paid to the city during the 1922-1923 fiscal year for city rentals, this being 10.86 per cent of the gross revenues.

A Good Year for Aberdeen's Cars and Buses

Despite greater unemployment in Aberdeen, the report of William Forbes, general manager Tramways Department, shows that for the year ended May 31, 1923, the management gave more service and earned more net than in either of the two years preceding. The changes in the railway end compared with the year before were: Gross earnings up from £184,618 to £184,868; operating expenses down from £137,979 to £133,614; net, before interest, sinking fund, depreciation, renewals and special expenditure, up from £46,639 to £51,254; surplus down because of exceptional payments from £15,089 to £8,663. The motor bus division grew from £11,650 gross to £12,557. But operating expenses fell from £8,443 to £8,224, increasing the net before fixed charges from £3,207 to £4,033. After payment of interest, sinking fund and special expenditures, there was left a balance of £1,257 (compared with £771 the year before) for renewal and reserve accounts.

One-third of the railway division's surplus of £8,663 was, by ordinance, turned over to the fund called "Common Good and City Improvements."

The double-deck street cars standard in Aberdeen ran 2,399,742 car-miles for 41,142,504 passengers, giving a density of 17.14 passengers per car-mile. In the preceding year service was less liberal, as only 2,252,889 car-miles were run for 41,087,388 passengers, a density of 18.23 passengers per car-mile. Of course, these high density figures are caused by the zone-fare system. More than 30,238,000 persons rode at 1d. although the fare scale ranges from 3d. to 3d. As the motor buses are single-deckers and in use on poorer routes, they do not show the same densities, although far higher than Ameri-

can bus routes of like characteristics. The bus routes carried 1,805,279 riders with 169,353 bus-miles, a density of 10.66, which compares as follows with the preceding year 1,646,672 riders, 157,807 bus-miles and 10.43 density.

Street car earnings averaged 18.37d. per car-mile from an average fare of 1.07d. and buses averaged 17.33d. per bus-mile from an average fare of 1.51d. Car operating expenses were 13.36d., leaving 5.12d. to overhead; bus operating expenses were 11.65d. and assigned interest and sinking fund charges 3.93d. per mile.

Ottawa Company Earning 7.74 per Cent Return

Figures on the earnings of Ottawa Electric Railway for the present year have been made public in connection with the negotiations between the company and the city of Ottawa for a straight 5-cent fare and extensions to the company's system. According to the *Canadian Financial Post* the figures indicate that for the first eight months of the present year the gross passenger revenue declined \$40,069, as compared with the first eight months of 1922.

The compilation of the return on the company's plant investment indicates a yield of 7.74 per cent during 1922 obtained as follows:

Capital additions	\$88,730.43
Allowance for engineering, etc.	9,760.34
Total annual additions	\$98,490.77
Total investment at end of period ..	4,076,499.47
Less one-half capital additions	49,245.38
Average investment	\$4,027,204.09
Working capital	80,000.00
Average investment and working capital	\$4,107,204.09
Net return available 1922	317,826.01
Per cent return 1922, ...	7.74

Income Lower—Passengers Increase in Louisville

During the nine months ended Sept. 30, 1923, the number of passengers carried on the Louisville Railway totaled 73,102,434. This represented an increase of nearly 5,000,000 over the corresponding period in 1922. The revenue derived from these patrons, however, was not so great as last year, due to a fare rate reduction through the sale of 6-cent tokens used by about 80 per cent of the passengers carried. The total revenue from transportation was \$3,182,417, a decrease of \$135,834 compared with the same period of last year. The decrease in operating revenue was offset by operating economies effected, which resulted in reduction of expenses for the nine months of 1923 by \$46,416. Operation of all these factors has resulted for the first nine months of this year in a reduction of the barometer fund from \$350,000 to \$238,571, after the payment of all expenses, fixed charges and full accrual of dividends, as provided by the ordinance. It is expected that October operations will further reduce the amount of the fund by \$10,000, according to a statement by President Barnes. He fur-

ther stated that if the barometer fund could, by operating economy and by increased riding, be brought to the sum of \$500,000, the fare would under the terms of the ordinance be reduced to 6 cents straight.

Long-Term Bonds Offered.—A syndicate headed by E. H. Rollins & Sons is offering at 98½ and interest to yield more than 6.10 per cent, \$5,000,000 of the Illinois Power & Light Corporation first and refunding mortgage gold bonds, known as series "A," 6 per cent, thirty years. The bonds are dated April 2, 1923, and are due April 1, 1953. The bonds are secured by direct mortgage or collateral lien on properties appraised at a value substantially in excess of the total debt and are a direct first mortgage or lien free of prior encumbrance on properties, including some of the most important power and light properties of the system.

New Director Elected.—Irving T. Bush has been elected a director of the Brooklyn City Railroad to fill a vacancy.

Property Sold.—The property of the Northwestern Electric Service Company, which operates a trolley and lighting service between Erie and Meadville, was recently sold to the Penn Public Service Corporation of Johnstown, Pa. Last May the Penn Public Service Corporation, acquired the stock of the Erie Lighting Company and the acquisition of the Northwestern stock is part of a far-reaching plan on the part of the Penn company to extend its power and lighting properties throughout the state of Pennsylvania from the Maryland line in the south to Erie in the north. Purchase of the Northwestern Electric stock was made through the Venango Public Service Corporation.

Five-Year Gold Notes Offered.—The Salt Lake & Utah Railroad has announced the offering of a new issue of \$150,000 of five-year 7 per cent secured gold notes. The issue has been purchased by the Palmer Bond & Mortgage Company and E. H. Rollins & Sons. The notes, offered at 99 and interest to yield 7½ per cent, are secured by deposit with a trustee of \$200,000 of Salt Lake & Utah Railroad's 6 per cent first mortgage bonds. A feature of the notes is that they are convertible into first mortgage bonds prior to Oct. 1, 1925, at 89; thereafter the conversion price advances 1 per cent each year until maturity of the notes, Oct. 1, 1928. The proceeds of the notes are to be used by the railroad to cover the cost of additions and improvements along its line, chief among which are tracks and sidings at the new Columbia Steel Corporation's plant near Provo, Utah.

Payment Made.—The May 1, 1923, coupons pertaining to the Dayton, Springfield & Urbana Electric Railway's first mortgage 5 per cent thirty-year gold bonds due Nov. 1, 1928, were paid Nov. 1 last at their face amount, together with six per cent interest.

Traffic and Transportation

Ten-Cent Fare Justified

Report of Engineers Confirms President's Statement that Davenport Company Must Have Relief

That the relief plan recently proposed to the City Council of Davenport by President B. J. Denman of the Tri-City Railway of Iowa is justified, including a 10-cent fare and a drastic rerouting plan, is the finding of an audit filed with the city on Nov. 8 by Burns & McDonnell, engineers.

The report bears out the arguments submitted by Mr. Denman when he told the City Council that unless some financial relief was granted his company it would be forced to discontinue transportation service. The engineers find the company is entitled to a 10-cent fare; that track abandonment and rerouting as demanded by the company are justified; that the company cannot take care of the depreciation of its property and pay a proper return under the present rates and operating expenses, and that charges made to operating cost are more than fair, the United Light & Railways Company, the holding concern, having been of decided service to the local company.

The investigator for Burns & McDonnell was R. L. Baldwin. Present valuation of the company's property in Davenport is \$3,257,519, this figure being as of Aug. 31 last. The auditor's report substantiated figures used by Mr. Denman in his relief demands, he having used approximately the same valuation figure; in fact, basing his figure not on the company's own valuation estimate but on an extension of a previous valuation figure arrived at by Burns & McDonnell when employed by the city of Davenport in 1920.

The total revenue for the twelve months ended Aug. 31 was \$754,106 and for 1922 \$752,415. Operating expenses for the twelve months ended Aug. 31, 1923, are \$600,603 and for 1922 \$602,581.

The report allows the company 31 per cent for depreciation and 7 per cent for return on investment. This year the company has made only 4.72 per cent, according to the report. Last year it made 4.70 per cent. In 1917 a 7.70 per cent return is indicated. Since then the company has been unable to make both ends meet.

One-Man Cars Under Fire

Agitation has been renewed against the use of the one-man car in Massachusetts. Employees are circulating petitions which have for their purpose the doing away with these cars. If present indications are any criterion the prospect is that the question of the continued use of these vehicles will be a matter for legislation at the coming

session. The legislation asked in the petitions now being circulated provides that one-man cars shall be forbidden, and that communities where they are operated may vote whether to apply the law to themselves. Platform men everywhere are making a talking point of the fact that the Public Utilities Commission overruled the efforts of the City Councils of Worcester, Cambridge and some other towns and cities to eliminate one-man cars.

Asked for an expression of opinion on the matter Clark V. Wood, president of the Springfield Street Railway, is reported to have said:

The public may have to choose between one-man cars and no service, and the trolley-men may find they have killed the goose that lays their golden egg. If the companies cannot carry the costs of two-man cars, and are forbidden by law to operate one-man cars, there may not be any trolley jobs at all for the men.

You cannot legislate against economic laws. On many lines the introduction of one-man cars enabled service to be maintained, when the costs of operation had endangered the continuance of service.

Posts Abolished in District of Columbia

Fixed posts to guard street car safety zones in the District of Columbia have been abolished by order of the Public Utilities Commission on the ground that they constitute a menace to vehicular traffic.

Four sets of these posts were installed in the business district of Washington as an experiment, two being on lines of the Washington Railway & Electric Company and two on lines of the Capital Traction Company. The system consisted of iron posts imbedded 2 ft. in concrete and standing 4 ft. above the street level, set 25 ft. apart to mark a street car loading station and protect passengers. The posts were painted white, with black stripes, for visibility and were marked by oil lanterns with red globes at night. They were removable so that the streets might be cleared for parades and similar uses.

A series of accidents resulting from motorists driving into the posts, mostly at night, caused public attention to be centered upon the experiment, which was tried for an experimental period at the direction of the Public Utilities Commission.

The order of the Utilities Commission directing removal of the posts, for which painted lines have been substituted, brought a protest from the Capital Traction Company on the ground that no hearing on the subject had been granted. The letter called attention to the fact that while removal of the posts might benefit motorists it left passengers exposed to the hazards of street traffic while attempting to board or leave cars.

2,700,000,000 Passengers a Year

456 Rides per Person per Year Is the Record in New York—Surface Lines Carry 40 per Cent

Nearly 2,700,000,000 revenue passengers were carried last year upon the surface, subway and elevated lines of New York City. This traffic was divided almost exactly, 60 per cent to the rapid transit groups—elevated and subway lines—and 40 per cent to the surface lines. The total traffic, 2,681,206,755, represents an increase of 90,893,027 passengers over 1922, each fare that was paid being computed as a passenger carried.

The rate of growth in the fiscal year 1923, however, was slightly less than last year, when nearly 8,000,000 more passengers were carried. The percentage of growth in 1923 was 3.51 per cent, as against 3.95 per cent in 1922. Whereas last year more than three-quarters of the increase was upon the surface lines, in the fiscal year 1923 the condition was almost exactly reversed, the rapid transit line increase being 72,122,104, as against 23,919,193 upon the surface lines.

The figures just quoted were compiled by the New York Transit Commission. They cover the fiscal year ended June 30 last. While the returns have not yet been fully checked, awaiting the final compilation of the figures from the annual reports of the companies, the ultimate figures will not show a variation of more than a few thousand passengers, at most, from the present calculations. The traffic upon steam railroad and omnibus lines is not included.

While the general traffic increase for the year was 3.51 per cent, the traffic has increased more than 30 per cent since the fiscal year 1919, in which year the 2,000,000,000 mark was passed for the first time. A part of the increase in traffic was due to the increase in the habit of riding by New Yorkers. To-day the average New Yorker takes ten times as many rides in a year as he did in 1860. In the latter year, the first of which there is any competent record, the average number of rides was 43. In 1923, based upon an estimated population of 5,875,996, each New Yorker rode 456 times. He rode 448 times in 1922 and 437 times in 1921.

Both the increase in the riding habit and the gross increase in the traffic are indicative of the need for new facilities as fast as they can be provided. Twenty years ago, a year before the first subway was opened, the billion mark in street railroad traffic was passed for the first time. Three years later traffic had grown 25 per cent, to a billion and a quarter. In the seventeen years since, the traffic has more than doubled. While rapid transit facilities have increased in capacity in that period by the building of new subways and the extending and third-tracking of the elevated railroads, the surface car track mileage

STREET RAILWAY TRAFFIC IN NEW YORK CITY, 1921-1923

Number of Revenue Passengers (Cash Fares)

	Fiscal Year Ending June 30—			Increase* of
	1921	1922	1923	1923 over 1922

* Prefix D indicates decrease.

has tended to decrease steadily. As the commission has repeatedly pointed out, more rapid transit lines are urgently needed if adequate provision is to be made for the growth in traffic. With the growth in traffic has grown the length of ride, the latter being to a certain extent responsible for the former. Where people used to walk they now ride, because in most instances it is no longer possible to walk the distance between work and home. As the commission sees it surface cars and bus lines, while playing a highly important part in short-haul transportation and in feeder traffic, are becoming less and less a factor in the solution of the long-haul transportation problem.

The traffic upon the Hudson & Manhattan tubes, while largely a traffic into and out of New York rather than a traffic within the city, is nevertheless included in the gross figures. The following table shows the traffic of all the lines,—subway, elevated and surface,—operated in certain years, with the increases in each year, including figures of the Hudson tubes for the years in which those lines have been operated:

Year Ended June 30	Number of Revenue Passengers	Annual Increase
1903	1,000,767,483	61,777,519
1906	1,251,841,173	120,838,479
1910	1,531,262,914	128,845,272
1913	1,709,876,508	88,962,573
1916	1,898,735,615	91,102,489
1918	1,975,482,316	56,670,087
1919	2,079,944,297	104,461,981
1920	2,365,587,369	285,643,072
1921	2,491,909,178	126,321,809
1922	2,590,313,728	98,404,550
1923	2,681,206,755	90,893,027

One of the outstanding features in the traffic statistics of the year was the fact that the tremendous traffic loss was halted which began on the Manhattan elevated lines of the Interborough Company in 1921, and these lines showed a very slight gain, amounting to 7,484 passengers over last year. The total Interborough elevated figure, however, is still far below the 1921 figure, 1922 having shown a falling off of more than 25,750,000 elevated passengers from the previous year. In 1921 the Manhattan elevated carried about 374,500,000 passengers, while last year and this year the figure was about 348,500,000, the

exact figure for this year being 348,524,700. The change in regard to the Interborough elevated traffic is generally presumed to be due to the campaign which that company made to build up this traffic, resulting in increased service and in the repainting of cars and stations a taxicab orange. The statistics show that just about the time this campaign started the loss in traffic which had been continuing into the current fiscal year, was halted, and there was a prompt gain.

Still another feature of the traffic year was the increase in riding upon the Interborough subway. During the fiscal year 1922 the gain upon the Interborough's underground system was only a little more than 5,500,000 passengers, losses being noted upon practically all parts of the system except upon the two main trunk lines through Manhattan. This year, however, the Interborough subway traffic was 676,650,431, a gain of 31,674,957. The Interborough traffic, therefore, was more than the whole traffic upon all lines in the city of New York thirty years ago.

Another outstanding feature of the report for the year was a falling off in trolley traffic in Manhattan of 5,148,270, as against a gain last year of 4,229,743. The exact cause of this change is not determinable, but it is probable that the elevated railroad traffic campaign drew a large number of riders from the surface cars, as with the growth of vehicular traffic in the street, the difficulty of maintaining trolley schedules is constantly increasing. The loss, however, in trolley traffic in Manhattan is a small figure when compared with the aggregate of this traffic, and does not mean any material falling off, being in fact larger than in any other recent years outside of 1921 and 1922, and higher than in any other period in the history of such railroad operation in Manhattan, with the exception of the four years 1913 to 1916, inclusive, which were the banner years of trolley operation in Manhattan, the figure of total traffic being for each of the four years well over 400,000,000.

The Brooklyn trolley gain for the year was 17,590,624 in a total traffic of 490,128,692. The figure of gain for the year previous, however, nearly 54,500,-

000, was abnormal, due to the splitting up of lines and the collection of added fares thereby, together with an abnormally low traffic, due to street car strikes in a part of the previous fiscal year. The Bronx, with a gain of 4,461,261 in a total trolley traffic of 119,140,781, shows a somewhat reduced rate of gain from the previous year. For the Borough of Queens, in a total trolley traffic of 59,852,694, there was shown a gain of 1,026,243, which was also less than last year, but appreciable. Trolley traffic in Richmond Borough, which showed a rather abnormal growth last year, in 1923 went back to its practically normal rate, with an increase of 841,065 in a total traffic of 19,408,180. The total traffic upon the rapid transit lines was 1,609,466,911, and on the surface railroad lines 1,071,759,844.

Estimated upon the basis of 340 average traffic days in the year,—account being taken of lighter traffic on holidays and Sundays,—the total increase in 1923 would mean that 267,000 more persons each day rode upon the subways, elevated and surface car lines of the city than rode upon a similar date in the year previous. As a matter of fact, however, the rate of increase is known to be far higher at the end of the year than at the beginning, and it has been estimated that about 2,500 more persons ride upon these lines on a particular day than rode upon the day previous. Using the same divisor of 340, the daily total traffic averaged last year 7,885,900 passengers; but again taking into consideration the fact that traffic is higher at the end of the year than at the beginning, the figure was probably well over 8,000,000 at the end of the fiscal year.

Despite the slight net gain for the whole Interborough elevated system, there was a net loss of traffic upon two of its principal lines, the Third Avenue and Sixth Avenue. However, where last year the loss upon the Third Avenue line was nearly 8,000,000, the drop this year was less than 150,000. On the Sixth Avenue line last year, which suffered a loss of 10,750,000 in traffic, the loss this year was about 1,100,000. The Second Avenue and Ninth Avenue lines which, together, last year lost 7,000,000 passengers, this year both showed a gain amounting to more than 1,250,000 passengers. On the Interborough's underground system, passengers carried on the Lexington Avenue trunk line were 202,600,000 in number, or 8,400,000 more than last year, while on the West Side trunk line, with 199,600,000 passengers, there was a gain of 12,200,000. With the exception of the West Farms branch, which lost about 400,000 passengers, and the stations in downtown Brooklyn, which dropped back about 275,000, practically all branches of the Interborough subway system showed gains. There was a gain of 5,000,000 passengers on the Jerome Avenue branch; of 2,500,000 on the Eastern Parkway branch, and of 1,600,000 on the Queensboro subway.

The Broadway subway of the B. M. T.

system continued to be one of the great traffic gainers. Last year it had a traffic of a little less than 109,000,000, and this year of 119,000,000, a gain of nearly 10,200,000. Other lines in the Brooklyn system which showed big gains were the Brighton and Fourth Avenue subway lines and the Lexington Avenue elevated, which each gained about 3,000,000 passengers; the Fulton Avenue elevated, which gained some 2,500,000 passengers; the West End line, with 2,000,000 passengers; the Culver, Sea Beach and Myrtle Avenue lines, with 1,000,000 passengers each, and the Canarsie and Fifth Avenue elevated lines, with 500,000 each.

The accompanying table shows the street railway traffic in New York for the three years 1921 to 1923, inclusive.

Ordinances Introduced to Prohibit Jitneys in Gadsden

An ordinance has been introduced before the City Council of Gadsden, Ala., designed to put the jitneys out of business. The ordinance prohibits the operation of the jitneys on streets over which electric railway cars are operated. If the jitneys cannot be operated over streets where car lines run the jitneys will be forced out of business. This ordinance will come up before the City Council for final passage on Dec. 1. Officials of the Alabama Power Company, which operates in Gadsden say the buses and the jitneys are getting so much of their business that the operation of the cars is unprofitable.

Alabama City and Attalla, two good-sized towns, are located within a few miles of Gadsden. These two towns are connected with Gadsden by street cars, buses and jitneys. Officials of both Attalla and Alabama City are discussing the probability of passing ordinances similar to the one now before the City Council of Gadsden. Should these ordinances be adopted it would prevent the operation of buses and jitneys on the paved highways entering these three cities.

Different Rates Sought in Pensacola

Jack G. Holtzclaw, receiver for the Pensacola Electric Company, has filed a petition with the Florida Railroad Commission asking for a readjustment of passenger and freight rates. The petition leaves the rate entirely to the commission to decide. In the petition Mr. Holtzclaw says that the railway loses on an average of \$55 a year in fares on every privately owned automobile in its territory.

Vote Against One-Man Cars.—At a recent election in Dayton the people voted in favor of an ordinance requiring two men on every car. The Oakwood Street Railway, the Peoples Railway and the Dayton Street Railway have been running one-man cars.

Why the Trackless Trolley?

The trackless trolley is said to have made a hit. But why not the bus without the trolley poles and overhead wires?—Philadelphia "Evening Bulletin."

The trackless trolley is primarily the forerunner of extended trolley service and, by utilizing the electrical distribution system, can be operated by means of street car motors at a cost sufficiently lower than that of the gasoline motorbus of similar size closely to approximate the difference between the trackless trolley fare of 7 cents—four tickets for 25 cents—and the 10-cent fare which is necessary to support operation of the gasoline motorbus when supplying similar service.

—Philadelphia Rapid Transit Co.

Will Supplement Service with Buses.

—Service given by the Jacksonville Traction Company will be supplemented by buses, according to a recent announcement of J. P. Ingle, general manager of the company. It is planned to replace the line on Oakland Street with buses as a start, and if this service proves successful similar service will be established in other sections not now served by the railway. For sometime the city has been seeking the extension of the railway line to the electric light plant and municipal docks, but the necessary cost would be prohibitive, according to Mr. Ingle. The regular 7-cent fare now in effect on the railway line will prevail on the buses and transfer privileges will remain as at present.

Winter Rates in Effect.—Winter rates on the Oregon Electric Railway, operating between Portland, Ore., and Willamette Valley points, became effective Nov. 12. Under the new tariff, which affects week-end and fifteen-day round trip tickets, the fare from Salem to Portland will be increased from \$2 to \$2.30, the fifteen-day ticket from \$2 to \$2.50, the week-end fare, Eugene to Portland, \$5.30 instead of \$4.90, and the fifteen-day rate \$6 instead of \$5.80.

No Jitneys in El Paso.—Following the opinion of Judge Stewart Berkshire of the Corporation Court declaring the jitney ordinance invalid because it did not specify both a maximum and minimum penalty for violation, the City Council under the emergency clause passed a new ordinance at the same time repealing the older one. After this ruling jitneys ceased to run. One jitney driver did operate but was arrested and fined. His case is now on appeal in the higher court. With this exception no jitneys have been run in El Paso since April 30 of this year. This brings up to date the status of the jitney situation, which was referred to in the ELECTRIC RAILWAY JOURNAL, issue of Oct. 20, 1923, page 723.

Improved Service Provided.—J. M. Barry, division manager of the Alabama Power Company, recently submitted to Mayor Gunter of Montgomery a proposal for the rerouting of the Montgomery Street Railway system. The proposal includes transfer privileges between depot cars and other cars so that passengers could travel on the cars between the Union Station and all other parts of the city.

Will Consider Results of Referendum.

—A post card referendum is to be started in Milwaukee. Post cards on the desirability of continuing motor bus service in the Eighteenth Ward will be sent to all owners of property on the streets where the buses of the Milwaukee Electric Railway & Light Company are operated. The results of the referendum will be placed before the Common Council for consideration.

Anti-Jitney Ordinance Before Court.

—The case of E. C. Waid against the city of Fort Worth, Tex., on appeal before the Court of Civil Appeals, involving the validity of the anti-jitney ordinance enacted by the city of Fort Worth has been set for hearing before the court. This particular ordinance as passed makes it unlawful for jitneys and other vehicles carrying passengers for hire in opposition to the traction company to operate on certain specified streets, the specified streets being the downtown business district. Enforcement of the ordinance would put the jitneys in Fort Worth out of business.

Fare Reduction Sought.—A reduction in fares at Savannah, Ga., to 5 cents is being sought by the city. A resolution asking for the reduction has been adopted by the City Council, and the Mayor of Savannah will present it to officials of the Savannah Electric & Power Company. The present rate is 7 cents. If the company refuses voluntarily to grant the request, the resolution authorizes the Mayor of Savannah to appeal the matter to the Georgia Public Service Commission.

Hears Five-Cent Fare Claim.—The city of London, Ont., has questioned the right of the London Street Railway to charge the 5-cent fare that is now in effect. R. G. Ivey, vice-president of the company, recently appeared before the Provincial Cabinet to present the claim of his company. Adam Back and City Solicitor Meredith appeared before the Cabinet on behalf of the city.

More One-Man Cars in Use in New Jersey.—As a measure of economy the Public Service Railway, Newark, N. J., is extending the use of its one-man cars. In the Central division of the system one-man cars have been placed in operation on the Middlesex and South Amboy lines. Other lines which tried out the one-man type of cars recently were the West Hoboken line operating in Hoboken and West Hoboken; Pavonia line, in Jersey City, and the Clifton line, in Newark. The Bergen line in Newark has been using the one-man cars for several months.

Personal Items

G. E. Departments Combine

Publication and Advertising Departments to Merge on Dec. 1 with M. P. Rice as Manager

The publication and advertising departments of the General Electric Company will be combined on Dec. 1, with Martin P. Rice, as manager of the publicity department, in charge.

Frank H. Gale, advertising manager, will on Dec. 1 become assistant to D. R. Bullen and manager of conventions and exhibits. Mr. Bullen was recently appointed assistant vice-president, and Mr. Gale will do important association work.

C. H. Lang, who has been assistant to Mr. Rice as manager of the publication department, will continue as assistant manager of the newly created publicity department, and T. J. McManis, who has been manager of the department of publicity for the Edison Lamp Works of the General Electric Company at Harrison, N. J., will also become an assistant manager of the new department.

In addition to the above announcement made by President Gerard Swope, an advertising council has been created, with the following members and with Director B. G. Tremaine, Vice-presidents J. R. Lovejoy, George F. Morrison and F. S. Terry and A. D. Page as ex officio members of this council: Chairman of the council, J. G. Barry; manager of publicity department, M. P. Rice; assistant manager of the publicity department, T. J. McManis; P. B. Zimmerman, George C. Osborne, L. P. Sawyer and G. P. Baldwin; advertising counsel, Bruce Barton, and secretary of the council, C. H. Lang.

Mr. Rice, the new publicity manager, has been in the employ of the General Electric Company for twenty-eight years. He was graduated from the University of Pennsylvania in the class of 1893 with the degree of bachelor of science, and then took a post-graduate course, receiving the degree of mechanical engineer.

Mr. Rice entered the service of the General Electric Company in 1895 in the drafting room. After nine months he was transferred to the engineering department, and when the X-ray was discovered was assigned to that new work. The publication bureau was organized in December, 1897, and he was made manager, a position he has since held. In this position he had supervision of all company printing, photographs, technical data and all general publicity for the company. In June, 1903, he established the *General Electric Review*.

In February, 1921, when the General Electric Company became interested in radio broadcasting, Mr. Rice was made director of radio broadcasting and in

this position outlines the company's policy in this new field. He readily recognized that broadcasting should be more than a mere entertainment to be successful and that its programs should be educational and helpful to the public in the distribution of interesting news events of the day. The company is now building a second large radio station at Oakland, Cal., and has definitely announced plans for a third station to be built at Denver, Col., both of which will come under Mr. Rice's supervision.

Mr. Gale has been in charge of the space advertising of the company for the last seventeen years. As a member of the staff of Dana R. Bullen, assistant vice-president, he will assist Mr. Bullen in the manifold activities of his

M. P. Rice

new work, and in particular will have charge of conventions and exhibits. He will have the title of manager of conventions and exhibits, and his field will be one with which his work has made him very familiar.

Mr. Gale entered the service of the Thomson-Houston Electric Company at Lynn, Mass., in 1890 as a draftsman. Later he served in the catalog department. With the formation of the General Electric Company in 1892, into which the Thomson-Houston Company was merged, his work took him to Schenectady, to the Schuyler plant at Middletown, Conn., to the Edison Lamp Works at Harrison, N. J., and to the Brush Works at Cleveland, Ohio, where he was also associated with the Short Electric Railway and the Sperry Electric Railway.

He returned to Schenectady in the spring of 1895, and in 1899 was transferred to the commercial department. In 1901 he had charge of the company's interests at the Pan-American Exposition at Buffalo, and since then has had supervision of such work at all exhibits and conventions, notably at the St. Louis and San Francisco world's fairs. He was awarded a gold medal at

the San Francisco Exposition for the excellence of the design of the company's exhibit. Following the St. Louis Exposition he was placed in charge of the company's advertising in periodicals and later given the title of advertising manager.

A. V. Kipp, traffic manager of the Salt Lake & Utah Railroad, has been appointed assistant general freight agent of the Oregon Short Line. Mr. Kipp has been traffic manager of the Salt Lake & Utah Railroad since March 1, 1921. For six months prior he served as general freight and passenger agent for the road. He has been constantly connected with railroads of the West since he entered the service of the Union Pacific at Omaha in 1902 as telegraph operator. He consecutively became chief operator at the Omaha office, traffic agent for shipments in Wyoming, traveling freight agent with headquarters in Denver and contracting freight agent for Denver. During the war he had charge of the traffic department of the United States food administration for Colorado. Mr. Kipp's successor as traffic manager has not yet been named.

Don. C. Farra, for twelve years connected with the freight department of the Boston & Maine Railroad, has been appointed freight agent of the Springfield Terminal Railway Corporation, Springfield, Vt., owing to heavy freight movements over the Springfield-Charlestown, N. H., electric line.

Edward M. Raver has been appointed claim agent of the Chicago and West Towns Railway at Oak Park, Ill. For the past seven years he has served as supervisor of claims for the northern district of California, with the Union Automobile Insurance Company at San Francisco. He has been connected with the Fort Wayne & Northern Indiana Traction Company and as superintendent of transportation with the Michigan United Railways at Jackson and Battle Creek. For three years beginning in 1913 he was superintendent of transportation and claim agent with the Lincoln Traction Company of Lincoln, Neb.

Obituary

Edwin W. Olds, once prominent in the electric railway field, died recently in Long Beach, Cal., at the age of seventy-six. Early in 1911 Mr. Olds resigned as superintendent of rolling stock of the Milwaukee Electric Railway & Light Company and with that resignation severed his connection with the electric railway industry. He entered the service of the Milwaukee company in 1896. He was one of the organizers of the American Electric Railway Engineering Association and had always been prominent in the councils of that body. He served as president of the association in 1903-04.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions

for Discussion of Manufacturing and Sales Matters

Fewer Electric Railway Repair Shops Employ More Men

The reduction in the number of electric railway car repair shops in the United States is an outstanding feature of a report recently published by the Department of Commerce. Whereas there were in 1919 some 624 such repair shops, there were only 560 two years later. In spite of the reduction in the number of shops, however, the number of workmen employed increased from 33,120 to 35,638. Their wages increased from about \$39,000,000 in 1919 to more than \$47,000,000 in 1921. The number of salaried employees, as shown in the table below, increased more than did the number of wage earners. In 1921 such employees numbered 2,359, as compared with only 1,847 in 1919.

This report shows also the distribution of the shops by states. Pennsylvania leads in the number of electric railway car repair shops with 70, Ohio is second with 65 and New York is third with 45. Illinois, with 42, is not far behind. In number of employees, however, New York is first with 5,799,

Pennsylvania is second with 4,458 and Illinois third with 4,021. Ohio, which ranks second in number of establishments, ranks below California in number of employees. Wages have followed the same general trend as the number of employees, although Illinois, with fewer employees than Pennsylvania, nevertheless pays a considerably larger sum in wages.

American Couplers Going Abroad

During recent months the Ohio Brass Company has received a number of orders for Tomlinson standard automatic couplers for use in foreign countries. Cia. Metropolitan Alfonso XIII, Madrid, Spain (the subway of Madrid), has purchased eighty-four coupler equipments. Companies in Australia have purchased coupler equipments for 150 cars. Both of these orders call for couplers comprising automatic electrical coupling as well. The railway in Haarlem, Holland, recently bought couplers for seventy-five cars, and 200 coupler equipments were ordered from Rio de Janeiro. Japanese companies have ordered 120 couplers.

Brill Buys Service Motors

The J. G. Brill Company, Philadelphia, has purchased the railroad motor coach division of the Service Motors, Inc., Wabash, Ind., with exclusive rights for the production and sale of the type of gasoline driven rail cars heretofore known as the Service Model 55 railroad motor coach. While the Brill Company has heretofore furnished only the bodies for these cars, it will now furnish the complete unit without change in design. With its extensive facilities the company will be better able to meet the increased demand for this type of equipment. In the future this type car will be known as the Brill Model 55 gasoline car.

Cars of this type have been operated for more than 1,500,000 miles in the United States. Twelve similar cars are now being built for the Australian Government Railroad. They are about 44 ft. long and weigh in the neighborhood of 28,000 lb. The renewal part business for the cars now in service and the guarantees given by Service Motors, Inc., have been taken over by Brill.

The purchase gives the Brill Company a complete line of automotive cars for steam railroads ranging from the thirty-passenger, six-wheel type to the Model 55 with a maximum capacity of fifty-five passengers. This part of the business is handled by the automotive car division, with C. O. Guernsey, designer of the Model 55 and formerly vice-president of Service Motors, as chief engineer. C. J. McPherson, A. H. Hudson and A. F. McCormick, all formerly of Service Motors, have joined the Brill organization to assist in this work.

Dayton Air Brush Company to Be Sold

The assets of the Dayton Air Brush Company will be offered for sale at the Montgomery County Court House, Montgomery County, Ohio, on Nov. 24. They will be sold at such prices as may be approved by the court. The assets consist of patents, good will, accounts receivable, and a small amount of equipment and parts. The order for the sale was given by Judge Robert C. Patterson of the Common Pleas Court of Montgomery County, Ohio.

Metal, Coal and Material Prices

Metal—New York	Nov. 13, 1923
Copper, electrolytic, cents per lb.	13.375
Copper wire base, cents per lb.	16.00
Lead, cents per lb.	6.875
Zinc, cents per lb.	6.425
Tin, Straits, cents per lb.	44.50

Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	\$4.30
Somerset mine run, Boston, net tons	2.375
Pittsburgh mine run, Pittsburgh, net tons	1.925
Franklin, Ill., screenings, Chicago, net tons	1.45
Central, Ill., screenings, Chicago, net tons	1.05
Kansas screenings, Kansas City, net tons	2.25

Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	\$6.50
Weatherproof wire base, N. Y., cents per lb.	16.50
Cement, Chicago, net prices, without bags	2.50
Linseed oil (5-bbl. lots), N. Y., per gal.	0.93
White lead, in oil (100-lb. keg), N. Y., cents per lb., carload lots	11.25
Turpentine, (bbl. lots), N. Y., per gal.	0.97

Directors Declare Dividend

The board of directors of the Pressed Steel Car Company, Pittsburgh, met on Nov. 8 and declared the regular dividend of \$1.75 per share on the preferred capital stock and a dividend of \$1 per share on the common capital stock. No announcement was made, however, concerning the volume of business done nor the earnings. It is expected that this information will be contained, however, in the annual report which will be issued about the end of February, 1924.

Rolling Stock

The Illinois Traction, Inc., is preparing to purchase seventeen new, one-man, light-weight, double-truck interurban safety cars for its Ottawa division, which was formerly known as the Chicago, Ottawa & Peoria Railway.

Houston Electric Company will, if it follows the recommendation of John A. Beeler to the city, purchase fifteen new one-man cars at a cost of \$180,000.

Department of Street Railways, Detroit, Mich., has been authorized by the City Council to purchase fifty new double-truck Peter Witt type cars and one three-car train. The three-car train will be used for experimental purposes to determine its practicability on lines such as that on Woodward Avenue. A train of the kind proposed would be 122 ft. long and would require a motorman and three conductors to operate. The equipment would cost \$29,230 and the cars making up the train would have a seating capacity of 134 passengers. Delivery on the three-car train is expected about Jan. 1 and on the first of the Peter Witt cars about Feb. 1. The sale of fourteen of the city's one-man cars has been authorized by the Council. These cars will be replaced by larger ones.

Cleveland Southwestern & Columbus Railway, Cleveland, Ohio, has purchased twelve new interurban cars to be built by the Cincinnati Car Company.

New Orleans Public Service, Inc., has purchased twelve new double-truck cars of the Perley A. Thomas Car Company, High Point, N. C.

Toronto Transportation Commission is planning either to purchase seventy new cars or rebuild a number of its old cars.

Havana Central Railroad, Havana, Cuba, has placed an order with the Wasson Car Company for six new cars.

Track and Line

Community Traction Company, Toledo, Ohio, will double track Sylvania Avenue from Martha Avenue to Jackman Road with extension of service on Tremainsville Road on the tracks of the Toledo & Western line. Extension will be made at a cost of \$100,000. Double tracking in Sylvania Avenue is part of a pro-

gram to repave and widen the thoroughfare.

New Orleans, La.—Two franchises affecting the reorganization and rerouting of the New Orleans Public Service, Inc., on the lines laid down in the Beeler report have been offered the Commission Council by Commissioner Paul H. Maloney of the Department of Public Utilities. One, covering the Elysian Fields Avenue franchise, provides, as a compromise to the Beeler suggestion, that the New Orleans Public Service, Inc., shall construct a single-track line on the upper side of Elysian Fields Avenue from North Claiborne Avenue to Hope Street, with a shuttle service from North Claiborne Avenue. The other franchise provides for the extension of the Broadway lines with double-track service from South Claiborne Avenue to Broad Place; thence on Broad Place to Almonaster Street, where it will resolve into a single-track line, continuing out Almonaster Street through such streets as residents in that section of the city, who are opposed to the Beeler recommendations, have approved.

Grand River Valley Railway, Grand Junction, Col., will be extended $3\frac{1}{4}$ miles into the High Line district, one of the best farm land sections of the state, at an estimated cost of \$65,000. The work will be started at once.

Citizens Traction Company, Oil City, Pa., is planning to lay a single track at the end of the double track on Main Street at Relief Street to the shops and offices of the National Transit Pump & Machine Company. This will provide service for the men employed in the Third Ward shops as soon after the closing of the suspension bridge as possible. Permission will have to be obtained from a number of sources, such as the city and the Erie Railroad.

Power Houses, Shops and Buildings

Wisconsin Public Service Corporation, Green Bay, Wis., completed work in replacing its 25-cycle generators at its High Falls hydro-electric plant with new 60-cycle generators. This is in line with its policy to change all plant equipment to 60-cycle generators and also to change all motors and meters on lines using current to 60 cycles, thus eliminating the need of frequency changers.

Paducah Electric Company, Paducah, Ky., is constructing a new power station which represents an investment of \$370,000. It is expected that the new unit will be in operation early in 1924. The structure when complete will house a new 2,500-kw. turbine and boiler equipment of the most modern type. The unit is being erected adjacent to the old power plant and in time the two will be linked together. The combined generating capacity will be 6,000 kw.

Trade Notes

Transit Equipment Company, New York, N. Y., is establishing a new method to bring the bus to the electric railways by taking the latter's obsolete material in part payment for any buses they purchase.

Standard Underground Cable Company, Pittsburgh, Pa., announces the following changes in its Perth Amboy, N. J., organization: H. W. Fisher has been advanced in title to technical director of electrical engineering, while continuing also as manager of the lead cable and rubber departments. R. W. Atkinson has been appointed chief electrical engineer. G. J. Shurts has been made production manager of the lead cable department.

New Advertising Literature

Beckwith-Chandler Company, Newark, N. J., paint and varnish manufacturer, has ready for distribution a comprehensive sample booklet of its line of motor coach colors. This pamphlet will be of particular interest to companies operating and maintaining motor buses.

Reliance Electric & Engineering Company, Cleveland, has issued a thirty-two page booklet on electric motors. It describes how electric motors are to be chosen and used. It also gives methods of installing motors, rules for determining the size of motors required for different applications and an analysis of some troubles which may be encountered. Copies of the booklet will be sent to interested persons without charge.

Edison Lamp Works, Harrison, N. J., has issued a thirty-two-page pamphlet entitled "Lighting for Traffic Control." The booklet contains illustrations of many types of traffic signals and how they are operated.

Miller Trolley Shoe Company, Boston, has issued a new circular entitled "About Wire Wear." It features and describes tests of trolley wire wear over a period of six years on the Portland-Lewiston Interurban Railway division of the Androscoggin Electric Company. This road has been using Miller trolley shoes exclusively for many years, and the pamphlet gives interesting statistics of micrometer measurements made by the railway company's engineers on its trolley lines.

American Manganese Steel Company, Chicago Heights, Ill., has issued a six-page pamphlet, accompanied by illustrations, entitled "A Better Manganese Crossing."

Elliott Service Company, New York, N. Y., through its public safety division, has issued a pamphlet called "Reaching the Public with the Safety Idea." The pamphlet states that accidents can be prevented and it attempts to give the solution of the problem.

Electric Railway Journal

Consolidation of Street Railway Journal and Electric Railway Review

Published by McGraw-Hill Company, Inc.

HENRY W. BLAKE and HARRY L. BROWN, *Editors*

Chamber of Commerce Committees Make Constructive Reports

IT IS gratifying that a strong indorsement of the principle of co-ordination of service between bus and trolley is given in the report just issued by the special committee of the United States Chamber of Commerce appointed to study this question. Although representatives of the motor transport interests made up a considerable proportion of the committee, the report declares that the bus and the electric railway cannot permanently exist in a community and pay their way in competition with each other. It also says that there should be in each community a single reliable transportation agency, rather than individual transportation units, and that the electric railway is the best medium for the mass transportation of passengers and should be the foundation of the suggested co-ordinated transit system.

Nor is there any doubt as to where the committee stands in regard to regulation. Briefly, the committee says that any one engaged in the business of common carrier by motor vehicle should be subject to regulation as to its rates and service, just as any other common carrier. Regulation by state bodies having jurisdiction over intrastate traffic has been generally accepted in this country and should be applied to motor vehicle common carriers as well as to other public utilities. If a certificate of public convenience and necessity is granted to the operator of a motor vehicle, he should be compelled to furnish ample evidence of financial responsibility, or else carry insurance adequate to cover all injury to persons or damage to property resulting from negligent operation.

Of course, the need of any public carrier to assume full responsibility for damage caused by his negligence is not a new idea. The business of public carrier is one of the oldest in the world and reliability and responsibility are at the basis of the duties which the experience of centuries has shown should be placed on persons so engaged. Our present regulatory laws simply elaborate these rules to adapt them to modern conditions, particularly the replacement to a great extent of the individual carriers of the earlier days by large transportation systems. Primarily the purpose of all these laws is to protect the public by securing (1) regular and adequate service, (2) reasonable rates, and (3) responsibility of the carrier for damages which he may cause during transportation. There can be no permanent gain to any community which ignores these fundamental principles. jitney service failed in respect to them, particularly regularity of service and responsibility, and this automatically keeps jitneys out of the class of legitimate common carriers.

The committee on taxation of motor transportation agencies of the national chamber, on which motor transport interests were also largely represented, has made

an equally valuable report. It points out that present electric railway taxes are unsystematic, to say the least, yet amount, with imposts, to nearly \$100,000,000 a year, while the maintenance of track amounts annually to even more than this sum. The committee comes out strongly for a tax based on both gross and net returns, rather than an ad valorem tax, for greater tax simplification and for placing the entire expense of maintaining improved highways upon the users of those highways. This latter recommendation should tend to make each form of transportation bear its fair share of the public expenditure, while the whole program of this committee if carried out should help to place the transportation agencies of this country on a logical basis and enable them to stabilize their financial status and to be of even greater help to the nation.

Proper Basis for Valuation Is of Vital Importance

VALUATION of electric railway properties continues to be a major topic for discussion. This is evidenced by the recent report of the committee on valuation of the American Electric Railway Association, printed in full in the issue of this paper for Nov. 3, and by the discussion by L. R. Nash which appears in this issue.

There have been so many differing views on the subject that the committee had much work to do to bring together the opinions and decisions rendered on the subject by the various regulatory bodies. Out of twenty-six commissions replying to a questionnaire sent out by the committee, fourteen, or more than half, belong to the class that refuses to recognize either original cost or reproduction cost of the present date as controlling, and have no definite method of relative weighting for these two evidences of value. Four others consider reproduction cost in varying degree. These eighteen, or 69 per cent of those replying, give some weight to reproduction cost, but it is difficult to determine just how far they consider it. The remaining eight commissions either ignore reproduction cost entirely or have some special theories of their own.

In view of the various decisions of the Supreme Court of the United States it is rather surprising that reproduction cost should figure so little in the decisions of the commissions. The only apparent reason why they should take this stand is that the Supreme Court itself has never made definite the weight that should be given to reproduction cost, merely stating that it must be considered. The railway valuation committee finds that the commissions in the largest group mentioned state that they consider all evidences of value which are presented and all other matters or circumstances which they feel have a bearing on the case, and

then announce what they believe to be the fair value under all of the circumstances. This is subject to such a broad interpretation that it may mean much or little, though shrouding the method in mystery often leaves an opening for the feeling that politics should have been included in the list of elements considered in the final determination.

The decisions of the courts, both state and federal, show less variation, according to the committee. These have held quite generally that the basis of rate making is the present value of the property, and that the present value is not necessarily either "prudent investment," "original cost" or reproduction cost at abnormal prices. Of course this again is disappointingly indefinite, for it states what present value is not, but fails to show what it is.

Comparison of investment value and reproduction cost is brought out in a definite way in Mr. Nash's discussion. Taking a hypothetical case, he shows how the investment value may be greater or less than the cost to reproduce at prices current. Where prices are rising, the cost of reproduction is the higher; but where prices rise and then fall as they have done during and since the war, and continue to fall as he states they are likely to do in the future, the actual investment soon becomes greater than the cost to reproduce. Thus there is a real danger to the utility in attempting to secure valuation on the basis alone of cost of reproduction at current prices, in that if it were followed to its logical conclusion during an era of falling prices the rate base allowed would not be sufficient to support the securities issued.

This shows rather clearly the weakness of the position taken by former valuation committees in declaring for reproduction cost at current prices, and this, undepreciated. The 1923 committee's report is more practical, and it is believed that the position it recommends would put a company in a better light before a regulatory body. Its work is a contribution in the direction of clarification and stabilization of valuation procedure. This is exceedingly important, since higher interest rates are demanded and capital is harder to secure in proportion to the doubt that exists as to the outcome of the question of the rate base on which the utility is entitled to earn.

Secretary Mellon's Recommendations and Railway Taxation in General

WITH the opening of Congress now only a few days off, special interest attaches to the marked indorsement which Secretary Mellon's tax reduction recommendations are receiving from business interests generally. These reductions are possible, of course, only if the incoming Congress does not pass a soldier's bonus or other bill which would add seriously to the outgo of the treasury. Hence a tax reduction act at this coming session is by no means sure. Nevertheless, as the Secretary's outline will probably form the basis for any tax reduction bill introduced by the majority party, its effect on electric railway companies may be considered.

As the Secretary's recommendations contain no suggestion of a reduction in the present corporation tax of 12½ per cent on net income, the effect on railways will come primarily from the larger market which they, like other corporations, will have for their securities, due to the reduction of surtaxes. This was one of the pur-

poses of the recommendations—the hope that some of the capital now going into tax exempt securities because of the high surtaxes would return to the field of productive business. Tables accompanying Mr. Mellon's letter to the House ways and means committee show in a striking way the virtual disappearance from the tax rolls of persons with large incomes. In the \$300,000 a year class, the reduction was from 1,296 in 1916 to 246 in 1921. Under the present surtax rates taxpayers with this income practically cannot afford to invest in securities other than those which are tax exempt.

Just how far the Secretary intended his incidental suggestion about abolishing for the purpose of the income tax capital losses and capital gains is hard to say. If these were given up, it is probable that investors would seek bonds carrying a low interest rate but sold at a large discount. Thus they would have to account only for the return received as interest. Even under the present law this is rather a profitable plan for the bond buyer, because it postpones till a later year, when the income tax rate will probably be lower, the portion of the return represented by the discount at which the bond was purchased; or he can group his capital gains in one year so as to take advantage of the 12½ per cent provision.

It is to be hoped that the discussion on taxation which is bound to take place in Congress this coming session will stimulate a study of the same subject in state capitols and by municipal governments. According to figures recently issued by the National Industrial Conference Board, while federal expenditures decreased from \$6,112,243,000 in 1920 to \$4,849,708,000 in 1921, expenditures of state and local governments increased during the same years from \$3,808,523,000 to \$4,523,887,000. The opportunity to sell bonds at low rates of interest has been a contributing reason for the plethora of expenditure in which local governments have lately indulged. Here is where a conference on taxation, if undertaken by a national body of influence, like the United States Chamber of Commerce, would help. Senator McCormick of Illinois recently made the suggestion that President Coolidge call a national conference of state and local taxing authorities to consider checking the steady increase of tax burdens.

From any reform which would put on a more scientific basis our present tax laws, the electric railway industry would be almost certain to receive benefit. This is shown by the situation in New York State. Here in 1922 a committee, of which Senator Davenport was chairman, canvassed the whole tax situation, and found that the taxes of the electric railway companies in New York were proportionately to both their gross and net incomes far greater than those of any other class of utility, and still greater on net than general business corporations, the net of these corporations being the only figures available as these are the ones on which their state tax is based. The figures from New York State are probably not greatly different from those which would be found in other states. While no general relief has come as yet in New York as the result of this committee's work, it is likely that when readjustment does come something will be done in removing the obvious inequality of tax assessment from which the railways are suffering. Similarly, studies in other states would pave the way for a fairer taxing of the electric railways.

Keeping Cars on Time

The Duties of Supervisors and the Importance of Adherence to Time-Tables
Discussed by J. R. Ong in His Los Angeles Report—Other
Suggestions for Improvement of Service

AN ACCOUNT of the traffic situation in Los Angeles, based on a report recently made to the management of the Los Angeles Railway Corporation by Joe R. Ong of Piqua, Ohio, was published in the issue of this paper for Nov. 3. That article also gave a number of ways by which, through the co-operation of the city, the situation could be helped. Mr. Ong's report included also observations as to electric railway operation in Los Angeles, with a discussion of supervisors and time-tables. An abstract follows of those observations of most general interest, with some additional information on the form of supervisor's book mentioned.

Adequate supervision is an essential feature of satisfactory service. Supervisors are the company's official representatives in directing the operation of cars on the streets. They should be able to grasp a situation and act quickly, at the same time displaying good judgment in their decisions.

Quite naturally, supervisors are recruited from the list of motormen and conductors because such a background of experience is necessary. In order that a supervisor's position may appeal to the trainmen best suited for it, it should be attractive not only because of its increased responsibility and authority, but also because of its financial advancement. In Los Angeles supervisors' salaries should be materially increased above the present scale so that it will be possible to attract the best men in the train service. The hours should be arranged to alternate the day and night work for all supervisors, the changes being made at intervals of two weeks or four weeks, because straight night work as a supervisor for several years makes little appeal to a platform man holding a good day run.

DUTIES OF SUPERVISORS

A supervisor's chief duties are to keep cars on time under normal conditions of operation and to see that patrons of the line get the best possible service under any unusual conditions that may arise. Normally, therefore, the supervisor should be watching his cars and checking their actual time against their scheduled time and ascertaining the cause for any deviations. Chronic cases of irregular operation should be checked in particular and fully reported so that appropriate measures for correction may be taken.

Obviously a supervisor cannot check his cars from memory unless he has very few cars on a regular but infrequent headway. It, therefore, has been the practice to supply the supervisors with schedule data showing the time cars are due to leave the terminals, arranged in the order in which they are due to leave. Many supervisors carried only the terminal times in their books and had no time shown at the point where they were stationed for a period of several hours daily. The result was that an individual mental calculation of time had to be made in order to check each inbound

car by adding to the terminal time the running time to the point of observation, and to ascertain if that total corresponded to the observed time.

Upon Mr. Ong's recommendation there was adopted an improved type of supervisor's book which greatly facilitates his work. Time by half-minute intervals is printed in a column in the center of the page. The left half of the page is used for inbound cars and the right half of the page is used for outbound cars, one column being reserved for each route passing the checking point for which the book is made up.

The new book is made up to show the time that each car on the schedule is due to pass the supervisor's

Page from Supervisor's Time-Point Book, as Used in Los Angeles

station by having its train number in the proper route column on the proper horizontal time line. This enables the supervisor to tell quickly whether the car is on time, late or ahead of time. The clearly detailed yet compact arrangement of the schedule data enables him to tell quickly the relative position of the cars from different routes on common track, and if at a junction he can readily direct which car should have the preference when two arrive at the same time.

A part of a page of this book is reproduced. The letters J, H, R and S indicate routes. J and S are split lines, i.e., the cars run to two terminals. The large figures show train numbers. The small figures show minutes layover at the next terminal.

The figures are inserted in this book before the supervisor goes out on the street and he makes no notes in the book on the street. It is his reference book on schedules in concise form so that he can quickly determine when the cars should pass him.

All figures in the book except the headings are put in with pencil so that in the event of a schedule change on one line the train numbers on the old schedule are erased and the new train numbers put in without the necessity of making a whole new book. The supervisor may indicate by key letters or characters the destination of cars on split lines or cars scheduled to short terminals, and other information such as night cars which he may

desire to watch with particular care after the headways begin to spread.

To protect the book from the weather, sheets of transparent celluloid may be cut to page size and held on by rubber bands. For very wet weather a celluloid case large enough to take the book when open may be used.

Such a case is very similar to the identification card case one carries in the pocket except for size, closed on three sides and open at the bottom.

As explained, the book shows by a small number the layover at the next terminal for each train, so that the supervisor has right before him the number of minutes

The Upper Table is a Reproduction of Part of a Schedule Sheet, with Run Guide and Working Times for Crews. The Lower Table Shows in Type the Running Time Between Time Points in the Schedule Sheet Reproduced Above

leeway he has on the outbound car before it will be necessary to consider turning it short of destination. For example, if an outbound car has seven and one-half minutes layover and passes the supervisor six minutes late it should leave the terminal on time. If the car was twenty minutes late outbound with only seven and one-half minutes layover it lacked twelve and one-half minutes of having time to make the terminal to leave on time. The supervisor then may put this car on time by turning it back at a crossover from which the running time to the terminal and return is not less than twelve and one-half or thirteen minutes.

The advisability of turning cars short of scheduled destination is a matter that must be considered in the light of circumstances and conditions at the time. It would depend upon how many passengers the car had on board, upon whether the prevailing direction of travel was outbound or inbound, upon whether other cars were immediately ahead of or behind the car to be turned short, and perhaps on some other conditions.

The elimination of, or a reduction in the number of, turnbacks may be a general indication of improved operating conditions, but the fact must not be overlooked that there are times and conditions when the service would be benefited if there were more turnbacks. There are usually more people desiring transportation at other points along the line than at the terminals and they are to be considered. Day cars which are late in the morning rush and night cars which are late in the afternoon rush often can be advantageously put on time by turnbacks, and the service to the terminal supplied by a tripper which is due to pull in.

STREET SUPERVISION EIGHTEEN HOURS A DAY

On a system the size of the Los Angeles Railway there should be direct supervision on the street for approximately eighteen hours per day, according to the following plan. Supervisors should be located at strategic points for control of the various lines. On through routes there should be a supervisor located on each half of a line at a point beyond the congested area, each supervisor looking after one or more lines passing his station.

One supervisor should be held primarily responsible for each line to avoid confusion over orders, but the supervisor stationed on the other half of the line should assist in carrying out the plan of control determined upon by the supervisor in charge. In fact, each supervisor should have in his book the times of cars on all lines past his station—not that he will have to work all of them but that he should be in a position to step in and take action in an emergency.

It is not contemplated that a point supervisor can never be taken off the point. He should leave his station to go to an accident, derailment or blockade if he can do more good there, but except in emergencies he should stay at his point, which, if properly selected, is the strategic point for the control of the lines under his direction.

The objection is sometimes raised to point supervision on the ground that the crews always know where the supervisors are located and may be leaving terminals late, running by passengers or running ahead of time because they think it will not be discovered. If the point supervisors are giving careful attention to the cars passing their stations they will usually be able to

detect any serious irregularities. A limited number of traveling supervisors should be assigned to travel on several lines to correct such matters as mentioned in this paragraph and to follow up cases of recurring irregular operation reported by the point supervisor.

On many street railways the division superintendents have the responsibility for the operation of cars on the street, but on the Los Angeles Railway this function is delegated to "district chiefs" under the director of traffic. The district chiefs should be assigned to a certain territory and have general direction of all lines and all supervisors within that territory. Territorial division for the district chiefs is to be preferred over a group of through lines, because it enables them to cover the lines with less lost motion or duplication of supervision on trunk lines. It gives a better distribution of their services.

PREPARATION OF SCHEDULES

In the preparation of schedules Mr. Ong's recommendations for using traffic graphs have been adopted and are now in effect. Twenty-minute charts (similar to that shown below) for several different days are taken and analyzed, with one day compared with another and corrected for distortions. A representative one is then selected. From it the headways are determined based

Schedules Are Drafted After Studies of Charts Like This

on the number of passengers carried. For example, the chart published shows approximately 250 passengers as the average sustained maximum per twenty-minute period during the middle of the day in the controlling direction of travel, which is inbound. If it is desired to schedule service on the basis of fifty passengers per car, then five cars will be required in each twenty-minute period, resulting in a four-minute headway. It may be noted that after 11:40 a.m. the inbound travel falls off so that a four-minute headway throughout the middle of the day would show an average of less than fifty passengers per car.

In a similar manner the headways required for other periods are calculated except that in the rush hours the average number of passengers per car must be increased to perhaps eighty or eighty-eight. To carry 1,300 passengers per 20-minute period on the basis of eighty per car would require a one and one-quarter-minute headway. And in this manner the required headways past the point of maximum load are selected. In translating the twenty-minute chart into headways a convenient table

has been devised which shows the passenger carrying capacity on different headways at different densities of loading per car.

In addition to the traffic charts from which the headways are determined, the schedule maker must also have riding checks to show the time required between time points all along the line at the different periods of the day. Preferably he should make several trips himself over the line to refresh his knowledge of conditions.

Where all cars do not go through to the end of the line, short line cars should follow longer headways than through cars in order to balance the loads on the long and short line cars. Thus, an average main-line headway of five minutes might be split as a six-minute interval before the short-line car and a four-minute interval before the long-line car, or the differential cut to one minute by using five and one-half and four and one-half-minute spacing.

A change has been made in the form of the schedule and crew assignment sheets. Formerly the schedule sheet showed the leaving times of each train number from one terminal on the left half of the sheet and from the other terminal on the right half of the sheet, all on one horizontal line. To follow a train number through its operation from the time it left the carhouse until it pulled into the carhouse it was necessary to look back and forth from one side of the sheet to the other. This schedule sheet was never posted for the trainmen but was used for office reference. Copies were secured by the ditto-graph.

For the trainmen's use there was a large sheet that showed the day's work for a crew arranged in a horizontal section of the sheet, giving the various times at which they were due to leave the terminals and the times when reliefs were made. On this sheet the various pieces of work by each crew were grouped together, but in order to follow one car or train on its schedule throughout the day it was necessary to look all over the sheet for the particular train number. For the division clerks, the timekeepers and the auditor's office a condensed work run sheet was supplied showing "time on" and "time off" for each piece of work for each crew and the total time of the run. Thus, on the old plan, the information was grouped three ways on three forms.

NEW SCHEDULE REPLACES THREE SHEETS

On the new form of sheet (see page 888) the information that was formerly in three places has been combined on one form and additional information shown. The run guide as arranged in the form previously sent to the timekeeper is retained in the new schedule sheet. The times that cars are due to leave terminals and one intermediate point on each half trip are shown in the body of the schedule. The intermediate time shown is usually for the time point just at the edge of the congested area inbound.

The details of runs are read horizontally, and each section of the details of runs represents the movements of an individual car or train during the day. The movements of each individual crew are indicated by run numbers written in bold figures, so that the various pieces of work of each individual crew may readily be picked from the schedule. By using this method, the schedule permits one to follow all movements of cars as well as crews, a feature which is not easily possible when each horizontal section of the details of runs refers

to the day's movements of an individual crew rather than of an individual car.

The new schedule sheets are prepared on the typewriter and are arranged for blueprinting so that as many copies as desired may be had at any time. All working copies should be blueprints. The master copy should be kept corrected to date so that any copies taken at any time may be correct. An office copy, a carbon copy of the original, should be kept to show the successive changes and alterations without obliterating the original figures, so that ready reference may be had at any time to the exact times on the schedule on any particular date.

WORK ASSIGNMENTS FOR TRAINMEN

It is also a part of the work of the schedule department to make up the work runs for motormen and conductors after the schedules have been prepared. Inasmuch as schedules are based on the demands of traffic they should be laid out to meet that demand as nearly as is reasonably possible and not with the idea of providing work runs for any individual trainman or group of trainmen. Conditions controlling the number of cars operated are something which the company cannot change and therefore it is not to be expected that work runs for the motormen and conductors can be laid out exactly the same from one schedule to another. The cars cannot leave and return to the carhouse at the same times on all schedules.

Those not familiar with the street railway business sometimes find it difficult to understand why the working conditions for motormen and conductors cannot be made the same as working conditions for employees in other lines of business. For example, the question is raised why is it necessary for street railway men to have such a long spread of time in which to complete a day's work. It might help some in the understanding of this question if reference were made to the lower chart on page 772 of the Nov. 3 issue showing the cars scheduled for operation on April 2, 1923, by one-hour periods throughout the day. Cars must be on the street in time to take other employees to their places of business in the morning, and cars must be on the street to take other employees home and return to the carhouses in the evening, so that street car men are required to extend their day's labor over a long period of time.

Many references have been made to the morning and afternoon rush periods when great masses of people demand transportation within limited periods of time. This uneven demand for service is one of the fundamental characteristics of the business which every street railway would gladly change if it could, because it affects not only the working conditions for the trainmen, but also involves a heavy expense on the part of the company for cars, carhouses, power, substations and equipment in use for only a limited period.

One of the fundamental difficulties in connection with the operation of cars on the Los Angeles Railway was that too many of the cars were operated as trippers by extra crews and not enough of the cars were made a part of regular runs. This means an unusually large extra list and it means that men have to "fight the extra board" for perhaps several years. This is not a satisfactory condition of affairs and could be improved by allowing a slightly greater spread in the runs so that the day crews coming out of the carhouse not too early in the morning could be used again in the afternoon rush.

It is apparent from the chart on page 772 of the Nov. 3 issue that a great many crews must be used both morning and afternoon if the total number of cars operated are to be handled efficiently. The spread in the runs on the lines of the Los Angeles Railway is not excessive and in fact is much lower than the spread in runs on most other large city properties. It is considered a distinct detriment to the service, without being an advantage to any particular number of men, to maintain the old system of making up runs. It was recommended that more of the trippers be worked into parts of regular runs and that the allowable spread in the time to complete the day's work be sufficiently extended to permit this.

OTHER SERVICE IMPROVEMENTS

A number of other service improvements were also introduced as a result of the survey. Thus, the layover time was reduced by introducing more time points, particularly during the outbound trip and by an adjustment of running time to meet the varying conditions of operation. This kept some motormen from speeding and resulted in better spacing of cars along the line and less bunching of cars at the terminals. Further reduction in layover time is expected to follow the adoption of a further differential in running times. It had been the practice for some time on the Los Angeles Railway lines to have only two running times, i.e., "short" time and "long" time. Short time was from 6:15 p.m. to 7 a.m. and long time from 7 a.m. to 6:15 p.m. It will be noted that the new schedule on page 888 calls for several running time changes in twenty-four hours.

Larger train number plates were put on so that the supervisor could distinguish train numbers more quickly and easily. Formerly the train number was on a 2½-in. disk and was carried inside the window on the front end of the car only. The new train number plates are of sheet metal 5½ in. x 6 in., with aluminum leaf letters on a black background. Two are used for each train, one placed on the front end and the other on the rear above the window to the right of the center line of the car. The train numbers stay in place from the time the car leaves the carhouse until it returns to the carhouse, while it is on the same train run.

A clear and more definite system of route and destination sign is under consideration. The report favors roller signs adjustable from within the car, rather than metal roof and dash signs, because the former can be changed only if some one climbs to the roof, and both require more trouble to change the car from one route to another.

CARS AND SPECIAL WORK

A low-floor car designed to facilitate the rapid handling of passengers was recommended. One-man cars have been found too slow for operation in the congested area and to cause additional delays. The report recommended two-car units for mass transportation, particularly for operation on heavy lines. For the lighter lines which run through the congested area a one-man-two-man car was recommended to supersede the safety car

for conditions existing. These cars would operate with one man except during rush hours.

The report also urges the addition of more special trackwork, so that the opportunities for turnbacks and for maintenance of service by diversions during emergencies may be increased. On some lines the skip stop or alternate stop plan is now in force, and it is recommended that the same plan be extended to all lines.

Statistics on Twelve Large Properties

STATISTICS showing a comparison between six of the largest surface lines and an equal number of rapid transit properties are presented herewith. They afford an interesting comparison of these figures with the figures which show the results of the electric railway industry as a whole, as published in *ELECTRIC RAILWAY JOURNAL*, on page 578, of the March 31, 1923, issue.

While the 121 companies covered in the analysis on March 31 produced gross earnings of over \$393,000,000, the twelve city properties under consideration showed a total of over \$316,000,000, although they operate only one-ninth of the track mileage in the United States. Of these twelve properties, six are classed as rapid transit, although only three operate elevated or subway lines exclusively, the other three being in combination with surface lines. Each of the twelve companies collected over \$8,000,000 in its last fiscal year and its average receipts exceeded \$26,000,000. The prevailing rate of fare varies, three charging 5 cents, two 5 cents with a 2-cent transfer charge, one 5 cents with a 1-cent transfer charge, four 7 cents and two 10 cents, while in some cases the company sells tokens at a lower rate.

Gross earnings of the six surface properties show a decrease of 3.5 per cent below the previous year, while operating expenses, including taxes, decreased only 1.6 per cent. For the rapid transit companies the increase in receipts was 1.7 per cent and the decrease in cost 6 per cent. The operating ratio for the surface group averaged 83.34 per cent, as against 85.08 per cent in the previous year, and ranged from 68.93 to 93.35 per cent. The average for the rapid transit group was 71.63 per cent, ranging from 59.08 to 83.03 per cent, compared with an average of 77.92 per cent in the preceding twelve months. Considering only the three roads which operate subways or elevated lines exclusively, the operating ratios average 69.17 per cent, as against 75.9 per cent in the previous year.

The total passengers per mile of single track operated showed an increase of 0.89 per cent for surface companies and 4.7 per cent for rapid transit lines. The number of passengers per mile of track in the former group ranged from 929,650 to 1,940,456, and in the latter group from 1,263,286 to 1,463,592. Several companies, however, do not keep account of transfers and free passengers and for that reason the figures shown are low. On the surface lines, less service was rendered by each car in the past year than in the preceding year, the annual miles operated per car averaging 34,877, as against 35,862. On rapid transit lines

STATISTICS PER CAR-MILE AND PER CAR-HOUR ON TWELVE LARGE ROADS

	1919	Six Surface Roads 1920	1921	1922	1919	Six Rapid Transit Roads 1920	1921	1922
Transportation revenue per car-mile.....	38.9 cents	44.7 cents	47.8 cents	47.8 cents	33.1 cents	38.0 cents	40.7 cents	40.8 cents
Expenses and taxes per car-mile.....	32.5 cents	37.6 cents	43.2 cents	43.2 cents	25.9 cents	30.6 cents	33.4 cents	31.1 cents
Transportation revenue per car-hour.....	\$3.26	\$4.00	\$4.03	\$3.14	\$4.21	\$4.63	\$5.21	\$5.14
Expenses and taxes per car-hour.....	\$2.75	\$3.37	\$3.62	\$3.64	\$3.25	\$3.70	\$4.13	\$3.81
Operating ratio, per cent.....	83.06	87.45	85.08	83.34	74.00	77.26	77.92	71.63

there was an increase, the figures being 39,271 for the last year against 38,557 in the preceding year.

Revenue passengers on surface lines increased 1.1 per cent and the car mileage was less by 0.55 per cent. On rapid transit lines the number of passengers increased 3.3 per cent and there was an increase of 1.7 per cent in service. The average car-miles per car-hour on surface lines increased 1.1 per cent over the previous year, while the rapid transit lines remained the same. The figures just given used to be considered as an index of speed performance, but in recent years car-hours have been so augmented by contract requirements that it is no longer regarded as of much value. The figures given above as well as those contained in the table are for the twelve largest companies, five of which have a fiscal year ending June 30, while the others have a fiscal year more nearly corresponding to the calendar year.

Rapid Transit Parkway Proposed for New York

For Outlying Sections, with Track on Surface, Commission Engineer Declares Cost About Same as Elevated and One-Third that of Subway

AN ACCOUNT was published on page 572 of the issue of this paper for Oct. 6 of a rapid transit parkway line, recommended as part of the New York Transit System by Daniel L. Turner. The report of Mr. Turner goes into considerable length as to the advantages of this system over an elevated or subway line for undeveloped portions of a city. Briefly, the plan consists of a reservation strip approximately 500 ft. wide with two or four tracks in the center and vehicular, overhead or under crossings about every third or half mile. The right of way would be divided as shown in the accompanying section.

Mr. Turner points out that such a line would have all the advantages of an elevated line, in that it is in the open air, and also the advantages of a subway in

that it does not disfigure the streets or cut off light and air from abutting property.

As regards cost, Mr. Turner estimates that such a line, including real estate in suburban territory, would be slightly more expensive to build than an elevated line, but considerably less costly than a subway, based on the figures of \$2,300,000 per route-mile for a two-track subway line and \$700,000 per route-mile for a two-track elevated line. For everything except real estate for a two-track parkway line, built either in open cut or on embankment or as an elevated railroad, as best suited to the topographical conditions, Mr. Turner allows \$500,000 per route-mile and believes that the real estate for a 400-ft. wide strip could be secured for \$400,000 a mile and if 100-ft. wide for \$100,000 a mile. The approximate unit cost figures, including real estate for a two-track structure, would be as follows:

	Per Route-Mile
For a two-track subway line.....	\$2,300,000
For a two-track elevated line.....	700,000
For a parkway line through a 400-ft. wide strip costing \$400,000.....	900,000
For a parkway line through a 100-ft. wide strip costing \$100,000.....	600,000

In his remarks on cost Mr. Turner says: "The conclusion seems inevitable that through undeveloped country, instead of building elevated lines as we have done in the past, the parkway line should be built, a wide parkway line if possible, but in any event a narrow parkway line, and that the land necessary for such parkway should be obtained in advance and held until the building of the rapid transit line becomes necessary."

In discussing the matter of assessment of cost, Mr. Turner says that while the New York State law provides for local assessment for rapid transit lines, based on the enhancement in land values, no rapid transit line has yet been built under the assessment plan. Nevertheless, an assessment for a parkway is a common procedure and should meet with no obstacles of any kind, particularly if the parkways are to be of the width and importance that a strip approximately 400 ft. wide would permit to be developed, thereby bringing the parkway within a half mile of everybody living within the area developed in such a manner.

Section of Suggested Parkway Line for Rapid Transit Development in Outlying Sections of New York

Remodeling a Power Plant to Improve Performance

Batavia Station of C., A. & E. R.R., Twenty-two Years Old, with Changes Costing \$11 per Kilowatt, Has 12 per Cent Lower Water Rate and 30 per Cent Less Maintenance—Capacity Also Is Increased About 10 per Cent

This View of the Engine Room Shows the High-Pressure 7,500-Kw. Turbine Under Repairs

EXTENSIVE changes have been going on in the Batavia power plant of the Chicago, Aurora & Elgin Railroad for the past year, the idea being to improve the efficiency of the station. While the work is not yet fully completed, the results to date indicate that evaporation will be bettered approximately 9 per cent, and the turbine and engine water rates will be decreased approximately 12 per cent. The maintenance budget for the last half of 1923 is almost 30 per cent less than maintenance expenditures for the last half of 1921, before the new work was started. On this reconstruction H. W. Brooks acted as consulting and construction engineer.

Though not an original objective of the work, the output of the rehabilitated equipment has been increased about 2,000 kw. Line drops and distributing losses have been decreased materially, while the railway schedule has been speeded up and the service made more frequent. The possibility of service interruption has been reduced to a minimum. The plant as remodeled, if kept in a reasonable state of repair, should render effective service for at least ten to fifteen years at economies comparing favorably with the average ob-

tained in modern plants of equal size. Based on the station capacity the entire cost of the work will not exceed \$11 per kilowatt. Including the new line and substation work the total unit cost will not exceed \$15.

The original station, installed in 1901, consisted of three 1,500-kw. and one 1,800-kw. engine generators driven by 32x64x60-in. cross-compound Corliss condensing engines at 75 r.p.m. This equipment was augmented in 1912 by a 7,500-kw., 1,500-r.p.m. condensing turbo-generator and a 3,000-kw., 1,500-r.p.m. low-pressure condensing turbo-generator. All this generating equipment is rated liberally, however, in comparison with present standards, tests having proved the continuous 40-deg. capacity of the station to be about 18,000 kw., with 22,000 kw. obtainable on the swings. Three-phase, 25-cycle current is generated at 2,300 volts. Each generator is connected through a separate bank of transformers to the station 26,300-volt, three-phase bus, and all switching is done on the high-tension side.

In the boiler room there are eighteen 5,000-sq.ft. water-tube boilers equipped with chain-grate stokers. Steam is now generated at 200-lb. pressure and 150 to 200 deg. superheat.

Four boiler settings were excavated beneath so as to lower them, their stokers, hoppers and accessory equipment by 4 ft., thus increasing the height of the combustion chamber from 8 to 12 ft. This permitted increased combustion efficiency, particularly with the long-flaming, high-volatile southern Illinois and Indiana screenings burned. The method of excavation was found more economical than the more usual plan of raising the boilers.

The natural draft stokers on these four boilers were

replaced with forced-draft chain-grate stokers equipped with side-wall tubes and pressure water bags. With the forced-draft stokers the fluctuations of the load, which are especially heavy in railway service, are accommodated readily through the greater inherent flexibility of this type, while the steady base load is carried by the natural-draft boilers at their most efficient rating.

While the furnaces were being rebuilt it was considered advisable to reconstruct the old baffles, which were of the standard type, nearly vertical, replacing them with inclined baffles, thus tapering the gas passages to follow as closely as possible the reduced volume of the gases with their shrinkage at lessening temperatures. The lower entrance velocity aids the draft and

relieves clogging of the gas passages by slag present in large quantities in the Illinois and Indiana screenings. Two different types of baffles were installed for competitive purposes, the interlocking tile type with plastic joints on two boilers, and monolithic baffles shot with a cement gun on the other two. The aggregate found most satisfactory for the monolithic baffles consisted of two and one-half parts of ganister screened through $\frac{1}{8}$ -in. mesh with one part of portland cement and one part of ordinary fire clay.

Experiments were made to determine the correct amount of excess air to be introduced and the correct location for orifices. Dampers or grates will be placed over these orifices later and calibrated in such a manner that the firemen always will know what setting to employ with a given fire condition and steam flow.

A number of other changes have been made in the boiler room, such as the installation of d.c. motors to drive the forced-draft stokers, fans and damper machines; the design and installation of coal spreaders in some of the stoker hoppers to cut down the labor cost of firemen and to produce uniform fuel beds; installation of recording meters and draft gages, including a trial installation of the Lea recording coal meter to give a continuous boiler check on pounds of steam per pound of coal.

Eight superheaters were installed to obtain decreased engine and turbine water rates possible with superheated steam at approximately 550 to 600 deg.

A large portion of the pneumatic ash conveyor system was replaced with a new steam-jet system for the purpose of reducing operating and maintenance costs. White iron ash conveyor pipe 1 in. thick was used, with a joint somewhat resembling Vanstone construction. Five boiler water deconcentrators and a feed water filter in the make-up line were installed to minimize boiler cleaning and upkeep expense. All cast-iron fittings, valves and screwed flanges in the boiler and engine leads were removed and replaced with steel fittings and valves and Vanstone flanges to withstand superheated steam.

Heat insulating materials were used to cover all steam and hot water lines, boiler drums and heads, etc., to cut down the heat losses in transmission.

The 7,500-kw. turbine was completely rebladed and repaired to place it in efficient operating condition, and the cast-iron head was replaced with a new steel head

Cast-Iron Valves and Fittings Were Replaced by Steel Parts in the Engine Room

Interior View of Furnace Looking Toward the Arches

to permit the use of the increased temperature. A desuperheater and attemporator were designed and constructed for the purpose of automatically maintaining the temperature in the main steam header opposite the reciprocating engines at a point not in excess of 500 deg. F. at all conditions of flow.

The turbine-driven hydro-flow air pump on the main turbine condenser was replaced with a twin two-stage steam-jet air removal pump with inter and after condenser and the consequent halving of steam consumption necessary for air removal. A small automatic dual drive exciter set was installed for the purpose of constantly and automatically maintaining a station heat balance. A 750-gal. per minute boiler feed pump driven by a variable-speed motor was installed with automatic constant pressure differential speed regulating control. Under the load conditions prevailing computations proved a power saving of 17 per cent by the use of speed regulating control of the motor as compared with throttling control of the pump.

The station bus was redesigned and reinforced, as were the cables and wiring, the present output having outgrown the capacity for which they were designed.

A 1,000-kw. frequency changer was added to permit handling additional 60-cycle commercial load until an increase makes necessary additional 60-cycle generating capacities. Two 1,000-kw. full automatic rotary converter substations were also installed, with all necessary equipment, making possible faster and more frequent railway schedules at a minimum expenditure for labor.

In addition to the major items there were scores of minor changes, repairs and additions effected. All boilers were turbed and washed and a fixed cleaning schedule established. Masonry in furnaces and settings was placed in first-class condition, all steam or water leaks were sought out and eliminated, valves

were repacked and ground, auxiliary turbines, engines and motors repaired and placed in first-class operating condition, main engines gone over in detail and completely rehabilitated wherever necessary. A complete new system of power house logs and accounting was introduced, which makes possible a much more accurate prediction of the annual maintenance budget or subsequent new construction budgets.

As not all the items of new equipment are yet in service, nor has the operating personnel yet had time to become so intimately acquainted with all details as to be able to say what maximum results are to be obtained, definite figures just at this time are not available. The general conclusions stated at the beginning of this article have, however, been definitely established.

What It Costs to Operate an Auto

CONSIDERABLE interest has recently been manifested by electric railway men in automobile operating cost figures for use in telling the owners how much they save by leaving their automobiles at home and riding the electric cars. L. S. Cowles, writing in the *Stone & Webster Journal*, gives figures throwing some light on the subject. The following is abstracted from his article:

Any driver knows that with "gas" at 20 cents per gallon and his car making 10 miles per gallon the fuel cost is 2 cents a mile. Beyond this, few care or take the trouble to go. When you see a Pierce-Arrow roll by with a chauffeur at the wheel, you may know at once that such an outfit is costing the owner from 50 to 60 cents per mile traveled. For small annual mileage, say 4,000 miles, the cost per mile may easily exceed \$1. Few would believe this without analyzing the situation carefully. A few exact figures bearing on the actual cost of operating one particular car will enable one to get some idea of operating and maintenance expense.

ANNUAL STATEMENT OF MOTOR CAR OPERATION June 11, 1922, to June 11, 1923

Make	Bulck
Model	22-44
Type	Roadster
Total miles traveled	6,114
Operating and repair cost (not including replacements):	
Interest	\$35.61
Depreciation	355.02
Registration	10.00
Driving license	2.00
Fire and theft insurance	12.50
Liability insurance	46.69
Personal property tax	22.56
16.75 gal. engine oil	15.91
405 gal. gasoline	113.95
Two carbon burnings	9.00
Repair labor	74.18
Tire repairs	6.65
1.75 gal. transmission oil	1.82
Tire powder	.20
One can "tar remover"	1.00
Two bottles body polish	1.45
Cheesecloth	.15
One can leather dressing	.75
One can nickel polish	.90
Distilled water	.10
One flashlight bulb	.20
Three 21-cp. lamp bulbs	1.50
Three 2-cp. lamp bulbs	.90
12 lb. grease	2.60
1.75 gal. alcohol	1.50
One roll friction tape	.35
Two flashlight batteries	1.00
Battery charge	1.20
Cotton waste	.90
Total	\$720.59

Cost per mile operated:	
Fixed charges	63.80
Operating fees	0.196
Insurance	0.970
Taxes	0.396
Fuel	1.865
Lubrication	0.333
Repair labor	1.470
Miscellaneous supplies and expenditures	0.260
Total cost per mile	11.870

From the above it is seen that fuel cost is a relatively small part of the whole. While no one wants to waste gasoline, the question of high mileage per gallon of gas is not as important as one might at first believe. In the case cited no allowance was included for garage rental and car washing, as these vary with the requirements of the owner.

Some Useful Elements of the Street Railway Philosophy

By W. E. Wood

Manager Houston Electric Company, Houston, Tex.

The Real Interests of the Three Groups in the Public Utility Triangle, Public, Employee and Owner, Are the Same — What the Railway Management Should Do to Bring About Real Co-operation

PHILOSOPHY, as such, is generally conceded to be a dry subject, especially for the practical business man. But in our desire to analyze our business so that we may popularize it and administer it more successfully, we have naturally gravitated into a study of its philosophy. Having got into this study, we have been agreeably surprised to find how beautifully the facts we have always known develop themselves in the most logical fashion.

As a basis of our study we have accepted as true two important facts. A proof of their truth will not be attempted here because of the space that would be required, but surely we could not so earnestly continue to pursue our business if we did not believe them to be true. The assumptions are these:

1. In the heart of every human there is a spark of reason and justice that is capable of being fanned into a flame under proper condition.

Within this assumption lies our hope of obtaining the popular co-operation so essential to a successful operation of our business, for while it is true that we may temporarily lull our public into a quiet state of mind or even make them enthusiastic for us by catch phrases, attractive publicity and the like, if our basic arguments are not founded on "justice and reason," eventually these efforts will surely fail. Then the enthusiasm aroused in our favor will react with most unwholesome results. But if this enthusiasm is based on justice, reason and sincere efforts it is on the firmest foundation on which our industry can stand.

2. Up to the present time private ownership and operation have been capable of rendering street railway service more efficiently and economically than has municipal ownership.

THREE DISTINCT GROUPS INTERESTED IN EVERY PUBLIC UTILITY

Having accepted these two assumptions as true we should next make a careful analysis of the public utility triangle.

There are three and only three distinct groups interested in each public utility. The public, the employees and the owners.

It should be beneficial to determine in what each of these groups is interested and what each may properly expect to receive from the business and from each other.

The Public: By virtue of the fact that the public through its constituted authorities has granted to the utility the right to use certain portions of its property in the transaction of its business, it has a right and does desire and expect to receive from the utility the best practicable service at the lowest possible cost.

The Employee: It is an accepted theory in this country that all employees are entitled, for proper performance of their duties, to receive, and it is their natural instinct to be interested in, fair wages and proper working conditions.

The Owner: Capital is essential to the construction and establishment of public utilities. There could be no reason why any one should become interested in acquiring or investing in public utilities unless he can reasonably expect the capital he so invests to earn a fair return.

So we find three separate and distinct interests, each apparently having a right to expect to derive some distinct benefit from the operation of the utility. Their interests may appear divergent, but a study makes it certain that for each to receive the greatest possible permanent individual benefits their interests must be unselfishly mutual.

The history of our industry clearly indicates that the public and employees will persecute the owners of a utility when they discover that the owners are receiving more than a fair return. Therefore it is to the owners' best self-interest, when the returns exceed a fair amount, with wages and working conditions all that they should be, to return the excess to the public in better service or cheaper rates.

If the public insists on getting its service cheaper than will yield the owner his fair return and the employee his fair wage and working conditions, the utility must fail and ultimately cause the public to receive an inferior service which necessarily becomes more and more expensive to operate. During the period of rising prices of wages and material, caused by the recent war, it was very hard for the public to realize that the above was a fact; however, its truth is becoming more and more apparent to the public every day.

Should the employees of a public utility demand and obtain more than a fair wage and working conditions, either the rate of fare of the service of the public must furnish this excess or it must be taken out of the owner's fair return. In either event the result would ultimately defeat its own purpose.

MUTUALITY OF INTEREST BETWEEN GROUPS

We have recited a few instances which tend to demonstrate the mutuality of interest of the three groups interested in the public utility. Like the axioms in geometry, this fact is so clear and apparent that it is difficult to prove.

The public's manner of expressing its approbation or dislike for the owner or employee is through public attitude.

The employee's method of showing his interest for the owner or public is through loyalty.

And the owners express themselves through their policies.

Believing, as we do, that there is a distinct and invariable mutuality of interest between the groups, then why is there so often controversy between the groups? Employees and owners are frequently at odds. Employees and the public sometimes entertain a healthy disrespect and dislike for each other, and in the immediate past instances of antagonism between the owners and the public were continually arising. Our reasoning shows that such conditions are contrary to the best interests of all concerned. To eliminate them we must first determine their causes.

IMPROPER POLICIES AND LACK OF UNDERSTANDING CAUSES FOR DISAGREEMENT

There seem to be two major reasons why the public's attitude toward the owners is hostile or the employees are disloyal to the owners:

First—The formulation and maintenance of improper policies by the owners toward the public or the employee.

Second—Lack of understanding.

These causes seem to cover every case both in connection with the public's attitude and loyalty of employees. As a rule, where the public attitude is the most favorable, the employees are the most loyal. In this case the owners' policies necessarily approach right, and there is little lack of understanding.

In some cases the employees are loyal yet there is an unfavorable public attitude. This indicates that the owners' policies point right but that the public lacks the understanding of the situation which it has been possible to convey to the employees. In every case it must be remembered that the employees' loyalty is weakened by improper policies toward the public and the public's attitude is adversely affected by the improper policies of the owners toward their own employees.

Continuing the analysis, we find that the owner should weigh his policies to the public in respect to service, publicity, citizenship and expansion.

The owners' policies toward the employee include wages, working conditions and welfare work.

All of the phases are susceptible of a most interesting further analysis.

Now, if the owners' policies toward both the public and employees are right, fair and just, then certainly, if our first original assumption is true, and in some manner we can convince the public of the fairness and justice of our policies, the antagonism will begin to disappear.

Lack of understanding can only be wiped out by the education of both the public and employees concerning utilities in general and the specific utility concerned in particular.

COMPONENTS OF SERVICE

We are studying the street railway business, the most important feature of which to the public is service, therefore special care should be taken in analyzing our service.

Service is composed of: (1) Safety, (2) quantity, (3) personal service (commonly called courtesy), and (4) cleanliness and comfort.

Safety is the first and most important component of

street railway service. When we do not make it so, our widespread catch phrase "safety first" is insincere and therefore a cause of public disrespect. There are so many phases to the study of safety that although most interesting and important, it cannot be considered here.

By quantity of service we mean the amount, frequency, regularity and speed. It should be unnecessary to point out to any street railway man the importance of having an entirely sufficient service with as excellent a standard as possible. It is equally our duty to the public to be sure that this service is rendered as economically as possible in order that it may be given "at the lowest possible cost."

PERSONAL SERVICE RENDERED IS DIFFERENT FROM THAT IN OTHER UTILITIES

The third component mentioned of railway service is personal service. Although we have barely pointed to the importance of safety and quantity of service, we must not in the slightest degree minimize their importance. Service is like a three-legged stool standing on safety, quantity and personal service. If deprived of any of the three legs, it cannot stand. It is difficult to say which leg is the most important, but for fear that the usefulness and spirit of "personal service" may not be fully appreciated we will inquire into this phase more minutely.

To understand to the fullest the place of personal service in street railway service, it is necessary to digress sufficiently to study street railway psychology as compared with that of other utilities. For the greatest contrast we will compare electric lighting with street car service. One enters a dark room and wishes light. A switch is located in the room convenient to the entrance. With a minimum of effort the button is pressed and instantly the room is lighted, and the person unconsciously feels a sense of satisfaction. Psychologically there is nothing in the operation that would prepare his mind to harbor any ill feeling or mistrust for the lighting company. He knows of no substitute at any cost that is comparable in convenience or satisfaction.

But picture a modern man, our friend Bill Jones, a regular patron of the street car service on an ordinary morning's ride to his office. Mr. Jones may or may not be the possessor of an automobile, but surely he is fully acquainted with the comfort and speed they offer and besides can easily forget their small disadvantages. Possibly his family has started him a little late to work. He has to walk two and a half blocks to the car line. Although there is no particular objection to this, he doesn't relish it every morning. He has to wait four minutes for a car, not an unreasonable wait but seemingly much longer, and distasteful. The street car maintains a good average schedule speed to town, but automobiles pass it and, darting in and out of traffic, weave their way to the city in less time. Somehow, the occupants of the automobile look more comfortable to him than he feels. At times a broken truck may delay the street car. Bill Jones is not an unreasonable man, but under these conditions the street car ride furnishes him no real sense of satisfaction and very probably his mind is prepared to entertain some ill feeling or mistrust for the street car company.

So we find that very few people will get pleasure out of street car riding even when the safety and quan-

tity are above reproach. But all is not lost. We have a most effective way of preventing this ill feeling and mistrust from capturing Bill.

By the use of what we have called personal service, even under the conditions mentioned, we can gain his respect and very frequently his active co-operation. The lighting has practically no human contact with Bill, but the street car company has, every time he uses its service. We have commonly called this phase of our business "courtesy." But sincerely based on the golden rule our organization, if it is permeated with the spirit of personal service, can effectively win over Bill Jones. The definition of personal service is:

Those acts of kindness, courtesy, accommodation, attention, favor, respect and consideration which we may render to our fellow man in connection with our business.

Personal service tends to gain a favorable public attitude for the company. For the employee it makes individual friends, creates self-respect, gives the satisfaction of a duty well performed and makes his work more pleasant.

Besides this, if the company's policies are right (and if they are not, the spirit of personal service will be difficult to obtain), this spirit is the surest way of obtaining real co-operation in the utility triangle. Therefore, if there is a mutuality of interest the employees will ultimately be rewarded by better wages and working conditions. We might add, however, by way of warning, that if the personal service is rendered primarily in the hope of a material reward without a sincere desire to live up to the golden rule, it is not likely to be effective enough to gain the material reward.

CLEANLINESS AND COMFORT THE FOURTH COMPONENT OF SERVICE

The fourth component of service mentioned was cleanliness and comfort. Although these may not be as important factors of service as the three others, we feel that their necessity is apparent enough without further argument.

For fear of exhausting the patience of the reader no attempt will be made here to analyze the other factors of the owners' policies to the public, namely, publicity, expansion and citizenship, or to the employee, which can be summed up under the headings of wages, working conditions and welfare. It is necessary clearly to understand the public's and employees' rights and the company's obligations in these respects to "formulate and maintain the proper policies."

REAL CO-OPERATION NECESSARY

What we have tried to accomplish is to show the relationship between the three groups interested in the public utility; to prove an absolute and unchangeable mutuality of interest between these groups, which in turn means that for their own interests there must be a real co-operation between the groups. And, lastly, we have tried to analyze the things the owner, through its management, can and ought to accomplish to bring about this mutual understanding and co-operation.

If we can render a better service more cheerfully by understanding this philosophy, is it not necessary for us to teach and preach it throughout our organization until every one of our employees can better perform his daily duty because he understands how to and believes in the necessity of winning the public?

Concrete Paving of Track in Chattanooga

Tennessee Power Company Is Installing Concrete in Track Area with Excellent Results—Ballast Is Tamped Under Traffic

WITH a view to securing permanently satisfactory results with concrete paving in and between tracks, the Tennessee Power Company, which operates the city railway lines in Chattanooga, Tenn., has lately used the track construction shown in the cross-section, Fig. 1.

The trench for the single track is 9 ft. wide and the bottom is inclined toward a 12-in. x 12-in. drainage ditch in which a 6-in. farm tile is laid. If the soil is soft, 2 or 3 in. of ballast is rolled into the bottom. The trench is about 22 in. deep at the middle and 2 in. less

Fig. 1—Typical Cross-Section of Track for Paved Streets with Concrete Paving Used in Chattanooga

Fig. 2—Grooving Tool for Use in Forming Flangeway in Concrete Paving

Concrete Track Paving in Chattanooga Like that Shown at the Left Is Turning Out Well

at the outside. Broken stone ballast is laid in the bottom to a depth of 8 in. at the middle, on which white oak ties creosoted by dipping one hour in hot oil and one hour in cold oil are laid. Standard 6-in. 100-lb. A.R.A. rail is spiked to the ties.

A concrete paving base with a 1-3-6 aggregate mixed one and one-half minutes is poured between and over the ties, covering them to a depth of 2 in. The concrete base is deepened slightly under the rails by scraping out the ballast before the base is poured.

The paving base is made about 9 in. deep outside of the rails, where, as in the case illustrated, an asphaltic concrete paving is to be laid by the city. Outside the rails the concrete is depressed to accommodate two or more rows of stretcher brick, which are laid on a sand cushion.

The concrete between the rails is 4 in. deep, of 1-2-4 concrete mix, surfaced as indicated in the cross-section.

Contour strips of wood are laid in the rail flangeways while the concrete is soft, and the surface is smoothed by means of a level board. The surface is not crowned. After the concrete has hardened suffi-

ciently to "stand up," the flangeway is smoothed by means of a special grooving tool shaped in the form shown in Fig. 2.

Expansion joints are placed 15 ft. apart, a space $\frac{1}{2}$ in. wide at the top battered to $\frac{1}{4}$ in. at the bottom being left for this purpose. A board with the proper taper is used in forming this joint, and the concrete is mixed with as little water as possible to enable it to stand up when the expansion joint board is removed.

After the removal of the board, a grooving tool, such as is used by sidewalk layers in marking lines in concrete surfaces, is drawn through the groove, slightly rounding the edges. Pitch is poured into the joint after twenty-one days.

The concrete paving and the ballast tamping are done under traffic. Sometimes ten tappings of the ballast are needed when the ground is soft. The tamping is done with ordinary hand picks. Care is taken to see that no flat-wheel cars go over the line while the concrete is setting, and all cars are run during this period at reduced speed.

For the first seven days the concrete is continually wet down to permit uniform setting.

The cost of this work was from \$1.25 to \$1.50 per yard on two recent jobs on Walnut Street and Harrison Avenue. This work was carried out under the direction of R. C. Morrison, engineer maintenance of way Tennessee Power Company.

Moving Platform Tests Show Low Power Requirement

**A Demonstration Plant of the Type of Platform
Recommended for Forty-second Street, New York,
Has Been Built for Tests and Demonstration Purposes**

A Short Section of the Platform Has a Steel Surface and Upholstered Seats of This Type

A SERIES of dynamometer tests has recently been concluded on a demonstration plant of the type of moving platform considered by engineers of the New York Transit Commission for use under Forty-second Street in place of the present shuttle train service. This demonstration plant has been built in Jersey City by the Continuous Transit Company, of which H. St. Clair Putnam is president.

The demonstration plant is constructed in the form of a loop approximately 200 ft. long and 100 ft. wide, with a 50-ft. radius at each end. It consists of three parallel continuous platforms designed for operation at 3, 6 and 9 m.p.h. respectively. The high-speed platform is 57 in. wide, is provided with seats spaced 32 in., holding two passengers each. At 9 m.p.h. this gives a total seating capacity of 35,640 per hour. Each of the lower-speed platforms is 27 in. wide, and there is a stationary walkway path alongside the slowest plat-

form. The total width of the three platforms assembled is 9 ft. 3 in., and the height above the rail is less than 12 in. Each loop is made up of a series of small trucks 8 ft. long with circular ends exactly fitting into each other. The trucks are supported at the rear end by two independent wheels with ball bearings. The forward end is connected to the preceding truck by a universal coupling. The track for the high-speed platform has a gage of 37 in., and for each of the other platforms it is 17½ in.

The general design of the installation is along the lines of a paper read by L. B. Stillwell before the American Society of Civil Engineers on Nov. 17, 1920, and reported in the *ELECTRIC RAILWAY JOURNAL* for Nov. 27, 1920, page 1102, and Jan. 15, 1921, page 124. The most important change in the present demonstration plant from that description is that only the high-speed platform is propelled by induction motor

elements, the other two being driven by racks and pinions. With the induction motor type of drive a stationary element is placed between the rails. This consists of a development of the ordinary primary or stationary part of an induction motor, as shown in the illustration. These sections are approximately 5 ft. long and are placed between the rails in groups about 140 ft. apart. The secondary element is similar to the developed rotor of the squirrel-cage type mounted on the bottom of the truck. It consists of a laminated iron core with punched copper windings. Except for the necessary breaks between the trucks this is continuous for the entire length of the platform. The primary is supplied with three-phase alternating current at $37\frac{1}{2}$ cycles per second for a speed of 9 m.p.h. In the demonstration plant the alternating-current generator supplying the propulsion power is capable of

Under Side of Truck for High-Speed Platform, Showing Induction Motor Secondary Element

for longer platforms of the same type. Tests were made at various speeds in order to determine the train resistance, both on tangents and on the curves. From these tests the train resistance has been worked out, as shown in the accompanying curve sheet.

Average figures show that the train resistance on tangents of the high-speed platform at 9 m.p.h. is approximately 5 lb. per ton empty, and 4.1 lb. per ton fully loaded. The other platforms have a resistance of approximately 6.3 lb. per ton at 3 m.p.h. and 6.7 lb. per ton at 6 m.p.h. when empty and 5.8 lb. per ton at 3 m.p.h. and 6.2 lb. per ton at 6 m.p.h. when fully loaded. It is not expected, however, that large numbers of persons will desire to ride on the slower platforms. The resistance on curves is from two to two and one-half times the tangent resistance.

It is stated that this low train resistance is due largely to the use of ball bearings and independent wheels and to lubrication of the rails. It has been found that this reduces the frictional resistance to a material degree. Rail lubrication is of course possible in the case of an installation of this kind, since the rails are not used for traction.

The average resistance of three loops of moving platforms 2 miles each way in length, which would be required for the Forty-second Street installation, is 6 lb. per ton including curve resistance. The average resistance under maximum load conditions is 5.13 lb. per ton, including curves.

drive at variable speeds in order to change the speed of the platforms.

The two lower speed platforms are similar in type. The racks are continuous, and are mounted on the underside of the platform in the same manner as the secondary element in the induction drive.

In the demonstrations witnessed by representatives of the ELECTRIC RAILWAY JOURNAL, the three platforms have been run at various speeds to determine what will be practicable in service. With the high-speed platform running at 4.5 m.p.h. and the others at 3 m.p.h. and 1.5 m.p.h. respectively no difficulty at all was experienced in getting on or off, or stepping from one platform to the next. This also held true when the platforms were speeded up to 2, 4 and 6 m.p.h. At speeds of 3, 6 and 9 m.p.h., for which the installation was designed, it was necessary to practice getting on or off before facility could be had in it, or in stepping from one platform to the next. It was difficult, however, to trip oneself so that a fall was imminent. It has been suggested that the platforms can be operated at reduced speeds during the non-rush hours, and speeded up for the maximum loads.

The power requirements for this type of platform have been determined from dynamometer tests made by the Electrical Testing Laboratories of New York. Since the platform is continuous and approximately 73 per cent of the track length is curved, this was the only method available to determine the power required

Three-Phase Induction Motor Primary Windings Are Placed Between the Rails

Since there is no power needed for acceleration except at such times as the platforms have to be started, the only power requirement is that for overcoming the train resistance. Running at constant speed the power per mile for the three platforms unloaded is 91 hp., and 114 hp. per mile for maximum load conditions is needed. On this basis the complete double-track loop, required for Forty-second Street, would take 364 hp. unloaded and 456 hp. loaded.

West Penn Center-Door Cars Successful

Interurban Service in Difficult Pennsylvania Section Much Improved Through Use of This Type of Car—Details of Construction and Equipment

A MATERIAL saving in the time required for loading and unloading passengers is the chief advantage found by the West Penn Railways in center-door cars for interurban service. Cars of this type are in use on the 40-mile line between Uniontown and Greens-

burg, as well as on 95 miles of shorter routes on the Coke Region division, and have proved to be much more satisfactory than the end-door cars formerly operated.

The first cars of this type were built with a large two-part two-leaf folding door controlled by a hand-operated mechanism from the center compartment. In the later equipment the door is the same except that it is set flush with the sides of the car and is electrically operated by a Westinghouse 1/12-hp. 250-volt motor. All grab handles close inside of the car, and the doors on either side may be operated from any position within the car. Each door has an independent motor with a cord connection to the operating switch. A three-way snap switch to change the cord control from one door to the other has been installed. Besides these, each door has an independent lever by which it can be manually operated.

The length of the car is 58 ft. over bumpers, and the seating capacity is seventy, the general compartment containing thirty-six seats, the smoking compartment thirty seats, and a small compartment at the center having four more. Standard practice has been followed

This Type of Interurban Car Has Proved Superior to Earlier End-Door Cars on the West Penn System

burg, as well as on 95 miles of shorter routes on the Coke Region division, and have proved to be much more satisfactory than the end-door cars formerly operated.

Physical difficulties of railway operation are great in this territory, due to the fact that it lies among the foothills of the Allegheny Mountains. Grades in some cases are as steep as 12 per cent. Careful operation and strict observance of the rules on the part of employees is necessary for the safety of the passengers and the maintenance of scheduled speed. Stops are well spaced, and attention has been given to the matter of increasing the speed of passenger interchange. During recent years the number of cars on time has averaged from 96 to 98 per cent of the total cars operated.

The West Penn Railways was one of the first companies to use center-door cars in interurban service. In 1910 an experimental car designed by W. E. Moore, general manager, and Daniel Durie, superintendent of equipment, was placed in service. While the original car was crude in a good many details, nevertheless from it has been developed the present standard interurban

car of the company, which is thought to be ideal for the particular conditions prevailing in that territory. All the subsequent cars of this type have been built in the West Penn Railways shops at Connellsville.

The entire interior of the car is finished in cherry except the ceilings, which are enameled in light buff. Artificial lighting is accomplished by thirty 23-watt Mazda lamps, located in two rows, one on each side of the car directly over the seats. The buff color ceiling has been found to be an excellent reflecting surface for these lights.

An outside marker or taillight is a combination of daylight and night stationary fixture with a turning arm inside of the car. Each marker is equipped with green and red glass and a 6-volt 2-cp. lamp on an Edison three-cell 18½-amp. storage battery. The battery is kept charged by a connection through the headlight resistance. In addition to that a lamp of similar size is placed in the center compartment ceiling to show when the trolley wheel leaves the wire. This also makes it pos-

sible for the conductor to keep close track of the marker lights, as they are in parallel with this lamp.

A feature that has been found especially pleasing to the motormen is the front center "clear vision" window. Originally a double glass was used to prevent steaming and frosting during the winter weather, but more recently these have been replaced by a $\frac{1}{4}$ -in. French plate glass, which is far superior to the old arrangement. It does not steam nor frost, gives a clear vision, and is much easier on the operator's eyes.

The cars are equipped with Westinghouse magnetic brakes, which have proved to be very efficient. Truck maintenance costs are said to be considerably reduced and flat wheels are practically unknown. With this type of brake wheels have a very high mileage of service, records of more than 350,000 miles being quite common on the West Penn system.

Zone Passes on Flat-Fare Systems

MOUNT VERNON, N. Y., Nov. 9, 1923.

To the Editors:

Any one who gives the principle of the weekly pass serious thought will find a number of advantages therefrom, not obvious at first sight. Among these is the one which Lawrence H. Doolittle has set forth in his communication "The Weekly Pass as a Simple Zoning Expedient," published in your issue of Nov. 3.

If I understand Mr. Doolittle aright, he suggests passes good within certain sections or zones on what to the cash and ticket rider is still a flat-fare system. In other words, if the standard fare were 7 cents we might perhaps have a universal pass at \$1 and shorter-distance passes at say 50 cents for one zone and 75 cents for two zones. A passholder who rode beyond the bounds, as Mr. Doolittle explains, would not gain thereby. "What goes up must come down" is still true. The passholder would not be likely to go much beyond his boundary, because on the return trip he would either start or end in the wrong zone and thus have to pay the unit cash or ticket fare. This would give a slight reduction in rate only for the occasional long rides.

This plan would not be feasible, of course, on the many systems where there is a combination like pay-leave outbound and pay-enter inbound. The passholder would buy a one-zone pass good in his suburban area. This he would show on leaving outbound or entering inbound, thereby getting the best of it every time.

While Mr. Doolittle has arrived at his suggestions independently, the same plan was set forth two years ago in a confidential report by the writer to a rapid transit company. In this instance, it was also proposed to retain the flat fare for cash and ticket riders but to sell both an inner and outer area pass as well as a universal pass. When one of the operating staff pointed out that the holder of the single-zone pass could override without detection on this all pay-enter system, the general manager cleverly retorted that every station over-ridden meant just as many stations to overwalk on the return trip. The company adopted the pass plan, but refrained from installing the single-zone short haul pass for reasons of policy.

As a student of pass installations, Mr. Doolittle may be interested to know that the distance principle is in effect on at least eight installations in this country. In all these cases, the price of the pass has been shaded downward as the average length of haul increased and the probability of repeating full-length rides decreased. On several of these installations the character of fare collection is such that a passholder could readily override if he wanted to do so, but the fare collection plan automatically minimizes this for the reasons noted hereinbefore. Even in those instances where the cash and ticket fares are zoned, abuse is minimized by the fact that the difference in price between passes is too small to encourage the practice of over-riding one way and paying the cash fare between boarding place and the boundary of the section within which the pass may properly be presented. For instance: With one pass costing \$1, the other \$1.25 and the cash fare 10 cents, it would not pay to do this more than twice a week.

There is no question that short-haul passes would bring more short-haul fares. They do so on the Beaver Valley Traction Company's system, where some of the passes cover sections having no exact relation to the cash fares. They also bring more short-haul fares on systems like Bradford and Doncaster, England, where there are short-haul cash fares as well. The job of introducing the weekly pass would be easier if we had more converts like Mr. Doolittle. **WALTER JACKSON.**

Men Take to Hand Ball in Boston

THE Boston Elevated Railway has constructed a hand ball court in the rear of several of its division headquarters. It is found that the men take a great deal of interest in this game and by its exercise acquire agility and other physical qualities very useful in their daily work. An advantage of the game is that it can be played for a short or long time, as may be desired. Another advantage is that it can be played in winter as

The Hand Ball Court, a Popular Place for Exercise Between Runs in Boston

well as at other times of the year, if only a little trouble is given to removal of snow in the court.

The hand ball courts in Boston are laid with a concrete floor and cost from \$1,000 to \$1,500 each to install, depending upon conditions. Four or five have been built, and it is the policy of the company to erect them whenever a carhouse is rebuilt, if there is sufficient ground for their installation.

Association News & Discussions

Relations Between Motor Bus and Trolley Car Outlined

National Chamber of Commerce Committees
Issue Long-Awaited Reports on Economies
of Transportation by the Various Agencies

EARLY this year, it will be remembered, President Julius H. Barnes of the United States Chamber of Commerce appointed five special committees of the chamber to report on various topics in connection with transportation. It is the intention to call a transportation conference at which these reports are to be considered. The topics selected for these committees were: (1) Governmental relations to transportation; (2) railroad consolidation; (3) readjustment of relative freight rate schedules; (4) highways and motor transport; (5) co-ordination of rail and water service.

As will be noted, the report of Committee 4 is the report of closest relation to electric railway companies. The report of this committee has just been made public, as has also a report of a special joint sub-committee, appointed by the chamber to consider the subject of the taxation of transportation agencies. Abstracts follow of the portions of these reports of particular concern to electric railway companies.

Relation of Highways in Motor Transport to Other Transportation Agencies

The committee appointed to consider this subject represented all branches of transportation service and was made up as follows: Alfred H. Swayne, chairman, vice-president General Motors Corporation, New York; W. J. L. Bannham, general traffic manager Otis Elevator Company, New York; L. W. Childress, president Columbia Terminals Company, St. Louis; D. C. Fenner, engineer and manager Public Works Department, Macks Trucks, Inc., New York; Gerrit Fort, vice-president Boston & Maine Railroad, Boston; Philip H. Gadsden, vice-president United Gas Improvement Company, Philadelphia; W. H. Lyford, vice-president and general counsel Chicago & Eastern Illinois Railway, Chicago; Ralph H. Matthiessen, president Motor Haulage Company, New York; John D. Miller, president National Milk Producers' Federation, New York; H. H. Raymond, president Clyde Steamship Company, New York; Arthur T. Waterfall, vice-president Dodge Brothers, Detroit; Henry J. Waters, editor *Weekly Kansas City Star*, Kansas City; R. C. Wright, general traffic manager, Pennsylvania Railroad, Philadelphia.

In the introduction to its report, the committee, after referring to the rapid development of the passenger motor car and the motor truck, says that inevitably this rapid growth of a new transportation facility has had its effect on the old facilities. Inevitably there has been, and still is, misunderstanding and conflict in the fields of the old and the new facilities, and the old ones are only at the beginning of a readjustment of their activities to meet the new conditions. Meanwhile, the new facility, with inadequate organization and often with little knowledge of its own operating costs, has, in some cases, attempted to handle traffic for which it is not fitted, thus producing an incorrect popular impression as to its proper rôle in our national transportation system. There is already evidence of a tendency to a better understanding of this rôle and toward increasing co-operation of the motor with all other carriers. The present report points out ways further to effect this co-operation. ways in which this co-operation can be effected.

RÔLE OF THE MOTOR TRUCK WITHIN THE TERMINAL AREA

There are three principal directions in which the motor truck can serve to relieve the present terminal situation. These are:

1. By organized cartage instead of the present go-as-you-please method of receipt and delivery at the rail terminal; further than this, by store-door delivery, which is the real completed transportation.

2. By a substitution of motor service for a part of the rail service. This would cover trap car l.c.l. freight service to industries and in a large measure similar movement in interchange as between local stations.

3. By complete elimination of certain rail service. This would cover intra-terminal movements, such as movements between industries or different plants of the same industry within the terminal area, which would then be handled by motor truck.

RÔLE OF THE MOTOR TRUCK OUTSIDE OF THE TERMINAL AREA

The committee believes that where a good highway exists the motor truck has the advantage over the steam and electric railway for distances up to 10 miles in some instances and 25 miles in

others, and that beyond 50 miles under certain conditions and 150 miles in others railroads would generally have the field. This leaves a competitive zone with a lower limit of 10 to 25 miles and an upper limit of 50 to 150 miles, with which each form of transportation has certain advantages, and the shipper should be free to make his choice with due regard to cost, time of transit, reliability of service and other considerations. Primarily, the question is one between steam railroad and motor vehicle, but in certain districts, notably in the Middle West and in California, freight movement by electric railways has been highly developed, so that electric railways are interested in this situation, as well as in the question of competition of motor buses in passenger service.

Altogether the estimated ton mileage of the electric railroads in 1922 is approximately 1,000,000,000, as compared with 340,000,000,000 for the steam railroads. Probably the ton mileage by motor trucks considerably exceeds that by electric railways. Because of the greater flexibility of the electric cars compared with the steam train and the lower overhead due to the smaller investment in terminals, the electric railway can in many instances handle package freight profitably for distances below the economic limit for steam railroads, thus widening the competitive zone as between the electric railway and the motor truck. The possibilities in the use of electric railways in the handling of freight have not as yet been fully appreciated, even by electric railway companies themselves, and a large development of this field may be expected in the future.

COMPETITION IN PASSENGER TRANSPORTATION

Competition of the motor vehicle with the steam and electric railways for passenger traffic divides primarily into two classes—that carried by buses and that carried by the private automobile. Whatever inroads the private automobile has made upon the carriers are inevitable and the carriers must adapt themselves to the new conditions. Bus service may be classified as (1) tourists' service; (2) de luxe service in urban districts; (3) non-competitive service; (4) feeder service to rail carriers and (5) parallel competitive service.

There can be little question as to the desirability of free play in the development of motor service for any of the four classes first mentioned. The fifth class, however, offers a more serious problem. The questions to be answered here are: Is the service of the rail car-

rier adequate and satisfactory to the public? If not, can the rail carrier make it so?

In some fifteen states the Public Service Commission already has authority to grant or refuse to grant certificates of public convenience and necessity to such prospective motor operators. It is wise for the commissions to have this authority as it will afford the existing railroads adequate protection.

The standards by which the merits of any medium of passenger transportation must be judged are:

1. Ability to render safe, adequate and satisfactory service in an efficient manner under all prevailing conditions.
2. Cost of the service.

COMPETITION UNDESIRABLE

There is now quite general agreement on the part of public officials and transportation experts in the automotive and electric railroad fields who have studied the problem that the two forms of passenger transit—motor vehicle and electric railway—cannot permanently exist in a community and pay their way in competition with each other. Furthermore, there exists today an almost unanimous opinion among those who are qualified to judge that the motor vehicle may be used to supplement the electric railway service in such a manner that the transportation needs of the community will be most efficiently met by the provision of a complete system of transportation, under the supervision of a single reliable agency, rather than by individual transportation units.

The problem must be analyzed from the standpoint of the requirements of the entire community. There may be instances where buses, operating in competition with steam and electric railways, have so flourished as to give rise to the feeling that the new medium was the more economical unit. That condition arises primarily because the bus most frequently operates over what may be termed "preferred routes," where the traffic density is greatest and the length of haul shortest, but without regard to the needs of the community as a whole.

On the other hand, nearly every large urban electric railway company has lines which are at present unprofitable to operate. They may reflect bad judgment on the part of an earlier management, or shifting population that has taken away traffic they once had, or they may have been built under public compulsion. In any event, the companies have heretofore been compelled to continue to operate these lines, with a resultant drain upon the revenues from their more remunerative lines and a lessening of their ability to render adequate service to the entire community.

It seems reasonable that in such a case the railroad company should be permitted to substitute bus for rail operation, or that if an independent bus company be granted a certificate of convenience and necessity to operate a parallel service substantially similar in

quality, the railroad company should be permitted to abandon the unprofitable rail line.

The Federal Electric Railways Commission, appointed in 1919 to make a nation-wide investigation of the electric railway situation, declares: "It is clearly in the public interest that all common carriers engaged in local transportation service should be required to render adequate and safe service, and that local transportation facilities should be developed in the most economical and effective way from the point of view of the community. Unnecessary and destructive competition ought not to be permitted, and the community at large should conserve the established facility that still is and promises to continue for an indefinite period the principal means of local transportation."

It is believed that the electric railway is the best medium for the mass transportation of passengers, and should be the foundation of the co-ordinated transit system of the whole community.

It is, however, recommended that a thorough study be made of the problems involved in the handling of the transportation of passengers within the terminal areas, with special reference to public and private passenger carrying vehicles.

RELATION OF MOTOR TRANSPORT TO HIGHWAY DEVELOPMENT

The motor truck did not find its place in national transportation until the war, and as it was during that period and the one immediately following that highway engineers were forced to cut down maintenance, it naturally followed that a question arose as to the ability of the engineer economically to maintain the road under the new traffic. Studies of the cost of highway maintenance have been made by the Bureau of Public Roads, in conjunction with the State Highway Departments in California and New York, and have brought to light certain facts in regard to the effect of traffic on road wear. They have shown, for example, that a "light" truck with an abnormal relation between sprung and unsprung weight, a heavy overload, or too narrow or worn tires, may cause much more damage to the highway than a so-called "heavy" truck. Other factors affecting maintenance are comparative density of traffic, speed of travel, width of axle rather than gross load, and the comparative type of the highway and its condition. While a heavier sub-base is being used now in highways, it is impossible to say for how much of this heavier design the motor truck is responsible and how much of it is attributable to the increase in motor traffic of all kinds.

REGULATION OF MOTOR CARRIERS

The committee believes there has been a growing recognition during the past few years of the principle that one engaged in the business of common carrier by motor vehicles should be subject to regulation as to its rates or service just as any other common carrier.

Unregulated competition of motor-bus lines with electric railways, or of several bus lines with each other, may temporarily give increased service or lower rates, but inevitably it will result in decreased earnings and a lowering of the standards of service, until one or all of the competitors are faced with ruin. Under proper regulation, intelligently and fairly applied, such as has been adopted in a number of states, the extent to which competition is desirable in the public interest rests with the regulatory body. Destructive rate cutting is prevented, and duly authorized motor vehicle common carriers are accorded the same protection given to other public utilities, this at the same time providing the greatest measure of useful service to the public. Through judicious regulation, and only in this way, will it be possible to obtain efficient, economical and adequate co-ordination of motor transport and electric or steam railroads.

Federal regulation of interstate common-carrier motor transportation has not as yet been adopted, but it is believed that it is necessary.

Municipal regulation of common-carrier motor service frequently interferes with the effectiveness of this form of transportation, particularly where such municipal regulation conflicts with regulation by the state.

The principle of regulation by state regulatory bodies of intrastate traffic has been quite generally accepted in this country, and is believed to be sound, as applied to motor vehicle common carriers as well as to other public utilities.

The scope of the regulatory powers of the utility commissions varies widely in the several states. The following outline covers broadly the powers which have been vested in these commissions for the purpose of public supervision of common carriers:

(a) Power to grant, refuse to grant, supplement and amend the right to operate.

(b) Determination of the amount upon which, in fairness and justice to both the investor and the public, the enterprise should be allowed to earn a return.

(c) Establishment of rates or systems of rates which will yield sufficient revenue to meet all operating and overhead charges, including a reasonable rate of return to the investor.

(d) Power of regulation in respect to all matters affecting conditions and character of service, including extensions and improvements.

The right to operate common-carrier motor vehicles, similar to that to operate an electric railway or other public utility, should be contingent upon the granting of a certificate of public convenience and necessity. In considering an application for such a certificate, the state commission should take into account, as the commissions now do in the states where the motor vehicle is under their jurisdiction, the extent and quality of service rendered by the existing agencies, the desirability of intro-

ducing new competition or forcing existing agencies to curtail or discontinue their operations—in short, the public interest in the premises.

If a certificate is granted, the operator should be compelled to furnish ample evidence of financial responsibility or else carry insurance adequate to cover all injuries to persons or damage to property resulting from negligent operation.

Where motor transport, particularly by passenger buses, appears to answer the public need most fully, it is believed that other forms of common carriers should be permitted to install such service as an adjunct to their lines. They are now prevented by the laws of some states, and it is believed that such laws should be repealed.

SIZE, WEIGHT AND SPEED RESTRICTIONS

The enormous development of the motor vehicle, during the past ten years, not only in numbers but also in size and weight, has introduced a number of very perplexing problems with respect to the construction and maintenance of highways and the supervision of traffic on the highways. The increased wear on highways due to the increasing use of heavier and faster vehicles has resulted in the adoption by most of the states of size, weight and speed restrictions.

At the present time there is no uniformity in these restrictions, and this results in serious inconvenience and hardship on individuals and companies operating in more than one state. The weight restrictions in some states are rather indefinite, some specifying gross weight of vehicle and load, enumerating maximum permissible weight on four wheels and six wheels and stating distance between axles, while other states in addition to the above restrict the maximum load per inch of tire. It is believed that there should be uniform size, weight and speed restrictions in all states and municipalities, provided that, where conditions demand, seasonal restrictions, lower than those normally enforced, should be prescribed and administered, under proper safeguards, by the state authority.

CONCLUSIONS

The committee makes extended recommendations, among them the following:

"The best interests of the public and the rail, water and motor carriers lie in co-operation between the various agencies of transportation rather than in wasteful competition.

"To insure to the public continuity and reliability of service, sound financial organization of motor transport is necessary, as well as public regulation of common-carrier motor service.

"Passenger bus transport should be so regulated as to secure the best service to the public, certificates of public convenience and necessity as already required in many states being a useful means of insuring reliable and continuous service. Rail lines can often advantageously extend or supplement

their service by bus lines, and in states where this is now prohibited such restrictions should be abolished."

Report on Taxation

The sub-committee appointed to consider this topic was made up of the following: George A. Post, chairman Geo. A. Post Company, Inc., New York; A. J. Brosseau, president Mack Trucks, Inc., New York; Roy D. Chapin, chairman of board Hudson Motor Car Company, Detroit; W. R. Cole, president Nashville, Chattanooga & St. Louis Railway, Nashville; Gerrit Fort, vice-president Boston & Maine Railroad, Boston; Philip H. Gadsden, vice-president United Gas Improvement Company, Philadelphia; W. H. Maltbie, attorney-at-law, chairman committee on special taxes, American Electric Railway Association, Baltimore. An abstract follows:

TAXES PAID BY TRANSPORT AGENCIES

Statistics show that in 1913 the Class I steam railroads of the country paid \$118,386,859 in taxes, as compared with \$322,300,406 paid out in dividends. In 1921 these railroads paid \$275,875,990 in taxes and \$298,511,328 in dividends. The taxes exceeded the dividends in 1920 and 1922. The steam and electric railways and motor transport in 1921 paid more than 8 per cent of the nation's total taxes of approximately \$9,000,000,000.

In 1921, in addition to these taxes, Class I steam railroads expended \$756,413,690 for maintenance of way and structures, charging the sum to operating account. In the same year the electric railways paid in taxes and imposts \$92,033,000. In addition they paid approximately \$101,000,000 for maintenance of way and structures, charging the same to operating account. Motor vehicle owners paid in 1921 on the vehicles \$75,000,000 in personal property taxes, \$115,500,000 in special federal excise taxes, \$147,000,000 in special taxes applied directly to the construction and maintenance of public highways, and in addition large sums to various municipal taxes, corporation and business income taxes and other property taxes, for which no figures are available.

DIFFERENT METHODS OF TAXATION

Consideration of the different methods of taxation in ordinary use leads to the conclusion that it is impossible to recommend any one of them as ideal or equitable for the taxation of common carriers.

A frequent method of taxation of common carriers is ad valorem taxation; that is, a taxation rate applied to an investment or valuation basis. This is largely an attempt to apply the old general property tax, in use in the early days of this country for the taxation of lands and of simple personal property, to complex and widely distributed economic units, manifestly in form unfitted for such methods of taxation.

It is now admitted by most taxation

experts that the most equitable method of taxation for public utilities is that based upon earnings or income.

A graduated tax on gross earnings depending on the relation of net to gross was recommended by the New York State committee on taxation and retrenchment, in its report submitted March 1, 1922. This system has been designated the "gross-net" tax, and the committee recommends it as sound in principle, and one which should be applied to steam and electric railways and as far as practicable to motor vehicle common carriers. The details of such a tax scale would have to be worked out with much care in order that each form of transportation shall bear its just share of the requirements for public expenditures.

Such a tax has the elements of a sound tax, in that it has certainty, reasonableness and simplicity, while at the same time the state in each case will be assured of at least some revenue from each corporation.

This tax as applied to steam railroads and electric railways should replace the multiplicity of taxes at present levied upon them, including federal taxes on capital stock and income, and the various state and local taxes, such as franchise taxes (of different forms in each state), ad valorem taxes, taxes on gross earnings and on capital stock, annual licenses, special franchises, local real estate and personal property taxes. The gross-net tax should replace all of these taxes.

There are undoubtedly difficulties to be overcome in the application of the gross-net tax system. One of these is the allocation to the various political units of the gross and net earnings of interstate carriers on which the tax must be computed. The committee believes, however, that an equitable method of allocation can be devised.

Under the diverse bookkeeping methods employed by the small companies and by individuals who comprise the bulk of the highway transport common-carrier operators of today, practical administration of a gross-net tax is impossible. Pending common-carrier regulatory control which will place the earnings of these carriers upon a comparable basis for taxation, the committee believes that such increases should be made in the taxes now levied against the common-carrier motor vehicle as will bring its charges to an amount equitably proportionate to those that may be assessed against the other carriers.

It is recognized that this recommendation segregates common-carrier motor vehicles not only from private cars which have no gross or net earnings, but also from motor trucks used as private carriers and not subject to public control.

CONSTRUCTION AND MAINTENANCE OF HIGHWAYS

The report then gives the sources of money for the highway program for 1921, according to the United States Bureau of Public Roads, as follows:

AMOUNT AND SOURCES OF HIGHWAY BUDGET, 1921

Source	Amount	Per Cent
Bonds.....	\$417,817,208	39.0
General state and local taxation.....	381,091,542	43.9
Miscellaneous.....	88,919,158	
Gasoline tax and registration fees.....	109,154,226	10.2
Federal and forest road aid.....	74,679,897	6.9
Total.....	\$1,071,662,031	100.0

Of the \$853,844,823, representing all of the money above except that raised by bonds, the sum of \$183,000,000 came from special taxes assessed against the motor vehicle and the balance from general and miscellaneous taxation.

Continuing, the committee says that it frankly accepts the motor vehicle as an essential addition to the transportation agencies required in our modern economic life. It follows that improved roads to carry the motor vehicle are equally necessary. These highways are free to the general public, and are built out of general public funds just as are schools, parks and many other improvements essential to the public health and welfare.

In the case of steam and electric railways the investment in roadway is a capital account, and returns on this investment are paid out of income, but on the other hand the steam and electric railways have certain franchise rights in the use of their roadway. Since the motor vehicle derives a special benefit from the improved highway, the committee believes that it should bear the entire expense of maintaining these roads in as good condition as when they were built, even where this involves resurfacing or reconstruction of the same type of road. In addition to a maintenance tax, highway transport common carriers should pay a tax in exchange for franchise rights comparable to those owned by the other carriers.

By paying the cost of maintenance of the highways which it uses, the motor vehicle puts itself on an equality as to maintenance with the steam and electric railways, which pay for the maintenance of their own way and structures through direct charges to operation instead of by taxation.

The committee does not believe, however, that the motor vehicle should be burdened with a special tax for the maintenance of roads not suitable for motor use.

RECOMMENDATIONS

In conclusion the committee makes the following recommendations:

"1. Each form of transportation should bear its fair share of the burden of public expenditure.

"2. Taxation of common-carrier transportation agencies should be simplified as far as possible.

"3. Taxes on regulated common carriers operated for hire should bear a definite relation to gross and net earnings rather than to invested capital.

"4. This requirement can best be met in the case of steam and electric rail common carriers by the imposition of a gross-net tax in lieu of the present levies. Pending full regulation of the

motor common carrier, such increases should be made in taxes now levied against it as will bring them an amount equitably proportionate to that which may be assessed against the other carriers.

"5. The entire cost of maintaining the improved highways of the country should be borne from special taxes levied against the road user. Such taxes should be used for no other purpose.

"6. Co-ordination of highway construction and maintenance under centralized administrative agencies is urged to eliminate waste and secure efficiency."

Car Weight, Stability and Tires

AT THE fifteenth annual congress of the Tramways & Light Railways Association, held at Swansea, Wales, on June 21 and 22, W. E. Ireland, rolling stock engineer London County Council Tramways, presented a paper on "Electric Tramway Rolling Stock," dealing with the subject from an engineering point of view. He considered first the desire to produce rolling stock of lighter weight and the factors involved. In regard to double-deck cars, a prime essential was to determine what was to be top-deck load, bearing in mind stability of the car and its ability to resist overturning by wind pressure or by centrifugal force on curves. There had also to be considered strength of pillars, rails, etc., to resist vertical load due to weight of passengers, side stresses and members, the thrusts due to acceleration and retardation. It had to be appreciated that top-deck passenger loads will reach 6,440 lb. or more, added to the weight of the roof cover, say 3,700 lb., making a total of 10,140 lb. Tables were given showing the centrifugal force in pounds in case of a fully loaded car weighing 20 tons at speeds from 1 to 15 miles per hour and on curves of from 45 ft. to 100 ft. radius and total pressure resulting from a wind with a velocity of 60 miles an hour on side of car.

The application of these forces on a car fully loaded on the top deck only was shown, and from this came the deduction that to render the car stable sufficient weight must be introduced into the lower parts to balance forces acting above the center of gravity. The method of locating the center of gravity and determining the weight to be put into the lower parts of the car was illustrated by diagrams. In reference to the forces acting on the ends of the car, Mr. Ireland said that in order to provide a sound foundation and also additional support to vertical members the steel underframe had proved most successful, as it provided the necessary support in both vertical and horizontal directions and rendered the use of a truss rod unnecessary. The parts to resist stresses in their nature determined their own weight. Regarding the top-deck cover, loads were small and stresses limited, so that the structure

could be designed in the lightest possible way. With respect to adding sufficient weight to the lower parts of the car to bring the center of gravity to a predetermined position, in some cases it had been found necessary to increase the cross-section of truck sides considerably beyond that required for strength.

Coming to the question of single-deck cars, Mr. Ireland referred to efforts made in America to reduce weight and quoted weights of some single-deck cars in the United States and of double-deck cars in Britain in order to show that the weight per seat was much less in the latter case than in the former. Taking the bogie cars in use in London, Manchester and Birmingham (narrow gauge) weights per seat were respectively 423 lb., 393 lb. and 569 lb. A single-deck car, in which the question of stability introduced less complication than in the case of double-deck cars, could be designed in much lighter material than a double-deck car of equal carrying capacity. Mr. Ireland showed a form of body which while giving ample resistance to stresses lent itself to lightness of construction, and also a design for single-deck coupled cars in which the weight of all members would be reduced to a minimum. The body would be supported directly on axle boxes through long laminated springs, with spiral springs between the links and underframe, thus dispensing with the usual form of truck. The motors would be suspended from the underframe and the drive to the axles would be by a silent chain. The axles would be forged hollow, so as to reduce the unsprung weight. The estimated total weight of such a car was 9,520 lb., or 244 lb. per seat. Provision would be made for automatic application of the brake gear in event of cars parting. Two independent systems of mechanically operated brakes were intended to be provided in cases where magnetic brakes were not used.

Mr. Ireland in the last part of his paper dealt with the subject of wear of tires, on which for the last three years he has carried out research work. His conclusions were published in the *ELECTRIC RAILWAY JOURNAL* Aug. 18, 1923.

Chamber of Commerce Begins Accident Campaign

THE Insurance Department of the Chamber of Commerce of the United States has just begun issuing a series of bulletins designed to assist local chambers of commerce and other civic organizations in conducting accident prevention campaigns. This series has been started on account of the serious public accident situation, which has become worse since the general introduction and use of motor vehicles. According to a statement by James L. Madden, manager of the insurance department, nearly one-fifth of all accidental deaths are now attributed to automobiles alone. The Ford Motor Company reports that of every sixteen fatal accidents experienced by its em-

ployees, only one occurs during the performance of duty. The other fifteen are the result of public accidents which the industrial safety measures established by the company do not prevent.

The first bulletin of the series, just issued, gives in considerable detail the activities of the Safety Division of the Milwaukee Chamber of Commerce, which is carrying out an ambitious program for assisting in the development of public and industrial safety. Methods of planning a safety organization and safety campaign are given.

Fall Meeting of the American Welding Society

THE fall meeting of the American Welding Society was held at the Fort Pitt Hotel, Pittsburgh, Pa., Oct. 24-26. In addition to the regular sessions of the society, meetings of the electric arc welding committee and of the board of directors of the American Welding Society were held and several inspection trips were made to neighboring industrial plants. At the industrial application session a paper was presented on the application of welding and cutting to industrial work. This included a description of various classes of work which have been done by the electric arc, oxyacetylene, resistance and thermit welding processes. Slides were shown illustrating practical work accomplished. The methods and illustrations relating to the electric railway field have already been published in previous issues of the *ELECTRIC RAILWAY JOURNAL*.

Utility Commissioners to Meet at Miami

THE thirty-fifth annual convention of the National Association of Railway and Utilities Commissioners will be held in Miami, Fla., beginning Dec. 4, and will last four days, according to an announcement by President Dwight N. Lewis.

The national association is an organization comprising all the railroad and public service commissions of the different states and the District of Columbia, together with the Interstate Commerce Commission and the commissions of Hawaii, Porto Rico and the Philippines. There is now a regulating commission in every state in the Union excepting Delaware.

The sessions of the convention will be devoted mainly to the presentation and consideration of reports from committees, and will include such topics as public ownership and operation; safety of operation of railroads and public utilities; the questions of service, rates and demurrage; express companies in their relations to the railroads; grade crossings; capitalization; motor vehicle transportation; telephone depreciation; valuation of railroads; and statistics and accounts. A special subject for discussion is the super-power movement, which has gained great headway in the last few years. Herbert Hoover, Secretary of Commerce, who has been

one of the leaders in this movement, has been invited to address the convention. The discussion will be led by Hon. W. D. B. Ainey of the Public Service Commission of Pennsylvania.

Representatives of the railroads and other public utilities will be heard during the convention. Addresses will be delivered by Donald D. Conn of the American Railway Association, Carl D. Jackson and M. H. Aylesworth of the National Electric Light Association,

J. B. Clumpp, president of the American Gas Association, and James P. Barnes of the Louisville Railway, representing the American Electric Railway Association.

Other questions to be considered will be the regulation of motor vehicle transportation, the valuation of the railroads by the Interstate Commerce Commission, elimination and protection of grade crossings of railroads and telephone depreciation.

American Association News

Bases for Valuation Compared*

BY L. R. NASH

Stone & Webster, Inc., Boston, Mass.

IT IS not without significance that the committee on valuation now goes further than it did in 1919 in stating that it was strongly influenced in its recommendations by the fact that the courts have up to this time consistently held that present cost of reproduction must be considered. Obviously when seeking the protection of the courts, the methods which they adopt must be followed whether or not they appear most appropriate under existing circumstances.

In spite of the unbroken line of court decisions so far on record on this subject, it does not necessarily follow that some change with respect to public utilities may not be made because of special regulatory practices affecting them but not other industries subject to competitive influences. The Southwestern Bell Telephone case, referred to in the committee's report, occasioned a sharp division among the justices, disclosed in a dissenting opinion which presented in an able and forceful manner the advantages of prudent investment as a rate base. Although this basis was rejected in that case and in more recent Supreme Court cases, the actual recognition given in leading cases to present cost of reproduction as compared with investment has not been wholly encouraging up to this time. In no decision of last resort has present cost of reproduction been the sole measure of value, and in many cases fair value has been so brought down by averaging unit prices over a period of years, or by deductions for depreciation, or both, that the final finding of value has been but slightly higher than actual investment.

Regulatory commissions are still more strongly inclined to adhere to investment as the basis of return in rate cases. It is possible that a sufficient number of further decisions of our leading courts reversing this practice of the commissions would lead to their general adoption of the reproduction method as controlling. This process, however, would require a considerable period of years, during which, it is to

be expected, there will be some decline from the present level of prices to a level much below the maximum prevailing in the post-war period, during which a large amount of public utility construction was necessary. If a few years hence construction prices have fallen to a level 50 per cent above the pre-war level, they will still be at least 33½ per cent below the peak prices prevailing in 1920. It is, therefore, conceivable that actual investment may not only approach consistency with reproduction cost, as pointed out in the report, but that it may materially exceed it after a period of years. A strict adherence to cost of reproduction might, therefore, in time work to the disadvantage of at least some utilities and holders of their securities.

It will be of interest to make certain assumptions as to the future level of prices affecting public utility properties and the growth of these properties to determine when, if at all, the cost-of-reproduction method will cease to yield a value higher than the actual investment. For this purpose a public utility has been assumed having, in 1913, 10,000 units of property, each with a value of \$100 and, therefore, representing a total value (assumed to coincide with investment) of \$1,000,000. Each year there is added to the property a number of similar units equal to 5 per cent of those then existing. Such an assumption is not inconsistent with the history of progressive public utilities. Next there has been determined the annual weighted average prices of units such as those assumed, and estimates have been made as closely as possible of the future movements of these prices. The prices of materials entering into public utility properties are now substantially higher than the average of all commodities. While the reasons for the discrepancy will in part continue, it is to be expected that there will be a tendency toward greater consistency within the next few years, after which a decline in public utility and other prices will continue at about the same rate as the increase which occurred during the period from 1896 to 1913 and the decrease during

*Abstract of written discussion on the report of the A.E.R.A. valuation committee.

the preceding period which began about 1878. The rate of change in these periods was about 2 per cent per annum. It may appear inconsistent with the discussion and conclusions of the committee's report to assume a reduction in public utility construction costs continuing after they have come into accord with general prices, but such reduction is, nevertheless, anticipated by many well-informed people, and it is at least permissible to determine the results of such possible reduction.

The above assumptions are all embodied in an accompanying table which

crease in the former but a far less regular change in the latter. The cost of reproduction increases rapidly up to 1920, after which there is an actual decline in spite of the annual increase in number of property units, which decline is not overcome for several years. It appears that in 1938 the investment begins to exceed the cost of reproduction, the excess increasing from year to year. It follows under the assumptions made that if public utilities, either voluntarily or through unreversed regulatory action, are limited to return on the investment for the next fifteen

the rate of growth were more rapid than that assumed in the accompanying table, the investment would overtake the cost of reproduction at an earlier date. If, for example, the property units increased at the rate of 10 per cent per annum instead of 5 per cent, the investment would exceed the cost of reproduction within ten years.

If the prices of public utility materials fail to decline materially during the coming years, the investment would not equal cost of reproduction until a later date, if at all, depending upon the trend of prices. If, on the other hand, the decline is sharper than that assumed, the investment would overtake the cost of reproduction more promptly. Computations in which prices are assumed to have fallen to 150 in 1930 instead of 1933, as in the accompanying table, show investment overtaking cost of reproduction within ten years from now instead of fifteen years.

The uniformity in rate of growth, assumed in the accompanying table, does not represent the facts, particularly during the period of most rapid price fluctuations. Prior to and during our participation in the World War there was an enforced curtailment of construction except where required for war purposes. During the following years of continued business activity and also of maximum commodity prices, it was necessary for many public utilities to undertake an exceptionally large amount of construction, and so the effect of peak prices upon investment becomes more pronounced than under the assumptions of a uniform growth. It follows that under such circumstances investment will overtake reproduction cost at an earlier date.

It is to be noted also that no deductions have been made for accrued depreciation from any of the figures compared in the accompanying table. A study of rate decision shows very few cases where deductions have been made from investment for depreciation, but a comparatively large number in which such deductions are made when the reproduction method is used in determining value. If, therefore, it is assumed that cost of reproduction figures are generally subject to such deductions and actual costs are not, there is a further tendency for investment to show an earlier advantage. Actual investment overtakes the cost of reproduction, shown in the accompanying

Relative Trends of Investment and Cost of Reproduction, Public Utility Valuation

shows for a series of years from 1913 to 1940 the number of units in the property, the current costs of these units, and the actual investment, starting at \$1,000,000 and increasing from year to year by the current costs of the added units. There has then been computed the cost of reproduction of the entire existing units in each year at the prices then prevailing. The figures shown are not exact, being obtained by slide-rule computations.

The columns of total investment and cost of reproduction show a steady in-

crease in the former but a far less regular change in the latter. The cost of reproduction increases rapidly up to 1920, after which there is an actual decline in spite of the annual increase in number of property units, which decline is not overcome for several years.

It follows under the assumptions made that if public utilities, either voluntarily or through unreversed regulatory action, are limited to return on the investment for the next fifteen

PUBLIC UTILITY VALUATION—RELATION OF COST OF REPRODUCTION TO INVESTMENT
(5 per Cent Increase in Property Units per Annum)

Year	Total	Number of Units Annual Additions	Current Unit Costs	Investment		Cost of Reproduction	Year	Total	Number of Units Annual Additions	Current Unit Costs	Investment		Cost of Reproduction
				Total	Annual Additions						Total	Annual Additions	
1913	10,000		\$100	\$1,000,000		\$1,000,000	1927	19,800	945	\$166	\$2,698,000	\$157,000	\$3,280,700

1918	12,760	605	195	1,391,000	118,000	2,488,000	1932	25,390	1,210	152	3,559,000	184,000	3,859,000
1919	13,400	640	205	1,522,000	131,000	2,748,000	1933	26,660	1,270	150	3,750,000	191,000	3,999,000
1920	14,070	670	225	1,673,000	151,000	3,166,000	1934	27,995	1,335	148	3,948,000	198,000	4,143,000
1921	14,755	705	185	1,804,000	131,000	2,734,000	1935	29,395	1,400	146	4,152,000	204,000	4,291,000
1922	15,515	740	180	1,937,000	133,000	2,794,000	1936	30,865	1,470	144	4,364,000	212,000	4,444,000
1923	16,290	775	195	2,088,000	151,000	3,178,000	1937	32,410	1,545	142	4,583,000	219,000	4,600,000
1924	17,105	815	185	2,239,000	151,000	3,165,000	1938	34,030	1,620	140	4,810,000	227,000	4,764,000
1925	17,960	855	175	2,389,000	150,000	3,144,000	1939	35,730	1,700	138	5,045,000	235,000	4,940,000
1926	18,855	895	170	2,541,000	152,000	3,206,000	1940	37,570	1,790	136	5,289,000	243,000	5,103,000

table and chart, in 1929 if the cost is reduced by 15 per cent for depreciation.

It would not be unreasonable, in the light of the above data, to predict that with only partial recognition of present cost of reproduction, which still prevails, and the deductions for depreciation which may be made because of such recognition, this basis of value will yield higher results than actual investment during only a few more years, after which its exclusive use would not be advantageous even if permissible.

This discussion, with its accompanying data, is not presented for the purpose of discouraging reasonable attention to cost of reproduction but to point out that investment should not be ignored. The report recommends that both these evidences of value should always be presented in rate cases as has been the general practice in the past.

Before the war the simplicity of the investment basis, which did not differ radically from cost of reproduction, had its appeal to both utilities and commissions. During and following the war departure from this basis was necessary to maintain the credit or solvency of many companies. A rate of return within the limits which the commissions felt free to authorize would not, when applied to investment, yield a return attractive to new capital. Other companies, however, passed through the war period with satisfactory rate adjustments without claims for value higher than investment.

With return to more stable economic conditions this basis should show increasingly favorable results, but, as the valuation report points out, cost of reproduction cannot safely be ignored whether it be greater or less than investment.

Publicity Committee Activities

BROAD plans for closer co-operation between the American Electric Railway Association and the state committees on public utility information have just been announced by Secretary James W. Welsh.

The outstanding feature of the new plans is to have a member of the committee on state and sectional co-operation in each state where there is a state committee on public utility information who will see that electric railways co-operate not only with the state and sectional association, but also with the state committees on public utility information. James P. Barnes, as chairman of the committee, already is bringing about closer co-operation, and the committee has arranged to have several speakers at state and sectional meetings in the near future. It is planned to have a speaker representing the American Association at each of these meetings throughout the coming year.

Representatives on the committee were chosen after conferences between W. H. Sawyer, chairman of the committee on publicity, and the directors of state committees. Other recent ac-

tivities of the committee on publicity include:

A special interurban drawing designed to decrease crossing accidents has been reproduced on posters for hanging in car windows, waiting stations and elsewhere, and also on a postcard. Both posters and postcards are now being offered to the industry.

A special sticker for manufacturers' letters declaring that the manufacturer is dependent largely on electric railway sales for his business, and that the recipient as a customer of his should do all he can to help the electric railways, has been prepared and distributed. These stickers have proved very popular and orders for 50,000 already have been received.

The award of the special committee on inspection of exhibits at the Atlantic City convention, which was to determine what manufacturers were entitled to certificates of participation in the good-will work of the manufacturers, has been made. Certificates have been awarded to 115 companies, and the advertising section now is having the certificates signed and will place them in the manufacturers' hands in a few days.

The November issue of *Truth* has just been issued to the extent of 3,000 copies. Subjects with which it deals include Secretary Welsh's remarks regarding the increase in car riding; a story showing how it costs New York City taxpayers more than 10 cents to carry 5-cent passengers on the Staten Island trackless trolley; co-ordination of buses with electric railways; the decision of the Manchester (England) board of trustees that buses cannot perform the major traffic service; a human interest story regarding the introduction of new double-entrance cars in Brooklyn; the need for better vehicle laws; and the fact that workmen pay an average of \$4 apiece in special taxes through railway fares which the companies do not get.

Important subjects on which the committee on publicity plans to produce advertising material include general interurban and tax problems and Xmas shopping between 10 and 4 o'clock. Work on material for the last-named problem is now under way.

New Members

THE following applications for membership in the American Electric Railway Association were approved by the executive committee at its recent meeting:

The Decatur, Champaign, and Bloomington & Normal divisions of the Illinois Power & Light Corporation.

Continental Secret Service, Philadelphia, Pa.

Keystone Lubricating Company, Philadelphia, manufacturer of lubricants.

For associate membership: Parsons, Klapp, Brinckerhoff & Douglas, New York, N. Y.

Newman Saunders & Company, Inc., New York, N. Y.

Ten applications for individual membership in the various associations were also approved.

A.E.S.C. Special Trackwork Committee Meets

THE second meeting of the sectional committee on specifications for special trackwork materials and design of 7-in. plain girder rail of the American Engineering Standards Committee was held Nov. 7 at the headquarters of the American Electric Railway Association, New York. After considerable discussion the report of the sub-committee on scope was adopted in the following form:

1. *Title of Specifications*—Specifications for special trackwork materials.

2. *Definition of Special Trackwork*—All rails, rail structures and fittings, other than plain unguarded track neither curved nor fabricated before laying.

3. *Principal Structural Items in Special Trackwork*—Switches; mates; frogs; crossings; guarded, curved and fabricated rails, etc. Appurtenances and fittings for the preceding items, such as plates, rods, fillers, braces, knees, guards, risers, stops, springs, housings, clips, bolts, nuts, washers, rivets, etc.

4. *Principal Materials in Special Trackwork*—(a) Rolled rails: tee, plain girder, girder grooved, girder guard. These rails may be of bessemer carbon steel, open-hearth carbon steel or manganese steel. (b) Rolled shapes: steel, iron. (c) Forgings: steel, iron. (d) Castings: gray iron, malleable iron, carbon steel, manganese steel.

5. *Specifications*—Existing specifications of A.R.A., A.R.E.A., A.E.R.E.A., A.S.T.M., M.T.S., etc., to be used as far as applicable.

6. *Steam Railroad and Electric Railway Special Trackwork*—Specifications to include all special trackwork for whatever use and of whatever type or gage, including steam railroad use in all services, including use in paved streets, electric railway service, storage battery, gasoline engine or any other motive power; industrial and mine tracks.

7. *Authority of Committee*—It is recommended that the tentative report of the sectional committee be submitted for information and suggestions to the track committee of the A.R.E.A. and the committee on way matters of the A.E.R.E.A. before final action is taken.

8. *Designs for Plain Girder Rails*—It should be understood that the designs are not necessarily to be confined closely to the weights of 90 lb. and 91 lb. for such rails as given in the assignment of the subject.

Those present at the meeting were: V. Angerer, chairman; R. C. Cram, vice-chairman; C. A. Alden, E. B. Entwisle, G. L. Fowler, H. H. George, E. P. Roundey, E. M. T. Ryder, J. B. Strong and G. C. Hecker.

Maintenance of Equipment

Close Fitting Trolley Ears Reduce Line Maintenance Cost

By G. H. MCKELWAY

Engineer of Distribution Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y.

WITHIN the last few years manufacturers of overhead line material have brought out round top hangers designed so that the ear can be screwed up snugly against the under side of the hanger. This construction is a great improvement. With the old design there was no certainty that the ear would be brought up close to the hanger, and after installation, the ear usually would have to be backed off a part of a turn to make it line up with the trolley wire.

The advantage of a tight fit and the damage that occurs to both the hanger and the ear by their slight relative movements if they are not securely fastened to each other can be seen by an inspection of the scrapheap. On one property I found from 50 to 75 per cent of the hangers were scrapped because the threads on the studs were so badly worn by movement that it was unsafe to reinstall them after they had been taken down, or to screw a new ear to them after the old one had been pulled off.

WORN THREADS LIMIT SERVICE

Many hangers with shells and insulation in splendid condition are made useless by worn threads, and years of additional service could be obtained if the studs were in good shape. In nearly all cases the ears attached to the hangers must be thrown away too, because of worn threads and not because of lips worn away or other defects.

Before the tight-fitting feature was added to round top hangers, good results were obtained by using either the cap and cone or "West End" hangers. With both of these types, however, there was liability of the stud unscrewing from the ear and letting the wire sag down. The turning of the stud can be prevented by the use of a lock washer, but this adds another part to the hangers, which are already composed of three

parts, too many for quick and easy installation.

One engineer, seeing the advantage of keeping the ear close to the round top hanger, proposed making the hub of the ear thinner than was customary and dishing it out at the top. The outside rim of the hub would then bend down enough under pressure to permit twisting the ear another half turn. It would be necessary, however, to line up the ear if it should be out of line with the hanger. This plan was put into practice only to a limited extent and not enough to give it a conclusive trial.

The higher cost of the new design of hanger may seem to be a formidable objection, but careful consideration will show that there is a saving rather than a loss by the use of the newer type. If the old hanger costs 75 cents, and the new one 85 cents, and as not more than fifty-seven of these hangers are needed per mile, the increased cost will be only about \$5.50 or \$6 per mile.

The increase of life to be expected from the newer hangers over the ordinary type is at least 50 per cent and in some cases perhaps 100 per cent, so that the increased cost of 13½ per cent is more than offset by the saving. The ears when worn out will weigh 17 or 18 ounces and their scrap value is about 14 cents, at the present price of scrap copper. There will also be some saving in the number of ears, owing to the fact that a new car has to be installed practically every time a hanger is replaced. The percentage of such ears to the total number used will be very small, probably not more than 5 or 10 per cent, so that the saving on ears will reduce the difference in cost of the hangers by only about 3 cents.

The installation cost is still to be considered. If all of the hangers on a line are replaced at one time, this would be comparatively low, but the replacement of defective hangers is not done that way and often the line crew has to make a run of several miles, taking an hour or two of their time in order to replace a

single hanger. Even under much better conditions it will be easy to calculate that the labor and trucking cost, whether the latter includes the use of horses, auto trucks or cars, will reach 50 cents for each hanger installed, and if that low amount be added to the other costs it will be found that the new type of hanger will cost only about 5 per cent more than the old type.

How Car-Type Resistors Can Be Standardized

AMONG the items of car equipment in which standardization will effect material reductions in the number of spare parts required for maintenance, grid resistors offer attractive possibilities. Railway systems using many types of equipment

Fig. 1 — Standard Frames of 3-In., Three-Point Grid Resistors. Note That All These Frames Are of the Same Length (Thirty Grids) and Use Only Two Sizes of Grids

experience trouble and expense in maintaining resistors due to diversity in sizes and types. Under these conditions, according to the Westinghouse Electric & Manufacturing Company, a program of resistor standardization is practicable and will result in desirable saving in maintenance costs.

The ideal resistor equipment would be one in which grids of only one size are mounted in one frame, varying the number of these complete units on a car to suit the different motor and control equip-

Fig. 2—Class "D" Standard Resistor. Made Up of One No. 1 Frame and One No. 2 Frame. Fig. 3—Class "J" Standard Resistor. Made Up of One No. 2 Frame and Two No. 3 Frames. Fig. 4—Class "C" Standard Resistor. Made Up of One No. 1 Frame, One No. 2 Frame and Two No. 3 Frames

ments. With many types of motor and control equipments on various types of cars, it is usually impossible to carry the standardization thus far, due to the capacity requirements and the various numbers of controller steps sometimes used on one property. The standardization usually can be carried to a point where not more than two different sizes of grids are employed. When more than one size of grid is required to provide for different equipments the individual frames should be designed, if possible, so as to use only one size of grid, i.e., with one current capacity and resistance value.

ONE SIZE UNITS DESIRABLE

A desirable arrangement provides a group of standard resistor units all of the same frame length, so that from this group certain frames could be connected in an assembly to give the required acceleration and current carrying capacity to any particular car equipment. It is possible to get an assembly suitable for each type of motor and control equipment by using other combinations of frames from this group of standard resistors.

Fig. 1 shows four typical standardized frames in which, however, only two styles of grid are used. Frames 1 and 3 use style A grids connected respectively in series and in parallel, and frames 2 and 4 use style B grids, similarly in the series and the parallel arrangements. From these four frames combinations such as those shown in Figs. 2, 3 and 4 can be assembled for various motor equipments.

In applying this plan a number can be assigned to each standard

resistor frame. Then in case of failure of grids it is only necessary to remove the defective frame and replace it by another of the same number, making the proper connections of resistor leads as shown on the car wiring diagrams. The car is then again ready for service. The damaged frame can be repaired later in the shop.

As a result of the decrease in types and sizes of grids that must be carried, this practice saves considerable investment in stock. In addition repairs can be made more quickly. The cars are therefore not kept out of service awaiting the assembly of special resistor frames. Still another advantage is that standardized resistor grids are readily obtainable from the manufacturer and will enable him to make shorter deliveries.

Beginning with the purchase of a certain lot of cars, the resistor frames for these and later purchases can usually be standardized. To extend this to older cars will, in some cases, require relocating other apparatus. The question to be determined, therefore, is that of selecting the standard frame length that can be applied to all cars, old and new, with the least expense in changing other apparatus under the car. Then the problem is to reduce the number of different grid resistors required to make up the frame to not more than three, and, if possible, two.

The standard resistor frame would provide for one standard tie rod with insulation, one type of terminals, etc., that are a part of the resistor. Further economies can be obtained by standardizing the insulated bolts, the hangers on the car and the method of mounting the resistors.

To carry out such a program, a thorough study of service conditions and requirements for different equipments on a given property must be made. In addition, the various weights of cars, types of motors, types of control, diameters of wheels, gear ratios, etc., must be considered.

Getting Best Results from Lightning Arresters

By R. T. WAGNER
General Electric Company,
Schenectady, N. Y.

DISSATISFACTION with the protection afforded by lightning arresters is usually not the fault of the arresters. Improper installation and lack of maintenance nullify the protective value of any type. When dissatisfaction exists it is advisable to call in an expert so that the maximum benefit can be obtained from the investment that has been made in car arresters.

Users of arresters can, however, do much for themselves by thoroughly investigating the installations along the following lines:

1. Make a careful inspection of all the car arrester equipments and put them in proper mechanical adjustment. Check the coils, gap setting (25 mil gap standard) and resistance rods on the MD and MD-2 types. Inspect the carborundum block of the MP arrester and see that the circuit is continuous down to the arrester and from there to ground. Many of the old arresters are possibly in such condition that they should be removed and replaced with modern arresters, saving any parts in suitable condition for spares.

ROOF MOUNTING BEST

2. If possible to do so, a better installation can be effected by mounting the arresters on the car roof. Here they are away from the wheel wash and road conditions to which they are subject when located under the cars. The roof mounting also makes them more accessible for inspection and thus keeps them in better operating condition. With the under-car location, the only convenient time for inspection is when the car is run in over the pits. Furthermore, when installed on the roof on steel frame cars, a ground can be made right at the arrester, supplemented by the usual ground lead to the motor frame or axle housing.

3. With the gap-type arrester, in particular, some improvement can be effected by using a small choke coil

in the leads to the controllers. This can readily be made up of ten or twelve turns of the line conductor on a wood core of about 6 in. diameter.

4. It is advisable to keep some record of actual failures on car equipments due to lightning, particularly to show the locations on the system where trouble occurs, as well as the nature of the failure and the effect on service. This would give a basis for a more logical analysis of conditions in the future.

5. The d.c. aluminum arrester is the only real solution of the lightning protection problem where severe conditions are met. This type, however, requires a definite amount of attention and has a higher maintenance charge than the gap type. Experience on a large number of 600-volt systems in the worst lightning zones in the country has clearly demonstrated that this extra maintenance and higher cost is more than warranted by the freedom from lightning troubles which this type of arrester insures.

CAREFUL MAINTENANCE ESSENTIAL

On some street railway systems, however, a large proportion of the system is so shielded that severe conditions do not exist and the gap type should give a favorable degree of protection. Further analysis may show that certain lines or sections may require a better degree of protection. The first step would logically consist in giving the present arresters the best possible opportunity of performing their function. Obviously, there is no real advantage in investing in lightning arresters unless the arresters are properly installed and maintained.

The gap type of arrester as represented by the MD-3 arrester, which is the modern type of the MD and MD-2 arresters, is an arrester of limited discharge capacity and subject to the further limitations of any series gap arrester. This gap requires a certain definite voltage to break it down, and up to that point no protection exists. Where really severe lightning troubles exist, the direct current aluminum arrester offers the most nearly perfect protection that can be obtained on street railway work.

It is obvious that with the degree of shielding that exists on some systems there cannot be the amount of trouble from lightning that would occur on a similar amount of trackage and overhead lines in exposed

open country. It is only on exposed sections outside the city that any very serious trouble might be expected. If conditions were such that cars were always operated on given lines, such exposed sections could be given a better class of protection than for the other lines. This has been followed with success in several instances. With the pooling of all equipment and its use anywhere over the system such a scheme is not feasible.

Supplying Sand to Locomotives

A CONVENIENT arrangement of elevated boxes for supplying sand to electric locomotives is used by the Norfolk & Western Railway at Bluefield, W. Va. Six sand boxes mounted on poles are arranged in two sets of three boxes each. These are placed so that the six locomotive sand boxes of a unit can be filled through the cab windows at one time by gravity, using the spouts which hang below the elevated boxes. An accompanying illustration shows the sand boxes and equipment. The sand boxes are filled from a drying room located on the near side of the track not shown in the illustration. The sand is conveyed from the drying room to the boxes by approximately 70 lb. of air pressure through 2-in. iron pipes, marked *B* in the picture. There are three of these riser pipes at the end of the first sand box of each group, one for each box. The distance from the drying room to the sand boxes is approximately 150 ft.

To fill the sand boxes on the locomotive the unit is run alongside and the spouts are placed in position through the cab windows. Valve

handles marked *C* in the illustration open the discharge pipes. The boxes are 2 ft. x 4 ft. x 6 ft. in size.

While receiving sand, the water rheostat used on the locomotive can also be filled. At the point marked *D* on the accompanying illustration there is a large pipe riser with a small horizontal cross pipe. A hose, marked *E*, hangs from this and is used to fill the rheostat.

Repairing Worn Piston Ring Grooves

WHEN the piston ring grooves in compressor pistons become worn to such an extent that a properly fitted piston ring cannot be installed, the New York Railways turns down the end of the piston and presses on a new collar to re-

Proper Fit of Piston Ring Is Made by Turning Down End of Piston and Pressing on a Collar to Replace Metal Removed

place the metal removed. The accompanying illustration shows the method as used in the Fiftieth Street shop. By this method, the collar to be pressed on can be made of such a size as to give an accurate fit of the piston ring and make the cylinder practically as good as new in this respect.

Special Arrangement of Elevated Boxes for Supplying Sand to Electric Locomotives of the Norfolk & Western Railway

The News of the Industry

Battle Promised in New York Legislature

Different Interpretations Placed on the Recently Enacted Home Rule Measure

At the November election the people of the State of New York voted in favor of an amendment to the State Constitution known as the "Home Rule for Cities" measure.

Recently, John H. Delaney, former transit commissioner of New York City, is quoted as having remarked:

We will contend that cities are given the right to regulate public utilities within their boundaries. We will press the Walker-Donohue bills at the 1924 session and claim that by the mandate in the amendment itself the Legislature is required to pass them. The only difference will be that they must be statewide rather than applying only to New York City.

Other authorities are broadcasting the statement that the acceptance of the Home Rule amendment by the people gives each and every municipality the immediate right to regulate utilities located within its boundaries.

Section 7 of the amendment itself, the opening sentence, states:

The provisions of this article shall not affect any existing provisions of law, but all existing charters and other laws shall continue in force until repealed, amended, modified or superseded in accordance with the provisions of this article.

It appears entirely clear to others, however, that unless and until the Legislature itself, in accordance with the constitution and law, modifies or amends present public utility statutes, such laws will remain in full force and effect, and unless and until the Legislature makes special provision for the application thereof, the new powers conferred upon cities will not be effective. That the Legislature of 1923 has something of this sort in mind appears to be evinced by the fact that it authorized a commission to prepare appropriate legislation to put the Home Rule amendment into effect provided it was approved by the people.

The exact status of the situation is this: The ratification of the Home Rule amendment by the people restricts the Legislature from the passage of any law affecting just one city of the state except the Governor recommends such legislation be enacted, and 100 members of the Assembly and thirty-four members of the Senate vote for its passage. There can be no more passage of local bills relating to one particular city on a mere majority vote of the Legislature; there must be a two-thirds vote and the Governor must first recommend its passage.

This means, in short, if the city of Buffalo wants authority to operate bus lines, if the city of Syracuse would

regulate gas and electric companies, if the city of New York would have complete supervision, untrammelled by state control, over the transit situation, the Governor must first recommend such legislation and then two-thirds of the Legislature must concur in its passage.

By the adoption of the amendment the Legislature has been deprived of the right to enact local legislation affecting one city or particular cities having certain population by a mere majority vote and in order to allow Buffalo to operate bus lines must authorize all cities to exercise the same function, but the cities themselves have apparently not gained anything in the way of regulation of utilities within their boundaries unless existing laws are amended and special legislation is enacted to enable them so to do.

Routing with Steam Property Delays Cincinnati Project

The reason has been revealed why the Cincinnati City Council has not acted finally on the ordinance granting the Cincinnati, Lawrenceburg & Aurora Electric Street Railroad a franchise for an elevated structure from Anderson's Ferry to the heart of Cincinnati. Following the announcement of the intention of the city authorities to proceed with the Eighth Street viaduct reconstruction, notwithstanding the defeat of the bond issue for that project at the municipal election on Nov. 6, it was stated that the company's franchise ordinance would have to be revised to fit in with or accommodate itself to the general steam railroad terminal plans now being worked out by the managers' committee.

Stanley Shaffer, attorney for the Cincinnati, Lawrenceburg & Aurora, said it was true that delay regarding the ordinance was due solely to the fact that the routing of the line to co-ordinate with the steam railroad terminal scheme had not been determined, or at least disclosed. Mr. Shaffer, however, pointed out that a rerouting of the interurban line would be necessary only from near State Avenue eastwardly and that the plans already made would stand for that portion from Anderson's Ferry to State Avenue. He said he and his company wanted to "go along with" the general terminal plan, but they do not know what that plan is to be and when it will be possible for his company to proceed with construction. The plans of the interurban company call for the construction of an extension from Anderson's Ferry to Third and Walnut Streets. The elevated structure, a part of the general plan, would be built from State Avenue to Third Street over Mill Creek.

Transportation Systems Again Urged to Co-operate

Mr. Gadsden Urges Tax Reforms — Capital Can Be Obtained Only with Compensatory Rates

National transportation problems will be solved when steam, electric and gasoline systems are co-ordinated and when rates are established which will attract the investor in securities. This was the principal point emphasized in an address of Philip H. Gadsden, vice-president of the United Gas Improvement Company, Philadelphia, and former president of the American Electric Railway Association, before the Cincinnati Commercial Club, Nov. 17. Mr. Gadsden also is a member of a special committee of the United States Chamber of Commerce that recently has completed an extensive study of the national transportation situation.

No attempt should be made to elevate the taxes of motor cars to the present levels of electric railways, Mr. Gadsden said, because railway taxes are unfair.

On this subject of taxation he said that the broad policy to be adopted was not to load down the bus and the truck with taxes, as had been done in the case of steam and electric railways, but that action should be taken to review the whole subject of taxation of public utilities and instead of overburdening the bus and truck with taxation, the steam and electric railways should be relieved of all unjust and unnecessary taxation. He also said there should be worked out a principle of taxation for the public utilities on the basis of property value of franchises. He went on to say that when such equalization by way of regulation of taxation had been brought about the inevitable result would be that the field for the operation of the motor bus and truck would be as an adjunct and auxiliary of existing transportation systems.

Further that the proper solution of the whole problem could be found when it was approached from the standpoint of the economics of the transportation business. He said it was a matter of determining what was best for the country. Viewed from this angle, it meant that a system of transportation really was needed in which the steam railways, electric railways, bus and the truck had a proper and appropriate part to play.

He went on to urge the necessity of credit for effective railway operation. On this point he said that the companies ought to be allowed to charge such rates as will induce new capital to flow into the business.

The real test in the financing in the

last analysis was the investment market, but unless the rate is such as will induce new capital to flow into the industry, the rate was inadequate whatever authority may have fixed it.

He said that transportation was the foundation of our entire business structure and it ought to be the highest interest of all to see that these public servants were kept in strong and effective condition.

Joint Hearing on New York Central Application

A joint hearing will be held by the Transit Commission and the Public Service Commission on Nov. 26 on the application of the New York Central Railroad for the relocation of its tracks on the west side of Manhattan and for an order specifying the electrification of the company's lines south of Spuyten Duyvil.

The petition of the company seeks the relocation of its west side tracks under the general change of grade law which provides that one-half of the cost shall be borne by the company and one-half by the city and state. The company's petition to the Public Service Commission relates entirely to its obligation to electrify all its lines in the city under the provisions of an act passed by the last Legislature.

The hearing before the commission, which will be open to all individuals and organizations, is required by law and must be held upon not less than ten days notice to the company.

Public Service Speakers' Bureau
